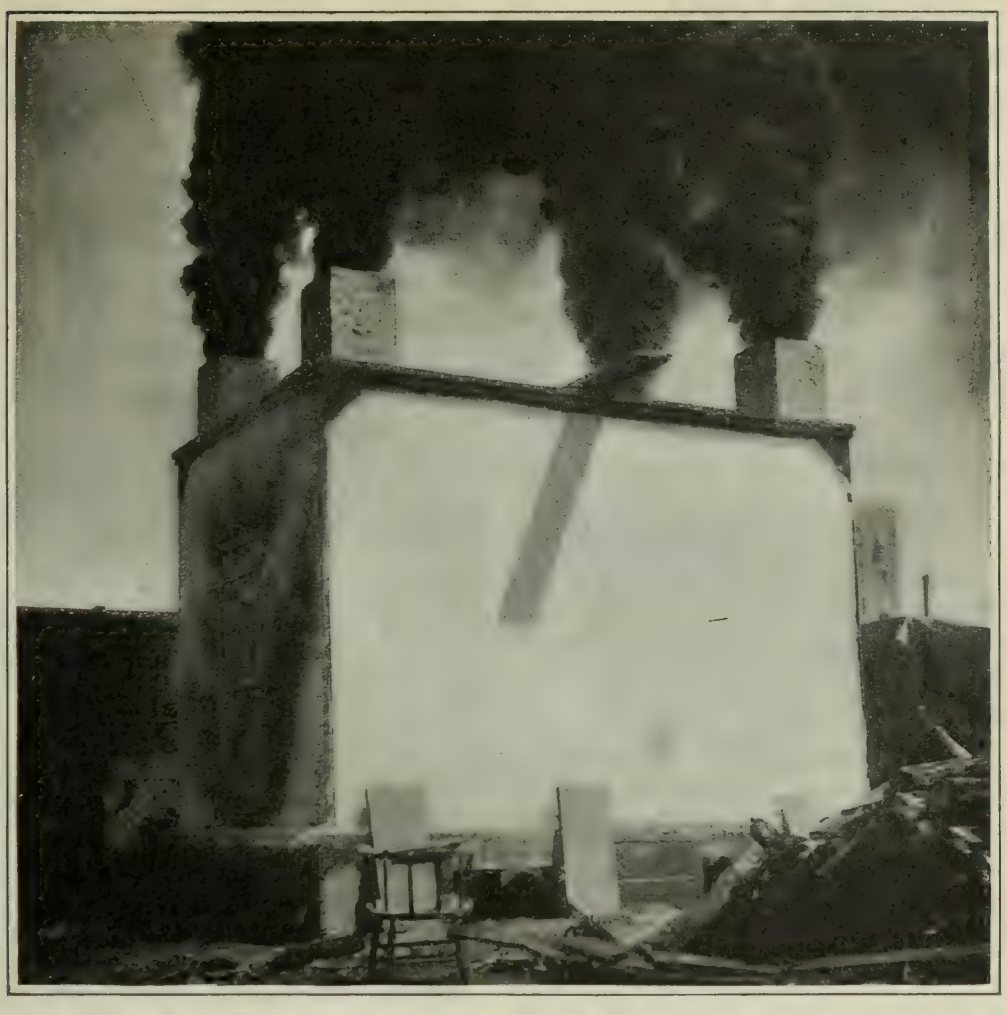
For the first time in the history of the country we are exporting more manufactured goods than agricultured products. It was so in May and June, and nearly true for July. That does not mean that it will hold true for the year, but we are approaching the time when wheat and cotton and corn will not be the larger part of our exports. Cotton may increase, but wheat is not likely to. As the West fills with population the great spaces will require a more varied production, and food will be kept at home. Big reaches of wheat require new cheap land and foreign markets.



The Government appropriated $5,000,000 for the St. Louis Exposition on an iron clad engagement that it should not be opened on Sunday. Now it is reported from that city that the concessionaires of the "Pike" have found a loophole by which to evade the promise. We can hardly presume that those in charge of the Exposition will allow the Pike opened. The appropriation was large, the condition plain and fully accepted. To evade it now would be unpardonable.

The Chinese Minister at Washington says that in Mexico, to which country he is also accredited, many Chinese have cut off their queues, discarded Oriental habits and dress, and are intermarrying with Mexicans. They become Mexican citizens, and are fast becoming important factors in the development of the country. It is the United States that shuts them out and forbids them to be our citizens. Which country is the more civilized?

This is the time to call attention to the Civil Service law as to contributions for political purposes. It is a law of the United States that none of its officers shall take any part in making assessments on employees, and no employee shall be dismissed or reduced in salary for declining to contribute for political purposes, and a number of our States, like New York, have a similar strict law. This law ought to be known and observed.

The episcopal residence in Omaha has hitherto been always exempted from taxation, but Archbishop Quigley thinks that as a private residence it ought to be taxed, and he has voluntarily offered to pay taxes upon it. That is honorable and just. We confess that we see no sound reason why all property, lay or ecclesiastical, residences or churches, not owned by the State should not pay for the protection they enjoy.

Just as people were asking how it would seem, should Mr. Parker be elected, to have Secretary Hay succeeded by David B. Hill, the latter comes out with the verbal announcement that he will take no office under the new administration, and will retire from politics with the new year. Is it final? Politicians die hard.

Fire Testing Station of Columbia University, Showing Building in Which the Test of Metal Lath Partitions Was Made

Fire Test of Trussed Metal Lath Partitions at Columbia University

A VERY interesting fire test of trussed metal lath partitions was made on Wednesday of last week at the Fire Testing Station of Columbia University. The test was conducted under the personal direction of Professor Ira H. Woolson, of the Department of Mechanical Engineering. Representatives of the New York Building Department were present, as were also the president and secretary of the company manufacturing the truss metal lath, and a member of THE INDEPENDENT'S staff. The purpose of the test was to obtain data as to the fire resisting qualities of trussed metal lath partitions. A small building about 15 x 10 x 10 had been constructed at the Columbia Fire Testing Station, on one sidewall of which Kings-Windsor cement plaster had been used on metal lath without iron uprights, and on the opposite sidewall lime mortar gaged with Portland cement constituted the partition. Oak and pitch pine logs with old seasoned boards were used as firing materials, to which the torch was applied at 11 A.M. The temperature was forced up to 1,700 degrees F., and the fire was maintained for one hour. Only small exterior cracks developed. The hose was then played upon the interior sidewalls under the test, and, beyond some scaling of surface plaster, they remained intact. The test was an exceedingly severe one, having been made for the purpose of determining the availability of metal lath partitions in New York City building. These partitions have been very favorably received in the new Baltimore that has come into being since the fire.

Financial

Financial Items

A COMBINATION has been formed, for restricting and selling the output, by the leading producers of slate in Vermont and Northern New York.

....The value of the stoves made in this country in 1903 was $54,000,000, and the number of men employed in making them exceeded 30,000.

....Attention is directed to the announcement of Harvey Fisk & Sons, representing New York Central and Hudson River Railroad bonds, in another column.

....Our exports of agricultural implements have grown from $5,240,000 in 1897 to $16,286,000 in 1902, $21,000,000 in 1903 and $25,000,000 in the fiscal year ending with last June.

....The capitalization, last year, of surface and elevated street railways in the United States was $1,700,726,000 in stock, and $1,401,664,000 in bonds, and they used 29,912 miles of track.

....In the first half of the present year 1,937 miles of new railway track were laid in the United States, against 2,221 miles in the corresponding months of 1903.

....Experiments made by the General Electric Company with a new alternating-current motor for trolley cars lead some persons to predict that this device will greatly hasten the substitution of electric force for steam on trunk lines.

....The nine independent companies manufacturing plate glass have formed a combination. The remainder of the industry is controlled by the combination known as the Pittsburg Plate Glass Company.

....According to the report of the Geological Survey, issued last week, the output of iron ore in the United States in 1903 was 35,019,308 long tons, or about 500,000 tons less than in the "record" year of 1902. This exceeds the combined outputs of Germany and the British Empire. The value at the mines was $66,328,000. In the Lake Superior district 30,573,000 tons were mined.

....The New York Central Railroad Company has placed an order for 30 electric locomotives, each weighing 85 tons and capable of drawing a train of 500 tons at the rate of 60 miles an hour. These will be used in drawing express trains through the tunnel near the station in New York. Electric motors will be substituted for steam throughout the suburban system after the establishment of the necessary power stations.

....Commenting upon the blunders of our exporters, Consul-General Snyder, in Colombia, reports that our exports of furniture to that country are so badly packed that the goods frequently arrive in broken fragments, and that European exporters of cereals and biscuits control the trade because they pack in tins, while similar American goods in paper and cardboard boxes arrive in such a condition that they cannot be used.

....Railroad net earnings for May, according to a statement published recently, were less by nearly $3,000,000 than those of May, 1903; and the decrease since the beginning of the year was $21,000,000. The Baltimore & Ohio's statement for the fiscal year ending with June shows an increase of $1,600,000 in gross earnings, but a decrease of nearly $2,500,000 in net, owing to an increase of $4,000,000 in expenses of operation.

....In a recent public address at Chicago Vice-President William C. Brown, of the New York Central Railroad Company, referring to railway combinations, said: "It is not impossible that the language of the majority of the Supreme Court in recently deciding an important case may, in the light of the years to come, seem to reflect the clamor of the public rather than the calm, judicial review of a great question by this exalted tribunal."

....Dividends announced:

U. S Leather Co., Preferred, $1.50 per share, payable October 1st.

Père Marquette R. R. Co., Preferred, 2 per cent., payable August 25th.

Internat'l Paper Co., Preferred, 1½ per cent., payable October 1st.

Iowa Cent. R'way Co., First and Refunding Mort. Coupons, payable September 1st.

Minneapolis & St. Louis R. R., First and Refunding Mort. Coupons, payable September 1st.

Vol. LVII NEW YORK, THURSDAY, SEPTEMBER 8, 1904 No. 2910

Survey of the World

Political News

William J. Bryan made his first speech of the campaign in favor of Parker at Springfield, Mo., September 1st, in which, without recanting in any way opinions which he expressed at St. Louis in opposition to Judge Parker's nomination, he gave his reasons for supporting the Democratic ticket. The following extracts from the address show his position:

"It is unnecessary to say that the Presidential nominee of the party was not my choice for that place; my objection to him was not to his character or to his personality, but to the fact that he did not stand with us upon the economic questions which have been a matter of controversy in recent years.

"I believe to-day in the principles set forth at Chicago and at Kansas City. I have lost none of my faith in the triumph of those principles. When the election is over I shall continue to fight for those principles.

"I believe in the triumph of every righteous principle, and I have such faith in the righteousness of our cause that I am not afraid that any policy in which we have confidence can be defeated by the election of a Democratic President, even though he may not agree with us on all questions.

"If he will help us remove the issues which now distract attention and prevent a consideration of economic questions, we can await the time when the people can again give their attention to the industrial situation. You can hasten the coming of this time by your support of the Democratic ticket."

Chairman Taggart, of the Democratic National Committee, has secured the active co-operation of a number of Bryan supporters to work in favor of Judge Parker. Ex-Senator James K. Jones, of Arkansas; Charles A. Walsh, who was for eight years secretary of the National Committee, and J. G. Johnson, of Kansas, who was chairman of the Executive Committee in the last campaign, have been added to his personal staff.—It is announced that Judge Parker will not go to the Louisiana Purchase Exposition at St. Louis, and probably will not leave Rosemount during the campaign.—Thomas E. Watson is making an energetic canvass against "the two Republican parties." In reply to the Democratic leaders who are raising the race issue he asks if there is any reason to believe that Judge Parker differs from President Roosevelt in his attitude toward the negro. Both parties, in his opinion, ignore the most important questions of the day, and there is little choice between them. At Kansas City, speaking on Labor Day, he said:

"What is the labor question? In plain English, it is the workman in every field of industry, no matter what that may be. The workman, whose toil produces the vast annual increase in the nation's wealth, asks why it is that the men who produce the most of this wealth should enjoy the least of it, while the men whose toil produces the least of it should, by subtle contrivances of law and of business, enjoy the most of it. In other words, the man who makes it all thinks that he ought to have a fair share of that which he makes. They tell us that the condition of labor is now vastly improved. That is true. Many a workman now enjoys in his cottage conveniences of life which a king could not command some hundreds of years ago. It would be a strange thing, indeed, if civilization could entirely separate itself from those upon whose shoulders it is supported, but the man who can deny that the working people of this country are now suffering from unjust conditions is a very bold man."

—In Arkansas Governor Jefferson Davis was re-elected by nearly the usual Democratic majority, notwithstanding vigor-

ous efforts made by the Republicans to reduce it.—The Democratic Convention at Oshkosh, Wis., nominated ex-Governor George W. Peck for Governor by acclamation. The platform demands a return of the Federal Government to its constitutional rights and province and denounces the system of primary elections, which is to be voted upon in November.—Senator Charles W. Fairbanks, in his progress from Marion, Kan., to Brunswick, Maine, made many speeches from the car platform, as well as in halls. At Kansas City, in the hall where the Democratic convention was held in 1900, about 17,000 people were present. In these addresses he devoted most of his attention to economic questions and spoke as follows in regard to trusts:

"Our Democratic friends inveigh against the trusts, yet they have done nothing to restrain them. The Republican party has enacted laws for the regulation of combinations in restraint of trade or commerce between the States, and it has not allowed them to encumber the statute books as a dead letter.

"While the Republican party believes in restraining capital which is organized to restrict just competition, it firmly believes in safeguarding that which is engaged in wholesome trade and commerce. Our modern development requires the use of larger capital than was necessary a few years ago. The use of such capital is not a menace. It has a vital function to perform in our material development. It is only the misuse of it that we seek to guard against. The Democratic party has put upon the Federal statute books no act to regulate combinations which concern the public welfare, nor has it enforced those written there by the Republican party. All that has been done with respect to trust regulation has been done by the Republican party. The Sherman anti-trust law was the fruit of Republican statesmanship."

Labor Events

Labor Day seems to be losing its special significance as an ocular demonstration of the power of organized labor, and is passing into the position of a common holiday, which most people take advantage of to get out into the country. In New York there were only 13,000 men in the parade, which was under the management of the Central Federated Union. Last year there were 25,000, and the procession was led by Sam Parks, then temporarily released from Sing Sing, where he had been sent for extortion. It was proposed to give the place of honor this year to Weinseimer, the leader of the Building Trades Alliance, who is under indictment for the same offense, but he resigned his position, and the Alliance did not take any part in the procession. The Housesmiths' Union, numbering 2,500, and the Amalgamated Butchers and Meat Cutters, 700 strong, made the best showing. In Chicago there were only 30,000 men in line, the smallest number in years, and less than one-third the number who marched last year. It was under the control of the Associated Building Trades Council instead of the Chicago Federation of Labor as in former years. At Paterson, N. J., there were no brass bands in the parade, owing to the refusal of the American Federation of Musicians to march with the fife and drum corps, the members of which, altho they have a union, receive less pay than the Federation requires.—Altho no agreement is yet announced and all the unions have not yet voted to abandon their position, there is much to indicate that the strike of the packing house employees is practically at an end. In New York a considerable proportion of the men are again at work and the local unions have voted not to continue the sympathetic strike. In Chicago conferences are being held between the representatives of the unions and of the employers, and it is reported that the men will soon return to work under "open shop" conditions. The wages of skilled men will remain as before; the packers are to employ as many of their former employees as possible and give them the preference. President Donnelly, of the Butchers' National Organization, threatened a meat famine by declaring a boycott on all meat and calling out all men throughout the country concerned in handling it. The strike has now lasted about two months, during which time the Chicago police report 46 assaults, 4 murders, 97 accidents and 43 removals to hospitals. On Sunday four switches were torn out and a meat train was wrecked and robbed of its contents, several thousand pounds of dressed

beef.—A general strike is still threatened on the elevated roads in New York, on which several hundred thousand people are dependent for transportation to their daily labors. August Belmont, the president of the Interborough Rapid Transit Company, persists in his refusal to grant the motormen in the new subway $3.50 for a nine-hour day, but he is willing to give concessions on minor points, such as preference to experienced motormen from the elevated road who wish to go into the subway. Grand Chief Warren S. Stone, of the Brotherhood of Locomotive Engineers, states that running subway trains of 300 tons, carrying 500 to 800 lives, at a speed of forty-five or fifty miles an hour, requires the best men procurable, who deserve higher wages than the $3.00 offered by the company, and that it is not in the interests of the public that the men be made to work ten hours. The Interborough officials declare that they will be able to open the subway immediately in case of a strike of the elevated men and run regular trains. Jim Farley, the professional strike breaker of Chicago, has been called to New York, and is reported to have a thousand or more men ready to fill the places of the strikers at a moment's notice.—At Cripple Creek Sheriff Bell approached the house of the Methodist minister, Rev. T. S. Leland, at night and was fired upon by Arthur Parker and L. H. Jenks, who were guarding the house and did not recognize him. Both men and the pastor were arrested for assault and conspiracy to murder, but the latter has been released on bail.

South American Affairs

It is expected that the claims of the allied Powers, Great Britain, Germany and Italy, against Venezuela will be settled in full in two years instead of taking ten years, as was thought when the arrangement was made. If the revenue receipts at the custom houses of La Guayra and Puerto Cabello keep up to their present figure the claims of the other Powers who did not make an armed demonstration will be paid about four and a half years later. According to the report of Minister Bowen the three allied Powers had received up to June 30th 6,880,450 bolivars, and they are still to receive 10,398,688 bolivars, after which the other Powers will receive 21,149,441 bolivars. (The bolivar is valued at about 19½ cents.)—The Panama Government is manifesting a more friendly disposition toward the Canal Commissioners, and it is believed that there will be no difficulty in arranging the differences which have arisen in regard to custom house and post offices. At a dinner given by the American Minister at Panama, Mr. John Barrett, in honor of Señor Arias, Minister of Foreign Affairs, the latter toasted President Roosevelt in appreciative words, and expressed a hope for his re-election. Mr. Barrett has recently visited Bocas del Toro and the Chiriqui Lagoon, which he reports is the best harbor on the southern limit of the Caribbean Sea, well suited for a naval station. President Amador and Secretary of State Morales have received a satisfactory report from the Government Commissioners that they have invested more than two-thirds of the Panama funds in good securities in New York.—A collision occurred on August 20th between the Peruvian and Ecuadorian troops on the frontier of Ecuador, in which the Peruvians were victorious, capturing the Ecuadorian leader. It is not thought that the affairs will lead to any serious rupture.—In Uruguay the Minister of War in command of the Government troops reports that he has gained a decisive victory over the insurgents under General Saravia, the gaucho leader, who was wounded in the engagement. The Minister of Government, Dr. Williman, in a speech before the Chamber at Montevideo the last of July stated that the Government earnestly desired peace. But at the same time there was no relaxation of the prohibition of the publication of the terms of peace which had been arranged by the committee of prominent citizens.

The International Socialist Congress

The most important topic of discussion at the International Congress of Socialists held at Amsterdam was the old question of tactics, which was hotly debated for three days,

and then by a vote of 27 to 3, with 10 declining to vote, the Dresden resolutions were readopted, condemning all affiliation with other parties, however radical, and refusing to accept any office in the Govenment. M. Jaurès, the French socialistic leader and editor of *Humanité,* who held the office of a vice-president of the Chamber of Deputies in the Combes Government, made an eloquent plea in favor of co-operation with any party which was carrying into effect their principles. He compared the practical results attained in France through the aid of the Socialists in the secularization of the schools and the adoption of legislation favorable to the laboring classes with the impotence of the numerous Social Democratics of Germany which wished by this resolution to bind the Socialists of other and freer nations to the same barren and narrow doctrinaire policy. In a republic like France the tactics must be very different, for there the people had all the power in their own hands and must be trained to use it. In reply Herr Bebel claimed that in spite of its monarchical form the people in Germany had many advantages over those in France, and that the *bourgeoisie* of a republic was a more dangerous enemy to Socialism than the court party. M. Jules Guesde, representing the irreconcilable faction of French Socialists, supported Herr Bebel, while M. Vandervelde and the Belgian Socialists favored a modification of the rule, allowing greater freedom of action in their own country as well as in France. A spectacular feature of the Congress was the presence on the platform on either hand of the chairman of Katayama, a delegate from Japan, and Plekhanof, a representative of the Russian proletariat. Both these expressed their hatred of the war between the Japanese and Russian Governments, and were wildly applauded as they shook hands as a symbol of the unity of the Socialists of all nations.

The Crisis in the Scandinavian Churches

The Scandinavian Church up to comparatively recent times presented a solid conservative front to the advanced theological thought. In recent years all this has changed, and largely through the influence of Harnack's work on the "Essence of Christianity," which was translated into Norwegian by the well-known orthodox pastor, J. Jansen, and favorably reviewed by no less an authority than the present bishop of Christiania, the former professor, Dr. A. Bong. Modern theology has made phenomenal strides in Norway. The pioneer of the movement is Pastor Klaveness, whose address in the Lutheran Conference in Lund some time ago, in which he ascribed the indifference shown to the Church by the educated classes to the fact that the Church closes its eyes and ears to progressive thought, really started the ball a rolling. Since then Klaveness has demanded that the results of criticism, such as the mythical character of the story of the Old Testament of the Patriarchs, be taught as such in the schools; and in his journal, "For Kirke og Kultur" (*For Church and Culture*), which he publishes in connection with Pastor Brunn, has made active propaganda for the new views. A series of sermons, entitled "The Gospel Preached for Our Age," brings the new views on the pulpit and is a model of modern homiletical production. Pastor Trandberg, at a great church congress in Christiania, discussed the question, "Is our Church threatened with a new revolution in the twentieth century?" and gave the answer Yes. The most pronounced opponent of the new movement was the venerable Bishop Hevet, who in a special brochure mentioned by name the theologians whom he regarded as heretical, among them leading university professors. At present the Norwegian Church is sharply divided into two camps, the conservative and the advanced. The same is true of Denmark, where the radicals are fighting fire with fire. In Copenhagen, in order to counteract the influence of the flourishing Sunday-school work of the conservatives, the radical "Studentensamfund" has inaugurated an opposition propaganda by holding Sunday-schools in which the biblical history is supplanted by stories, fables, natural history, and the like. The movement has also found its way into Sweden, where the student association "Den Yngre Gubben," in Lund has organized anti-churchly Sunday-schools after the Copenhagen model. Begun in

April of the present year, the attendance is already very large, a woman student of medicine being one of the leaders. In all three Scandinavian Churches the agitation is the leading subject of public thought.

The Temporal Power of the Pope

There are many things recently to indicate that Pius X is inclined to modify the irreconcilable attitude assumed by Pius IX toward the Italian Kingdom, and it is not impossible that a *modus vivendi* may soon be reached by which the Pope may accept satisfactory guaranties of his freedom and independence without insisting on the extreme claim that territorial sovereignty is necessary to the discharge of his duties as head of a worldwide church. A writer in the *Osservatore Romano,* the recognized organ of the Vatican, gives a history of the temporal power in which he shows that it grew up naturally and legitimately when the corrupt and heretical government at Constantinople plundered and abandoned Rome and Italy. At such a crisis the Pope was forced to assume the duties and responsibilities of an earthly potentate for the protection of both Church and people. Such a position must be maintained so long as it is necessary for the interests of the Church, but a civil principality is not to be regarded as essential to the Papacy, and whenever it can be shown that the independence of the Church can be safeguarded in some other way the Pope will be found willing to sacrifice his personal interests and give his rights as a prince. The Paris *Figaro* quotes Cardinal Merry del Val as saying in regard to the temporal power:

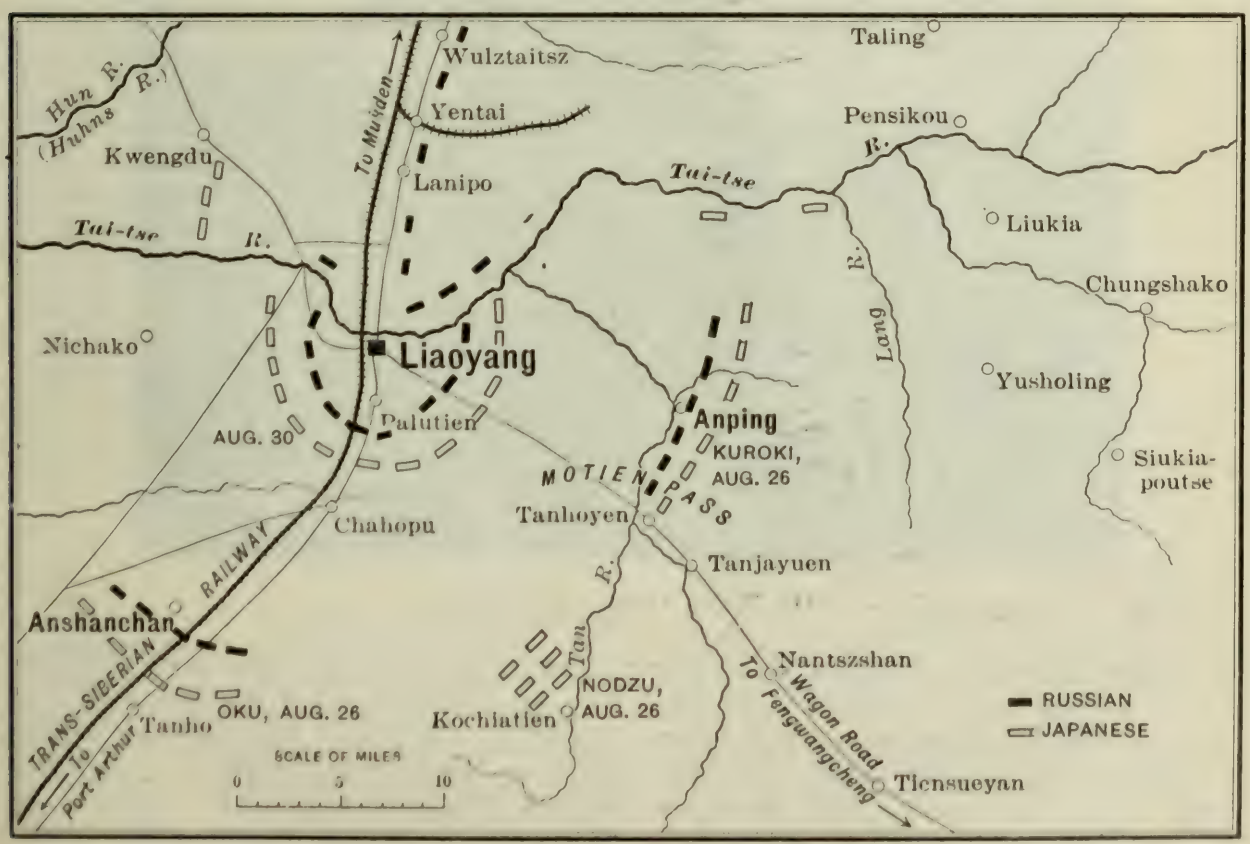
"By the way, let me tell you that we do not like that term. The general public should clearly understand that the Holy See demands only that material independence which is indispensable to the maintenance of its moral independence. It needs certain facilities for its intercourse with the 400 million Catholics scattered over the earth. The term 'temporal power' does not express that independence and those facilities. Temporal power implies administration in general, comprising that of justice, finances, police and numerous things which may be dispensed with by the Holy See. But it cannot dispense with its material independence. That is a fact which must be made known."

Irrigation in Egypt

The British Government in Egypt has tentatively adopted the plans proposed by Sir William Garstin, Under-Secretary of State for Public Works in Egypt, for a system of irrigation works on a larger and more systematic plan than any hitherto attempted. The ultimate necessary expenditure is estimated at $107,000,000, of which $65,000,000 will be used in the Soudan. Altogether, 2,650,000 acres will be brought under cultivation when the works are completed. The Assuan Dam, opened only two years ago and considered a very daring project, has proved so successful that it will be raised at a cost of $2,500,000 more. The two Nile mouths at Rosetta and Damietta are to be improved and remodeled at a cost of $4,500,000, and $15,000,000 spent on the Egyptian railroads. The report closes with this peroration:

"Those to whom the privilege shall be granted of assisting toward this consummation will have a chance given to them such as seldom falls to the lot of man. To rescue the Upper Nile from the marshes in which it has lost more than half its volume; to control and regulate the great Equatorial lakes, making them add to the flow of the river at will; to cause the waters of the Blue Nile to rise and irrigate the fertile tracts through which they pass; to secure to Egypt a constant and sufficient supply for the entire area between the cataracts and the Mediterranean; to free that country from the ever-present danger of a disastrous flood—these are tasks worthy of comparison with any previously recorded in the world's history, and which, if successfully accomplished, will leave behind them a monument that will probably endure long after all evidence of those erected by an earlier civilization shall have passed away."

The Battle of Liao-Yang



If we consider only the number of troops engaged, the battle of Liao-Yang is the greatest that has ever been fought in the history of the world, for in the two armies there were between 400,000 and 500,000 men. The combined strength of the three Japanese armies is estimated at 240,000 men and 1,000 guns, and the Russian force was over 200,000, with about the same number of guns. Altho the Russians were probably somewhat outnumbered, the fact that they occupied a strong position of their own selection, fortified by

Field Marshal Marquis Oyama, Commander-in-Chief of the Japanese Armies, and the Marchioness Oyama, a Vassar Graduate
From Stereograph, Copyright, 1904, by B. L. Singley

months of labor and as nearly impregnable as military engineering could make it, more than compensated for any odds in numbers. Liao-Yang, which General Kuropatkin had made his headquarters during the campaign, and in which he had gathered the military stores for the armies in Manchuria, is surrounded by an ancient wall of stone, measuring two and a half miles north and south and two miles east and west. In the middle of each of the four sides there is a gate; the north gate leading to the Taitse River, the east gate to the road through Anping to the Yalu River and Korea, the south gate to the road to Niuchwang and Port Arthur and the west to the railroad station. The most conspicuous building is the tower of the Buddhist Temple to Kwan-Yin, the Goddess of Mercy. The main movements of the battle, which seem to have been executed with the precision of a chess problem, can be readily followed by reference to the map. The three Japanese armies, landing at such distant points, were here brought to a focus and concentrated at Liao-Yang, fifty miles south of Mukden and 220 miles north of Port Arthur, according to the plans of Field Marshal Oyama, who recently took command in person. The first Japanese army, under General Kuroki, which had effected the conquest of Korea, approached from the east and met the enemy at Anping. The second Japanese army, under General Oku, which had cleared the Russians out of the Liao-Tung peninsula and advanced northward up the railroad from Port Arthur, attacked from the south the Russian position at An-Shan-Chan, the most northern point

reached by the Japanese troops in the war against China ten years ago. The third Japanese army, under General Nodzu, which landed at Takushan, approached from the southeast, so fitting in between the two. Besides this a detachment of 30,000 Japanese was reported to have gone up the western bank of the Liao River and to have crossed the Taitse, but probably these troops were not near enough to take any part in the battle, since nothing has been said of them. General Kuroki attacked the Russians' entrenched position near Anping on August 24-26th with his left and center; his right being reserved for another movement not at that time understood by the enemy. With the assistance of General Nodzu, who attacked the Russian flank, they were forced to retire from Anping to Liao-Yang, followed closely in their westward march by detachments from Generals Kuroki's and Nodzu's divisions. As they approached the railroad, of course, the Russians opposing General Oku at An-Shan-Chan were obliged to fall back north along the railroad to avoid being cut off. The Russians then took a strongly entrenched position on the hills in a semicircle around Liao-Yang, and about six miles away, with both wings resting on the Taitse River. The Japanese formed an outer circle about two miles distant, and from August 30th to September 3rd the battle continued; the shells from the Japanese guns reached all parts of the city, and the Japanese made repeated charges with the bayonet. On the last day of August Kuroki's right wing effected a crossing by means of a pontoon bridge over the Taitse River, now swollen from the heavy rains, at Sakankan, 20 miles east of Laio-Yang, and marched north toward the Yentai coal mines, at the end of the branch railroad, with the intention of surrounding the Russian army. As soon as he perceived this, General Kuropatkin began to withdraw his army across the river and succeeded in extricating his army and in retreating beyond the Yentai branch on the road toward Mukden. The First Siberian Corps of 25,000, under General Stakelberg, came very near being cut off, ow-

The Battlefield of Liao-Yang, Showing the Situation on August 26th, when the Three Divisions of the Japanese Army Began the Attack, and on August 26th, when they Closed Around Liao-Yang and Forced the Russians to Retreat Across the River.

ing, as General Kuropatkin reported, to a disobedience of orders, but by making a detour of several miles to the west the bulk of this division escaped capture. The valley between Liao-Yang and Mukden is the most fertile part of Manchuria, and covered with crops of Chinese millet. The Japanese ambushed in the tall grass and grain and effected great slaughter of the retreating Russians. Major-General Orloff's detachment was nearly annihilated in this way; one regiment losing 1,500 men, half its number, but General Stakelberg's corps escaping from Liao-Yang arrived in time to save the remnant. Most of the immense stores of military supplies accumulated by the Russians in Liao-Yang were burned to prevent their falling into the hands of the enemy. The city was entered by the Japanese on Sunday, September 4th. No accurate reports have been made as to the loss of life, but it is thought that it cannot be less than 50,000 altogether. The Japanese soldiers were said to be almost starving and nearly exhausted by their ten days' continuous fighting and rapid marching, but they kept up a running fight on the rear and flanks of the three Russian columns in their retreat to Mukden. It is now reported that Mukden is being evacuated and the Russian headquarters moved to Harbin for the winter.

The White Tower, Liao-Yang

Recently Proposed Chemical Elements

BY PROF. CHAS. BASKERVILLE, PH.D.

[Professor Baskerville holds the chair of chemistry in the College of the City of New York, having been recently called to it from the University of North Carolina. He has of late come into public notice by his discovery of the chemical elements carolinium and berzelium, the first elements discovered by an American. They are the fruit of work carried on for some years on the properties of thorium, the element to which is due the brilliancy of the "Welsbach mantles."—EDITOR.]

THE chemical elements, according to present acceptation, are those substances known in nature which have as yet not been subdivided into anything other than themselves. They may, under suitable conditions, be so altered as to appear to be something else, as, for example, oxygen is easily converted into ozone, but ozone is readily changed back into oxygen. It simply is another form of the same substance.

The elements possess certain characteristic physical properties; for instance. the same volume of oxygen weighs sixteen times as much (approximately) as a like volume of hydrogen under similar conditions. This equivalence is known as the atomic weight or mass—that is, hydrogen is one and oxygen is sixteen.

Under restrictions the elements combine through the agency of a natural force termed chemical affinity. In such unions the elements always enter in the amounts of their equivalence or multiples of the same; never as fractions of the atomic mass, although such may in itself contain a fraction. Chlorine is 35.45 times as heavy as hydrogen.

Great civic, literary and scientific movements approximate climacteric periods. The decade marking the closing of the nineteenth, including our experience of the twentieth, century is

> "The cycle of a change sublime
> Still sweeping through."

In that time Rayleigh and Ramsay discovered argon in the atmosphere. This element and its fellows—helium, neon, krypton, and xenon—soon isolated by Ramsay, so far have defied all efforts at causing them to combine, either among themselves or with any known substance.

In that time Roentgen fell upon that unique form of energy which penetrates wood, metal and flesh. Almost every one has experienced the actuality of these X-rays by means of a fluorescent screen or their action upon a photographic plate. Investigating this latter property, Becquerel learned, quite by accident, that compounds of the element uranium possess the ability of giving off rays which affect a sensitive gelatinized plate through black paper and ionize gases. By this last term, our knowledge of which is due largely to the researches of the illustrious Cambridge professor, J. J. Thomson, we mean that gases become better conductors of electricity when under the influences mentioned than ordinarily.

Using this property as a guide, the brilliant teacher in the Parisian school, Madame Curie, separated from the residues of pitchblende a substance which possessed it to a remarkable degree. She designated the element *polonium*, after her native country. With her husband, a professor in the Sorbonne, she then isolated another element, *radium*, which resembles the heavy alkaline earth metal barium. Radium has been shown to possess a characteristic spectrum and atomic weight—by common consent, the elementary requirements.

Fast crowded researchers into the novel field of activity. Schmidt and Madame Curie, independently, learned that thorium compounds, as usually extracted from their minerals, are radio-active. Debierne separated from pitchblende *actinium*, like thorium, but possessing marked radio-active properties, being many thousand times stronger than thorium.

Here it must be noted that uranium is that element generally regarded as having the highest atomic weight (240), while thorium has stood next to it (232.5). Radium was found to have an

equivalence of 225. It therefore appeared that the size or weight of the atom had much to do with radio-activity, which according to a majority of the European investigators is an atomic property.

The writer has succeeded in extracting from the old thorium two novel applicants for membership in the family of elements, *carolinium* (256) and *berzelium* (212). These, so far, are radio-active, but the materials used were obtained from minerals which were also active. Hofmann and Zerban obtained an inactive thorium from a Norwegian mineral, and the latter, working with the writer, has secured a similar preparation from a South American ore. Rutherford has extracted from the ordinarily active thorium an exceedingly active substance, which is called *thorium-X*. This loses its activity very rapidly, perhaps due to the giving off of a gas, "emanation," according to Rutherford and his colleague, Soddy. The latter carried the problem to Ramsay's laboratory, where by means of the superb facilities for handling and examining gases they obtained the spectrum of helium and something new, which has been designated *ex-thorio*. A similar gas, *ex-radio*, has been obtained by Ramsay from radium compounds.

Hofmann at Munich has also separated a *radio-lead* (260), Marckwald in Berlin a *radio-tellurium*, and Giesel has secured something new between the elements lanthanum and cerium, which he terms *emanium*.

Characteristic spectral data are wanting for all of these proposed radio-active elements except radium and ex-radio. An atomic weight has not so far been obtained for the latter.

The venerable Clemens Winkler advises caution concerning their acceptance before they are more thoroughly investigated chemically. The wonderful new field of energetics opened up by Becquerel's discovery has admittedly and conveniently inclined scientific men toward a study of the physics side of the problem, to the dwarfing of the chemical phases of the subject.

Attention must be directed to a most interesting point in the investigations of the radio-active bodies. Coppel has determined, by means of the spark spectrum, that one may detect one part in 100,000,000 of the well-known element strontium. Pure radium bromide has an activity of 1,500,000, metallic uranium being the relative standard. The principal line of radium in the ultraviolet portion of the spectrum may be seen faintly in a preparation forty times as active as uranium. With the most sensitive electrometer, whose use is dependent upon the ionization of air, 1-10000 of the activity of uranium may be observed. Radio-activity is thus a detectable property, using round figures, nearly a million times more sensitive than spectrum analysis, which is at least a thousand times more delicate than the most sensitive balances.

Radio-bodies by juxtaposition are able to induce activity in absolutely inert substances. The vessels, apparatus, even the clothing of the operator in the room, assume the property. It is not a strain upon the imagination, therefore, to conclude what happens after separation when radio and non-radio-active chemical elements are bound together in one compound. To be sure these various radio-active substances are more or less diverse in the quality of their activity. Carolinium and berzelium, in fact, have little to do with radio-activity.

With the exception of the fine "noble" gases of the air and radium, all stand before the bar of judgment, each offering perhaps valid reasons for its acceptance. Chemists are most properly conservative and require confirmation at the hands of many. Each applicant must stand a most searching examination and not be found wanting before installation among the elect.

New York City.

The Liberties of Japan

BY J. H. DEFOREST, D.D.

Special Correspondent of The Independent in Japan

WHAT should be said on this subject would take a book rather than a magazine article. I am writing in the beautiful Aizu Valley, the home of one of the most powerful military clans of Japan, whose warriors were the equals of the Satsuma, Choshu and Tosa fighters. Somehow or other there is mingled with the intense loyalty of the old Samurai a love of liberty that no despotic methods could ever eradicate. And this spirit of liberty has pervaded all classes, so that the daring deeds of self-sacrifice on the part of even the farmers are not surpassed in the history of any people.

While spending a night at one of the restful health giving hot springs of this valley I sat on the mats for hours with two men, both of whom in 1880 were arbitrarily arrested and kept in prison about eight months. It was a delight to hear direct from their lips what I had long known—the account of those despotic days. I had just lectured at the public school, before a crowded house, stating that the United States sympathized with Japan because she has adopted those priceless liberties of government and religion for which our ancestors fought, while belated Russia is still a despotism, under which political suspects are arrested and punished arbitrarily and sometimes brutally, and where religious offenders feel the tyranny of a state religion that keeps the people in ignorance and superstition.

"Twenty years ago we were just like Russia," said Rev. S. Kaneko, who was arbitrarily arrested in 1881.

My two friends were enjoying their freedom of to-day as they reviewed the situation. "Twenty years ago we were just like Russia," they said. In this they were mistaken, for at that time Japan was really moving rapidly toward free institutions, to which her Emperor had pledged himself at the time of the Restoration. In the swift transition from the despotism of the Shogunate and from the hermit stage to civil liberty and wide international relations the only marvel is not that there were arbitrary acts by those in power, but that there were not many more of them.

The story these two men told is the story of the one test case that settled in Japan once for all the question of civil liberty. I doubt whether it has ever been told in the West, and at this time, when there are some who question the reality of Japan's new civilization, it is well to note something of the spirit that is behind her contest with Russia.

Now it had already become a law that the taxes and expenditures of each province should be voted by representatives duly elected and convened by the Governor. But the Governor of this Aizu Valley and the surrounding region in building extensive roads needed far more money than the representatives would vote him. He therefore tried to secure contributions from rich men for this purpose. He called some to his office, he sent policemen to browbeat others into contributions, and he even had some brought to the police stations and kept there for two days without food to force their subscriptions. Meanwhile his vigorous road building went on far in advance of the taxes that were voted, and when the representatives tried

to meet for consultation he had them surrounded by police, who violently broke up their meeting and brutally beat some of them.

About two years before that, 1881, the Jiyuto (Liberty party) had organized their party. It was a vast advance on anything Japan had ever known that the term Liberty, which is wholly absent from the literature and thought of China and Japan, should be coined and put to a great political purpose. No wonder that it made some of the would-be despots a little anxious. Anyway, this Governor who built roads saw that the only road to his success was first to break down this new party of liberty. His method was to send his secret emissaries to join the party, urge extreme measures, even the overthrow of the Government, and thus egg on the members until they could be accused of treason.

But these liberty-lovers were also men of law and would do nothing lawless until every possible right measure were tried. Forced to meet in secret they elected six of their number to prosecute the Governor in the Court of Appeals in Sendai. The case seemed almost hopeless, for the central government was secretly upholding the lawless Governor, advising him to arrest these men as disturbers of the peace. But as they had only disturbed his peace and not that of the community, there was no crime. Yet a large number of these prominent men were arrested without process of law and taken to the police station in the hope of breaking their spirit of opposition to lawless methods. But they stood firm, demanding to know why they had been arrested illegally, insisting on their rights even as prisoners. As the Governor denied them any reply, after a few days the enraged people really made a violent demonstration in behalf of the prisoners, at which the police brought two charges against those whom they had already arrested—namely, opposing the Government and inciting the people to revolt.

The case was tried in Sendai, where a young lawyer, a member of the Liberals, drew up a powerful statement of the illegal acts of the Governor and presented it to the court. This fearless arraignment of a high official appointed by the Emperor cost the young lawyer eight months' imprisonment at hard labor, but his outspoken accusations of the Governor were copied in the papers all over the country, and his unjust sentence everywhere won him profound sympathy. Even some high officials openly said his sentence was sheer injustice. Within a week after his imprisonment the Governor of the Sendai region had the young lawyer, Fujisawa, detailed in prison as the moral teacher of the young prisoners and with no more hard labor! Right opposite Fujisawa's house lived another young lawyer, whose soul boiled over with indignation at the despotic manner in which the lovers of liberty were being hunted down. He concealed some and aided others to escape, and for this he, too, was cast into prison. Meanwhile the above mentioned six were quickly convicted and sentenced to a shamefully long imprisonment of fifteen years. They appealed to the Supreme Court and their friends loyally backed them. The afterward famous Hoshi Toru, who became Minister to the United States, then President of the Diet, then was expelled from the House of Representatives, and at last was assassinated, was their lawyer. He won his case, and all these men were released and welcomed back amid the public and joyful demonstrations of the people. The despotic Governor and the despotic Government had to climb down, and the great event was heralded all through the land that the central Government had been defeated before the Supreme Court.

There have been several Governors since who, relying on their Imperial appointment, have attempted high-handed methods, but whenever they have done so the people have successfully held them up, have sometimes had them fined and sometimes removed. So that of late years the forty-five Governors have made no attempts to trifle with the liberties of their subjects. And it is instructive to notice that the young lawyer who first defended the six has been elected to every Diet since, as have a large number of those who were imprisoned for their advocacy of liberty. Kataoka Kenkichi, who was chosen four times

Honorable Mr. Muramatsu, Member of the Present "Diet." Imprisoned in 1882 for Protecting Members of the New Liberal Party Who Were Avoiding Illegal Arrest

Governor Matsudaira, Who Had Lawyer Fujisawa Detailed to Be a Moral Instructor in Prison

Count Itagaki, One of the Petitioners in 1880 for the Establishment of the "Diet," and the Leading Man in the Organization of the Liberal Party

Every Lover of Japan Knows of Count Okuma, Who Received His Knowledge of Political Liberty from American Missionaries and Who is To-day the Leader of the Progressives

Speaker of the Lower House, was one of those who in the days of the Peace Regulations about twenty years ago was ordered to leave Tokyo and refused to go or to be muzzled by any unjust decree of the Government, and so suffered imprisonment for more than a year. His successor as Speaker in the Diet that met last December was Kono Hironaka, who also was imprisoned for seven long years in those troublous transition days to keep him from his earnest advocacy of the people's rights. A goodly proportion of men in the Diet and in high places have been prison birds. They know liberty when they see it, and are willing to suffer in its defense.

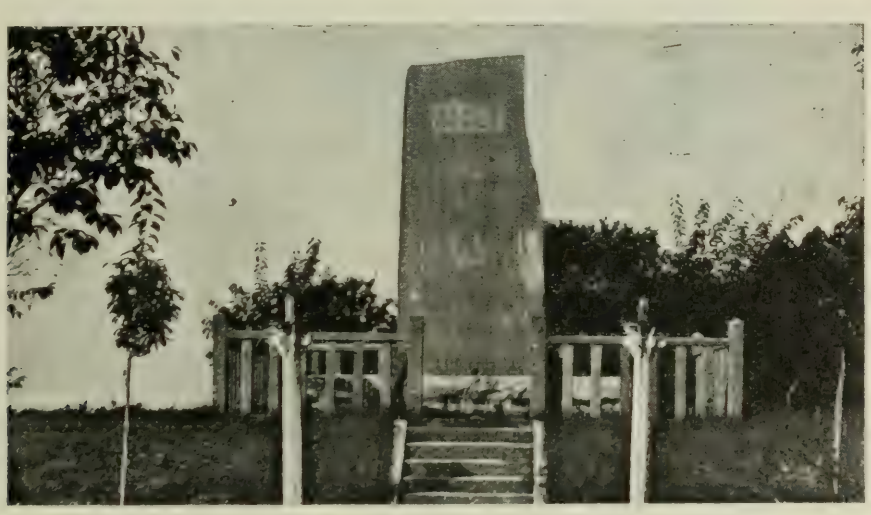
Japan is blessed with this stamp of men in every department of national life. Their distinctive name is *Yushisha,* well-wishers, men who sympathize with righteousness and progress, and are willing to suffer for others. They have self-control, but they cannot be unjustly muzzled. They may be said to have given to the people of Japan "the Three Great Liberties" of speech, of the press, of assembly. Their test case ended in a victory greater than any the army and navy have recently won, for without these liberties the deeds that have astonished the West could never have been done. The soldiers of Japan are free men and they know it.

With reference to liberty of speech, it must be said that it is by no means unknown in the history of this nation. Indeed, so deep is the love of intellectual liberty that many a noble man has given his life rather than keep silence. Out of numerous instances here is one. In an inland town that I often visit is a monument erected to the memory of a man who some fifty years ago ventured to relate a dream, for he knew it would be death to tell his thoughts straight. He dreamed that a barbarous people called English were really not so barbarous, and that it would be well for the future of Japan to get into contact with those people of the West. This dream was essentially hostile to the exclusion policy of the Shogunate, and its author was dogged from one retreat to another till in self-defense he killed his pursuer and then committed *hara-kiri.* Yet the monument of Takano Choei stands in the public park of Mizusawa, and his memory is honored not only by the people, but by the Emperor himself, who six years ago conferred upon the dead patriot a posthumous rank of the fourth order, while his prophetic dream is more than fulfilled in that England is now Japan's powerful friend and ally.

That these civil liberties have a solid history, and that the victories won are permanent are abundantly shown by a recent book of six hundred pages on "The History of Popular Rights in the Far East." Here is an open record of the part fearlessly taken by able men to secure complete recognition of the rights of the people. We read how delegates from all parts of the land met here and there in secret and resolved "to labor for the overthrow of despotism and the establishment of civil liberty; to part with property, nay, even with wife and children, and to face death itself for the accomplishment of this object; and whatever the cost, never to dissolve our band until this purpose be obtained."

Every arrest of these men, every judicial sentence against them, only deepened the popular feeling against despotic methods, and hastened the day of liberty. Men like the truly noble Count Okuma and Count Itagaki, who were a little too high for irregular arrest, freely spoke their minds and encouraged their liberty-loving followers. The whole country was in a ferment even more profound than it is to-day over this frightful war with a huge Western Power.

The history of the United States was one mighty incentive in this wide movement, and every patriotic speech bristled with stirring events from our War of Independence. Patrick Henry never dreamed of appealing to Orientals, but his "Give me liberty or give me death" had as successful a run in Japan as in America. Hale's dying words projected themselves into another century and across the Pacific, and found new expression in the hearts of those patriots who were condemned to be hung for violent methods in behalf of liberty. Every speaker in those days had something of Rousseau's and Montesquieu's sayings at heart, and the works of these



Frenchmen had a wonderful run all through the country. The French Revolution was studied and the liberties thus learned were continuously taught the people. Baron Kato Hiroyuki had been so captivated with the doctrines of liberty that he published a book, the pith of which was:

"Hitherto our scholars have taught us that all subjects of the Emperor must yield unquestioning obedience to his will in everything. But this is bad teaching. To be sure, our Emperor differs from those of Western nations, yet he ought to make the will of his subjects his will. For all men are equal and have heaven-conferred rights."

Here was radical democracy. But later, in his adoption of materialistic evolution, he withdrew these views, yet the idea that all men have heaven-conferred rights gradually became so deeply rooted in the popular mind that when, fifteen years later, a belated member of the Diet uttered the old opinion that subjects have no rights save those conferred by the Emperor, he was interrupted with a sharp contradiction: "We have heaven-conferred rights that can neither be granted nor abridged by the Emperor."

That is where Japan now stands, and in the face of this war with despotic Russia she sees it as never before. Her orators, standing now on solid ground, speak with deep gratitude of the precious liberties our history has aided them to gain. I can hardly glance at the report of any public speech nowadays that does not feelingly refer to this. Her greatest statesmen, her ablest educators, and her press are saying: "The United States inspired us with her history of every kind of liberty. The Anglo-Saxon principles are those we have adopted and for which we are fighting."

There is no space here for the story of how the long battle of eight years over personal liberty ended in victory for open courts and the abolition of trial by torture and the promulgation of civil and criminal codes. Why, Marquis Ito, in his recent speech, that was evidently meant to be read in the West, even spoke of "the freedom of marriage." This means that the spirit of personal liberty has entered the family, and has revolutionized the old parental despotism to a marked degree. And three years ago the cry was raised in part by a missionary and yet more by prominent Japanese that the women who had been sold into the Yoshiwaras should have the liberty of abandoning their lives of shame. In spite of strong police opposition the test cases were won in the courts, and thus one more good step was taken on lines of liberty, and one more glory added to womanhood in Japan.

Monument to the Man Who Dared to Dream About the English

As for religious liberty, Japan has it not only on paper as given in that glorious XXVIII article of the Constitution, but has it in reality as no other nation has it save the United States. The thirteen thousand arrests mainly of Protestants in England over that educational blunder, and France's fight against religious schools, show that the rest of the world has not yet attained to such

religious liberty as have Japan and the United States. I think it one of the greatest proofs of Japan's insight and high political purpose that she took the United States as her model in religious liberty. It showed not only rare wisdom on the part of her statesmen, but what is far more rare in the history of religions, wisdom and breadth of view on the part of the powerful Buddhist priesthood, in that its members did not oppose with violence their own disestablishment to make room for a religion that had seemingly imperilled the very existence of the nation only three hundred years ago. There is no evidence in the history of any nation of such toleration and even catholicity on the part of the Government and religions of the land as Japan's Meiji Era furnishes. Even her great ally would "not really be so barbarous" if she would do as Japan has done.

Therefore, any attempt on a part of the European press to give the impression that the present war is one of Christianity against Buddhism is rabid nonsense. There never was a nation in which the liberty of religious propagandism was more free and protected than in Japan. There would be a new heaven and a new earth in Europe within a year could that part of civilization put the religious question where Japan has put it. Let Europe sit at the feet of Japan and learn something. Count Okuma truly said in his last week's address: "In freedom of religious worship we are probably more advanced than any European country."

In the light of such history as this, why should any one doubt Japan's honesty of purpose, or distrust her future? The fact is Japan loves liberty with a passionate love. This liberty is steadied by a passionate loyalty, and, therefore, is in no danger of anarchy. It is the same kind of liberty that made the Anglo-Saxon race, and, like ours, is bought with the blood of many of her noblest heroes. That this liberty takes different forms from ours, that it is still fettered in certain lines by sacred traditions and by too much of bureaucracy, does not militate in the least against the two facts that Japan has already successfully grafted it onto her national life, and her face is unwaveringly turned toward a future of freedom, away from the methods of despotism. Japan never can go back.

The order of some of the events in this exceptionally peaceful revolution is worthy of permanent record:

1. The Imperial Promise, on the accession to the Throne of the present Emperor, that "public matters shall be decided by public assembly."

2. In 1873 Itagaki and others petitioned the Government to carry out the Imperial Oath and establish a deliberative assembly elected by the people.

3. In 1875 an Imperial Rescript provided for the immediate establishment of the Supreme Court and the gradual establishment of representative government.

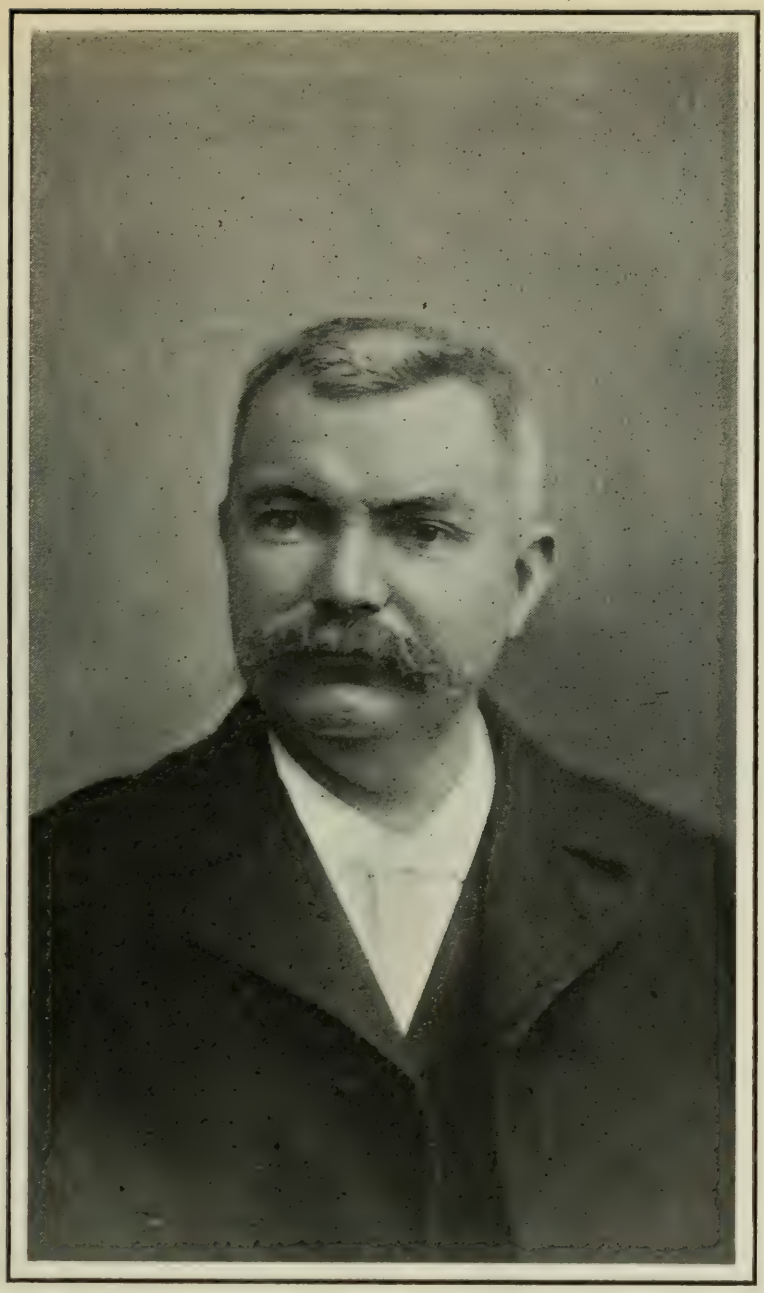
4. In 1880 the leaders of popular rights, impatient over the delay, made a national organization, and elected Kataoka Kenkichi and Kono Hironaka to present their petition to the Emperor for the immediate establishment of a parliament. This was the year of wide agitation and numerous petitions signed by tens of thousands of people.

5. In 1881 the Liberals organized their party by 98 representatives from 39 provinces, and took their solemn oath to live and die for free institutions.

6. In the following year, owing to repressive measures on the part of the Government, the test case that decided the future of liberty took place, and liberty won.

7. On February 11th, 1889, the Constitution was promulgated.

8. The Code of Criminal Procedure took effect November 1st, 1890.



9. On November 29th, 1890, the first Diet was formally opened.

10. The Civil Code went into operation July 16th, 1898.

11. On July 17th, 1899, Japan gained political equality with Western nations.

12. The year 1902 sees Japan and England in alliance.

Sendai, Japan.

CHARLES WAGNER

An Approaching Visit to America

BY THE REV. CHARLES WAGNER

[No French writer has of late appealed to the religious public of this country as has the Rev. Charles Wagner. His volume, "The Simple Life," has been in a multitude of homes. We have asked him to say a word as to his approaching visit to the United States.—EDITOR.]

To the Editor of THE INDEPENDENT:

YOU desire me to give you some definite and personal details on the subject of my approaching visit to the United States.

It is now ten years since the publication of my book, "Youth," in connection with which I have received from America proofs of hearty sympathy. I love your Republic and its ideals, and it has been my good fortune to have many correspondents among its citizens.

My book, "The Simple Life," and the warm interest which President Roosevelt has expressed in it appear to have secured me a certain recognition with the thinking classes of your country. Many friends have written to me, and many others have come to see me. Every Sunday there are now several Americans

who listen to my sermons in the congregation that assembles in the Boulevard Beaumarchais. It was here that Mr. John Wanamaker, of Philadelphia, came to see me quite recently, in order to examine my work and become acquainted with its progress. My hall has become absolutely insufficient to contain the audience of every class and of every intellectual tendency that meets to fraternize in a teaching of broadmindedness, of profound faith, at once divine and human, of fraternal regard for the poor, of joyous progress toward the future.

I have thought that it would be to the advantage of my work and of the cause which it represents if I placed myself in a more direct and personal relation with the great American public, which is interested in the questions of the future of humanity, all of which are questions of the interior life. All the achievements of humanity have their source in this thought. The quality of a civilization depends on the quality of its aspirations, and on the elevation of its sentiments. It becomes more and more necessary for us to comprehend the life of the spirit. All our progress in material things, however fine it may appear, will be only in deeds of darkness, of disintegration, if we do not succeed in maintaining the soul in its place of honor.

In this, in the higher and essential interests, we are your brothers and fellow-laborers, as we meet the diversity of situations and the subordinate interests of nationalities, in the study of our philosophies, and even our faiths. This we repeat, to this we turn as the center of our efforts and as our chief objects, to call us back to the normal life, to the simple life, which is the true life, relieved of all that which can impede its self-development.

These ideas, to which I have given expression in my books, would seem to awaken a sympathetic response in the United States. This leads me to hope that I have a message for you, and that you also have a message for me. I desire, then, to have an opportunity of speaking with you, of seeing how you live, and, above all, of appreciating better than I have yet been able to do the aspects of your inward life. I trust that my imperfect command of the English language will not prove too serious an obstacle to my purpose. I trust that Americans, always so just and kind, will be indulgent to the foreign friends who are to arrive among them next October and November.

A charming letter, which has just reached me from President Roosevelt, written after he had read with his family "By the Fireside," my last book, published by McClure, has given me great courage. It leads me to believe that I shall be well received, and to trust that some mutual benefit may result from my visit. As the days pass, my longing to see the shores of the land of Washington dawn above the horizon grows more keen and ardent.

PARIS, FRANCE

When Love Has Gone

BY CHARLES SUMNER PIKE

WHEN love has gone, do not despair,
And bind in black thy golden hair,
Look up and raise thy drooping eye,
The same old sun still lights the sky,
And June and joy are everywhere.

Come, cease thy tears and banish care
And take again thy happy air;
Be strong and hold thy hope on high,
When love has gone.

Thy heart is broke? A scar is there?
And where was love, so sweet and fair,
There's dark, red hate? Pray, pass it by
And cease thy constant helpless cry—
Forget, and lose thy hate in prayer,
When love has gone.

NEW YORK CITY

The Elevation of Tropical Races

BY BENJAMIN KIDD

AUTHOR OF "SOCIAL EVOLUTION," "THE CONTROL OF THE TROPICS," "PRINCIPLES OF WESTERN CIVILIZATION," ETC.

WHAT is the future of what are called the lower races of the world? It is one of the most pressing sociological and political questions of the age. On the day on which I had begun to write this article I was the witness in one of the main thoroughfares of London of a striking little scene. A respectably dressed man of color, walking along the pavement toward me, overheard a disparaging remark on his appearance by another man, evidently a Londoner. He stopped and challenged it, and, the opinion of some of the passers by supporting him, a fight was precipitated. A ring was formed on the pavement in a moment and the combatants went at it in earnest. It was soon over. The man of color had the best of it, and the crowd, apparently quite satisfied with the result, dispersed before the arrival of the London policeman. I had observed the incident from the beginning, and I was struck with the fact that no feeling whatever had been shown in favor of the white man. On the contrary, the opinions and sympathies of those who had heard the original provocation were, I noticed, undoubtedly in favor of his assailant. I had seen a somewhat similar encounter end quite differently in an American city, and I went away reflecting on the demeanor of the London crowd as I had just witnessed it.

As I did so, however, there came vividly before my mind another little incident in which I had myself played a part eighteen months previously in another part of the British dominions. The scene was South Africa. Armed with official credentials it had been my lot to visit one of the largest native kraals in the country. The Commissioner, who accompanied me, had been trained under one of the most sympathetic British officials, who had come into contact with the native problem in South Africa, and he was himself remarkably free from preconceived opinions of any kind on the natives. We were received at the kraal by the "king" and some of his chief men, accompanied by a few of their women folk, all being cleanly and neatly clad and surrounded by a general air of simple health and comfort very different from what one sees usually in the slums of London or New York. The king was a fine looking man, considerably past middle age. As I was introduced by the Commissioner he bowed with dignity and extended his hand to me. I took it and we shook hands in European fashion. I saw a shade of annoyance pass over the face of the Commissioner. I had committed a grave error, according to local opinion. I was afterward told that it would take some time to remove the effects of my indiscretion in thus taking the hand of the venerable looking old man as an equal.

These two incidents, each insignificant enough in itself, throw as it were a search light upon two principal aspects of the race problem as it now confronts, under a great variety of forms, the more active peoples of the world. The demeanor of the London crowd was typical. It suggested in many particulars the attitude of public opinion on the negro question in the Northern United States. Removed from immediate contact with the race problem the English people at home showed themselves not unwilling to recognize the great principle of equality irrespective of race or color upon which our civilization is founded. And yet the official representatives of the same people in a land where they are in contact with the race problem practically repudiate the assumptions underlying this theory of equality. In British South Africa, as in the Southern United States, the relationship of the negro race to the white race is unmistakable. Under outward forms of equality, under laws which in theory are no respecters of persons, under representative institutions

BENJAMIN KIDD

which admit the negro in some places to equal voting power, there is always the fixed underlying determination that the negro shall never rule; and that under no conditions shall he be admitted even to social equality. Is this condition of things destined to endure? Are the influences now at work on such a large scale upon the colored races likely in time to radically modify it? In what conditions and along what lines of development is it permissible to hope for permanent results in the elevation of what are now called the lower races?

No one who has been brought into personal contact with the conditions of labor and civilization in tropical regions can fail to be struck with the great interest of the problem which is presented by the present position of the negro in the United States. With the adoption of the standards of European civilisation by Japan we may expect the yellow races to work out their future largely under the lead and inspiration of the successful example of that remarkable country. It is principally to the tropics, therefore, and particularly to the tropics as inhabited by the negro peoples, that we must look as giving rise to those

problems of the future with which we are concerned in this article. If it were possible to regard the negro race in America as destined fully to emerge from the conditions produced by slavery, and permanently to acquire some of the stronger features of a civilization in the midst of which it finds itself the effect on the world might be incalcuable. Some of the reasons for thinking so may be briefly stated.

It is becoming increasingly evident that there are certain conclusions respecting the tropics that are likely to become accepted without serious challenge in the future. They are conclusions of great significance as affecting the future of what have hitherto been the less developed races. In the first place it is now evident that there will be no true colonization of the tropical regions on any large scale by the white races. By this is meant that the peoples of European descent are not destined to displace the existing inhabitants of the warmer regions of the earth as they have already displaced the original inhabitants of wide tracts in the temperate regions—*e.g.*, the red men in North America, the aborigines in Australia and the Maoris in New Zealand. There has been in the past in some quarters a disposition to question this conclusion. But it seems fairly on the way to be established. The physiological and other causes which, as the result of long ages of natural selection, have made certain races more able to endure outdoor work in the low lying regions of the tropics are not likely to be overcome on a large scale by any agency at present within the purview of science. Nor is any process of selection likely to acclimatize the white race within the tropics in any period of time which could be seriously taken into account. One of the most experienced of English tropical administrators, Sir Harry Johnston, has recently said that civilization would find it best to agree that, leaving the northern and southern portions of the African continent to the white races, the remaining parts must be allotted "almost entirely to the ownership of the negroes and negroids who now inhabit them (with perhaps some degree of Indian colonization)." And he continues:

> "Over the central and western parts of the continent the black man must eventually monopolize the soil, commerce and industries with the white man as a long-lingering instructor."

This leads direct to a second important consideration. It is becoming more evident every year that one of the most significant phases of the future economic rivalry of the peoples of the world will have its base in the tropics. So steadily has the tide of empire taken its course northward in the past that we are apt to forget a strong tendency now operating in the opposite direction—namely, the gradual shifting of the economic base of history southward. Scarcely any of the revelations of the present war between Russia and Japan quite equaled in its curious effect on the mind of the ordinary man an item of information briefly reported in the newspapers, and passed almost without comment at the time. The item in question consisted of no more than the statement that the Russians taken prisoners by the Japanese had found themselves with little cause of complaint in any respect but one. This was that they could get no bread. There was no such thing in the Japanese camps, for the staple of life of the armies of the nation which had organized the great campaign of 1904 in Manchuria was rice.

We are probably destined to hear much in the future of the remarkable advantages in war of the simple commissariat of the Japanese armies. But that results of such magnitude as the campaign against Russia revealed could be accomplished by a people whose staple food was rice; that this tropical or sub-tropical product was already the principal food of nearly one-third of the human race; that the cost of labor, which the fact indicated, could remain so small, while the results obtained could be so striking and effective, tended to bring vividly home to the mind the possible efficiency and intensity of an industrial competition that would develop itself in the future on a wide and organized base in the tropics.

That the pressure to develop the resources of the tropics in the future will be great and continuous and will surpass in intensity anything of the kind in the past may be taken for certain. A suggestive example of another kind is the case of cotton production. For the past

three-quarters of a century the Southern United States, under the favorable labor and physical conditions there prevailing, has grown the greater part of the world's cotton supply. The principal part of the export trade of Great Britain during the same period has consisted in the worked up products of this cotton, which have been sent to all parts of the earth. While, however, the cotton belt in the United States is a strictly limited area, the cotton consuming population of the world has been increasing by leaps and bounds. The European peoples of the world have doubled within fifty years and have nearly quadrupled within a century. The growth of civilization is at the same time rapidly extending the demand for cotton products among other races. As Germany, France, the United States and Japan, in addition to England, have of recent years enormously developed their cotton manufactures the demand for raw cotton has increased until the normal requirement may now be said to be continuously in advance of the normal supply. In such circumstances the pressure to develop other areas in the world suitable for cotton growing has become very considerable. That such suitable areas exist is established. But the two factors hitherto necessary to enable the development to take place are settled conditions of life and government, and above all an abundant supply of labor able to sustain steady outdoor work in a warm climate on the large organized scale upon which it is applied to the cotton growing industry in the United States.

This is the point at which one begins to realize the character of the problem before the negro peoples of the world, and to perceive the great interest of the attempts in progress in the United States to elevate the negro race by education and by training for the work of business, commerce and industry, rather than by political methods. Nearly every tropical country the economic development of which has been attempted is at present struggling with the question of the supply of labor for the elementary operations of industry. As the economic pressure of civilization to develop the tropics continues, the cry is everywhere going up for races able to sustain the burden of the development which the tropics are destined to undergo. In response to this pressure it is possible that we shall witness in the future almost as large movements of population in the tropics as history has already witnessed in the temperate regions. But it will be the races who are best able and who are best prepared to take their share in the strenuous development to come to whom the future of the warmer regions of the world will belong. It is the gospel of work which will be the gospel of the future in the tropics.

When I was in South Africa recently and watched the conditions being developed which led to the introduction of the Chinaman I could not help being struck with the pathos of the situation in which the negro found himself. Whether one saw him as a dock laborer at Cape Town, or loading wool at East London, or road-making in the Transvaal, or as a laborer or mechanic in the mines, engine houses and forges on the Rand, his capacity for arduous and sustained labor intelligently performed was evident and undoubted. There was no evidence visible as to any deficiency in the individual. But what was everywhere in evidence was the negro's deficiency as a member of a social type. He belonged to a type of society of the lowest possible economic development, and, therefore, to a type in which the gospel of work had hitherto been unknown.

The negroes' pay at the mines was about $12 a month, with lodging in the compound and a mealie (corn) ration. The term of engagement, however, was usually for only six or twelve months. The meaning of this was that in this short time the negro expected to amass, even at his small rate of wages, what was almost a life competency among his own people at home. His ambition was, therefore, to work for this short period and then to return to his tribe, to buy a wife, or wives, and cattle, and to settle down to a life of idleness, all future labor being done for him by his women folk. The consequences were inevitable but deplorable. The demand of the mining industry was for a hundred thousand laborers. The negro population of South Africa was some 6,000,000 or 7,000,000. Yet this total proved unable to supply

under the conditions just mentioned, the comparatively small economic demand for labor made upon it. The result was the urgent request of the mining industry, of which we have heard so much of late, for the introduction of the Chinaman into South Africa.

Here it is that we see what must happen if the negro peoples are not prepared for the demands which will certainly be made upon them in the future. In circumstances like these those who have the true interest of the negro race at heart, and who are aware of the immense possibilities before it in the regions of the world for which it is naturally fitted, see also how urgent and important it is that the negro should be brought under the influence, the training and conditions which would fit him to hold his own in the time to come. They see especially how important it is that there should be brought into being a kind of race-ethos which would set before it certain ends and ideals and steadily aim at attaining them. At a recent conference of the bishops and clergy of Mashonaland on the negro question facts of this kind were strongly insisted on. The necessity of training the race in the conception of work was held to be vital. The necessity for training not only in individual but in social responsibility was held to be largely involved in the discipline of work, and in the education which in time followed in its train. Nothing, it was felt, tended so to depress a race and to handicap it in the future as a low economic state, in which with the absence of all but the most elementary animal wants there was a lack of the first incentive to strenuous and sustained work.

As one looks at the position of the negro in the United States to-day one cannot help feeling what great possibilities lie before the race in such a country, and what a great part the American negro might play in the gradual creation of such a race-ethos as has here been described. No more powerful influence can operate in the elevation of a people than race-consciousness working toward a worthy ideal by clearly conceived means. Placed as the negro race is in the United States in the midst of one of the most strenuous types of society, it has all the opportunities of acquiring by close contact, by training and by example most of the qualities and conditions which will have a determining influence in the future in the tropical regions of the world. In all economic relations in particular it has equality of opportunity. With unrivaled possibilities of education; with an open door before it in all matters of business and trade; with the conditions produced by an epoch of slavery gradually receding in the past, it is being slowly brought under a class of influences which act most powerfully, altho slowly, in the elevation of a race. No more important base can be won for a people from which to uplift itself than the right of equal economic opportunity. It was the base from which the Jewish peoples carried the most exclusive citadels in the social and political life of modern England. Taken with education, business and economic influences are the greatest levelers in the world. "I have never found color to be a hindrance in business," Mr. Junius G. Groves, the negro potato king, is recently reported to have told Mr. Booker T. Washington; and in so saying he was only giving expression to the universal experience of men where such conditions of equality exist.

With the growth of prosperity through success in business there is no reason why we should not expect negroes who have amassed wealth to follow the example of millionaires of other races. There should be emulation to found and endow on a large scale institutions of all kinds aiming at the uplifting of their race. The demand upon the negro peoples in the United States to provide instructors, overseers, missionaries, educationalists, scientists, and, generally, organizers and pioneers in business, commerce and industry of all kinds in the coming economic development of the tropics, will undoubtedly be great if they show the least desire or aptitude to respond to it. In the development of a race-consciousness and of a race-ethos around ideals of this kind the negro peoples would probably soon find that they had on their side very powerful influences. The intellectual and economic headquarters of such a development must necessarily be in the United States. The footing of the United States is already

permanently established in the tropics. A movement among so considerable a section of its own citizens belonging to a race to whom a large part of the tropics belong almost by right of natural inheritance could hardly fail in time, if wisely directed, to enlist in its favor a very powerful and helpful national sentiment.

LONDON, ENGLAND.

The New Oklahoma

BY CHARLES MOREAU HARGER

[In the closing days of the recent session of Congress the House passed the Hamilton bill providing that the Territory of Oklahoma and the Indian Territory should be admitted as one State with the name of Oklahoma, and that Arizona and New Mexico should be admitted as a single State to be called Arizona. The bill was not passed by the Senate owing to early adjournment. The Republican majority of the House supported it, but, much to the disappointment of the people of the Territories, who are anxious for Statehood, the Republican National Convention did not adopt in the platform a plank pledging the enactment of the bill into law. However, it is expected that the measure will be carried to completion early in the next session, since the preliminary action was only taken after investigation and thorough discussion of the conditions.—EDITOR.]

WHEN, in 1906, according to the terms of a bill agreed upon by the House at the recent session of Congress, the State of Oklahoma is admitted to the Union, the new commonwealth will begin its history of Statehood with the fairest prospects of any new member of the national family. It will be composed of the present Territory of Oklahoma and the Indian Territory, and will have the advantage of a progress that is as marvelous as it is unexampled. Few realize how great has been the advancement of the Southwest or how rich are the possessions its people have acquired.

Fifteen years ago no white man had a legal abiding place in the area of the new commonwealth. In 1889 was thrown open to settlement a large reservation in the central west; later there was "opened" a strip of land, about 3,000,000 acres, adjoining Kansas, on the north of the original Oklahoma, and three years ago another tract in the southwest. These lands have been given to settlement in sudden rushes in which practically every available quarter-section (160 acres) was occupied in a day. The remaining reservations are being distributed among the Indians as individual allotments and the redskins will be permitted to sell the lands, under certain restrictions, for their own benefit.

The first comers to Oklahoma, when the lands were given to homesteading, were generally poor. Every occupant of a prairie schooner who had drifted from Illinois to Iowa, thence to Kansas and Nebraska, and finally had mortgaged his claim and wandered on in search of another home, gathered along the line and waited for the firing of the gun that announced the Government's permission to take up a farm. Some lacked even seed with which to plant the first crop, and the Legislature appropriated $5,000 to assist them. Then they needed help in planting the seed, and this was given by good-natured neighbors. Dry years came, many grew discouraged and left, but after a while things improved; frame houses succeeded those of sod; dug-outs became the cellars of better homes; trees tempered the summer heat, and the lessons of adaptability were learned to a degree that fitted the settlers for the prosperous era following.

Oklahoma ended the period of preparation and entered on that of substantial prosperity at the same time that

Bird's-eye View of Oklahoma City, April 22, 1889. Two Hours Before the Opening

Street View, Oklahoma City, As It Is To-day

the West generally began its remarkable series of fat years—with the season of 1897. Combined with a growing market for the products of the plains came a procession of good crops that wiped out debts and imbued the farming communities with hopes of permanent wealth. The newer lands shared most fully in this gift of good times, and the settlers of Oklahoma profited in large measure from its results. They have added year after year of advancement until they have produced a wonderful picture of agricultural development—the greatest ever shown in a similar length of time by any part of the nation.

Everything favors the pushing, thrifty population, made up alike of nervous sons of New England, hardy natives of the Middle States and wide-hatted dwellers of the Gulf section—95 per cent. of all being of American blood. The climate is that of Tennessee and North Carolina, modified by the sweeping winds that have for their playground the vast plains region. The rainfall is greater than in similar longi-

Shawnee, Eight Years from the Prairie, Showing Broadway

tude further north in Kansas and Nebraska. The geological maps show that the line of rainfall during the growing season bends westward after crossing Kansas and favors the territory to the south. Watered by frequent streams and by the Arkansas and Red rivers, with their branches, with the Wichita Mountains on the south and a soil needing only cultivation to produce generously, it was the fault only of the settler if he could not succeed. Wheat and cotton, corn and sugar cane, alfalfa, millet, barley, fruit of all kinds and vegetables of every description flourish in the median climate that mingles north and south in its character.

Naturally the chief occupation of the Oklahoman is agriculture. He prides himself on his accomplishments in extending his knowledge of the Territory's possibilities.

"I see you are raising both corn and cotton," was asked of a farmer near Norman. "Thought you were from the North."

"I am—came from Wisconsin."

"Then how do you know how to raise cotton?"

"Well, you see my neighbor came from Texas and we got to talkin' it over. He agreed to show me how to raise cotton if I'd give him some pointers on corn—so we're both better off."

That is the characteristic of the settlers—helpfulness; it has made them independent beyond their dreams or expectations.

The railroads have helped mightily in this development. When the various "openings" took place their advertisements drew men from every corner of the nation. At the "runs" thousands lined up who never secured claims. When the drawing took place in August, 1901, I sat on the platform at El Reno and watched a sea of faces turned anxiously toward the great box from which fortunes came—but many went away disappointed. Then came the homeseekers' excursions, when trainloads of settlers were taken into the Territory to locate either on the lands open to homestead in the extreme western portion, where the fertile acres meet the grazing-prairies, or to buy out the people in the already developed eastern section. Generally, it was the latter, for the home-seekers had sold farms in Iowa and Illinois for $75 to $100 an acre, and were willing to pay liberally for the new homes. But they found every quarter section occupied. Land values advanced in proportion as the demand increased. To-day Oklahoma land is higher than Kansas land adjoining it on the north. The very name Oklahoma seems to exercise a fascination on the buyer, and he pays $5,000 for 160 acres, moderately improved, and thinks he has a bargain.

"What becomes of the families that sell out?"

Shawnee, Eight Years from the Prairie, Looking Northeast

"Oh, they move on to some place where land is cheaper; a Westerner is always ready to move, you know."

Nor have the railroads been neglectful of the development of the Territory itself. The Rock Island-Frisco system and the Santa Fé system, with branches reaching into the heart of the Territory, touch almost every prominent town. The Orient line and the Denver & Gulf cross its western portion. Altogether 1,929 miles of track serve the people. During the past half decade has the greater portion of this been laid.

With the railroads came the towns. That is, the newer towns. In the days of the "openings" town-site companies swarmed upon the land, but many of their attempts failed. The railroad building rearranged the boomers' map. For instance, eight years ago the site of Shawnee was open plain; two railroads were built, crossing at that point; to-day there is a city with 3,000 people, trolley cars and every evidence of thrift. Fifteen years ago Oklahoma City was a bare prairie; now it has 32,000 people, ten miles of trolley line, dozens of jobbing houses and manufactories. Guthrie, the capital, has nearly the same population and is likewise a marvel of prosperity. This development is not ceasing. Official reports for the past year covering 40 leading towns show 628 business houses constructed, 197 in course of erection; 2,915 residences built, 609 being completed. This does not take into account the farm dwellings which are undergoing a rebuilding throughout the territory.

It is needless to say that people who have accomplished this have been thoughtful of the educational and religious needs of their communities. A richly endowed school system, normal schools and colleges, offer every child opportunity for education. The church work thrives under the management of energetic Western leaders, who give to it the push and vim that mark Western life in all its manifestations.

In 1890, one year after the first opening, the Territory had a population of 60,416; in 1892, 133,100; in 1894, 212,635; in 1896, 275,587; in 1898, 311,400; in 1900, 398,331; in 1902, 541,480; in 1904, 650,000. No wonder the Territory is prosperous, with such a stream of immigration pouring into its borders. And it is. The assessment is on a basis of one-third real value, yet the assessors return $84,134,172 as the worth of the property last year, a gain in a single year of over $11,000,000.

Such is Oklahoma, a decade and a half ago the home of the Indian, of which race only 12,000 remain in the Territory. It is busy, pushing, assertive. It raises 30,000,000 bushels of wheat, 25,000,000 bushels of corn, 230,000 bales of cotton annually. Cotton gins and wheat elevators jostle each other in the towns, cotton mills and factories are among the promises of the near future. Out to the

West reaches the old "No Man's Land," an upland grazing country where herds and flocks grow fat the year round. The people are well out of debt because, being homesteaders, they could not mortgage their claims for several years—and then, they did not have to do so.

The young man is dominant in Oklahoma politics as well as in business. The spirit manifest in the advertising of the rival towns is boomlike, yet it is based on substantialities. In its 38,800 square miles—nearly as large as the combined area of Delaware, Maryland, Massachusetts, New Hampshire and New Jersey, larger than either Indiana, Maine or West Virginia, and nearly the size of Ohio—it has a population larger in proportion to area than a dozen States. Little wonder that it desires Statehood.

The Indian Territory, which is to be admitted as part of the new State, lies directly east of Oklahoma, but differs from it as much as Missouri differs from Kansas. It is marvelously rich in soil and mineral deposits, but in a different way from its sister Territory. Forests, rather than open prairies, greet the traveler; little patches of corn and cotton appear, rather than broad reaches of wheat and small grains. It is black soiled, well watered, fertile and attractive. It has 31,000 square miles, about the size of Indiana, and its population is well over 550,000. Of these only 75,000 have Indian blood in their veins. The full-blood Indians number only 8,000; less than 20,000 have more than half Indian blood, and about 40,000 one-quarter Indian blood.

In a modern office building at Muskogee the Dawes Commission is distributing all the land among these people who have Indian blood. All the others are interlopers without original rights in the Territory. Among the Five Civilized Tribes is the land being divided. The membership of the tribes with the land belonging to each in common is:

	Population.	Acres.
Choctaw	20,250	11,338,935
Chickasaw	11,500	
Creek	15,000	3,040,000
Cherokee	35,000	5,031,351
Seminole	2,757	366,000
Totals	84,507	19,776,286

The work of the Commission is to appraise the land, enumerate the Indians and see to it that every adult and child shares equally in the distribution, giving deeds from the Government to the individuals. This process is so far along

Ponca City, a New Town

Cotton Compress in Oklahoma City

that two years more are expected to complete the task. Then the white man gets his chance. He can buy or lease the Indian's land under certain restrictions and proceed to make the reservations into farms. The Indian will then become a citizen and cease to be a ward of the Government.

The white man has already made inroads on the coveted lands. The Indians have tilled but a small portion of their reservations—the remainder has been leased to the whites for farming or for grazing. This accounts for a portion of the white settlement. Then there are 400 towns with more than 200 people each; three have more than 10,000 and twelve more than 5,000. In the towns, which have been laid out by the Government and the lots sold at auction, the proceeds going to the Indian treasury, the whites have been allowed to attain real estate titles. But until the deeds have been issued to the Indians for their allotments no farming land could be thus acquired. The coal mines, among the richest in the West, have been worked by the whites, but the Indian tribes have profited therefrom.

Long has the white man coveted the Indian Territory, with its timber, its rich soil and its minerals. He has pushed in with his business, with his banks, with his stores and his cotton gins—waiting impatiently for the day when he might possess everything. A dozen oil wells at Bartlesville are producing large flows, all located on the town site. Many look for another great oil field when the "proved area" can be fully established.

The endeavor of the whites to possess the land is earnest and unremitting. As soon as an Indian obtains his deed he is besieged by eager settlers who wish to buy such portion as he can sell (one-fifth must be kept for 20 years as a homestead) or to lease on easy terms. The Indian is willing, and it will be only a short time until he has disposed of his patrimony.

The dwellers in the Indian Territory welcome Statehood of any kind. The whites have been unable to secure public schools except by private subscription; outside of the towns they have been subjects of the Indians, who lived in comparative luxury off the income derived from the white renters. They did, however, hope for separate Statehood, intending to call the commonwealth "Jefferson." The name "Indian Territory" has done much to hinder progress; few understand exactly the meaning of the term —the property of Five Civilized Tribes with laws that compare favorably with those of the whites themselves. The

Harvesting Wheat on Ranch No. 101

union with Oklahoma will, it is feared, give the more advanced western portion an advantage in obtaining the capital and the location of public institutions. That there will be a strong rivalry for these prizes is probable, but the eastern portion will be able to make a good showing. It has over 2,500 miles of railway, the same systems as operate in Oklahoma, with the addition of the Missouri, Kansas & Texas and the Missouri Pacific, having well covered the land. Over 100 national banks are in operation, 75 of them organized in the past year; 200 newspapers,

Typical Harvesting Scene

20 of them dailies, keep the people informed of the world's news.

A large Southern element is noticeable in the population, but it is mingled with the energetic immigration which has poured in from the North, and is rapidly becoming used to the push and enterprise of the new West.

The new commonwealth, when the two Territories have been united, will be as large as Illinois; it will have a million and a third population; it will be practically out of debt and fitted to produce crops unexcelled by any Western State. With its promise of future development, its progressive population and its undoubted natural resources it will be an example of State-making to which Congress can point with particular satisfaction.

ABILENE, KAN.

Court House in Elreno

Haiti, the Prey of Modern Finance

BY FRANCIS TREVELYAN MILLER

[Mr. Miller is editor of the *Connecticut Magazine*, and has spent some time in studying the conditions of government in the West Indies.—EDITOR.]

SIGNIFICANT news comes from Haiti, where poor old President Alexis Nord, now in his eighty-ninth year, discouraged by internal strifes and Government robberies, threatens a massacre of the whites.

"The Republic cannot long exist," said a member of a strong diplomatic corps, representing one of the greatest European powers, as I conversed with him some time ago during a sojourn in the Greater Antilles. "The Government is disorganized; the peasantry is deciv-ilizing; the judiciary and army are corrupt. It will soon be necessary for a foreign nation to step in and assume control to save investments."

I spent three days with General Frankson, of the German Embassy, at Port-au-Prince, while he was recuperating from his arduous labors. We sat on the veranda at the cottage of a friend in the beautiful little village of Mandeville, far up in the palm hills of the parish of Manchester, in the Island of Jamaica. I well recall the conversations in which the stalwart, six-foot German diplomat, carrying the scars of thirteen duels, leaned over the tea table and vigorously denounced existing conditions in the first negro re-

Dessalines, Who Became President and Vowed Eternal Hatred Against the Whites

public in the world. From my note-book I take these fragments:

"While Santo Domingo and Haiti are on the same island, their interests are as diverse as tho they were on different continents. A wilderness of tropical forests divides them, and the national tongue of the former is Spanish, while that of the latter is French. Both in pretense are republics; Santo Domingo models from the Constitution of the United States, and Haiti more closely follows the French. In their present state of revolution both are burlesques."

"Santo Domingo," exclaimed the General, who has for several years been a leading foreign figure in Haiti, "must be taken up by the United States. It must be that the Monroe Doctrine interferes, or it would have been done long before this. Under the conditions, however, it would be the best thing that could happen to the country, and Europe would not interfere. The American sugar interests are so great in the Republic that they must be protected, and other nations would profit by trade with the rich country if stability could be assured."

"As for Haiti," he continued, "it, too, must change its methods of dealing with foreign Powers or soon become their victim. Life and property are unsafe in its jurisdiction and matters are growing continually worse. It is a land of natural wealth, and its resources will be appropriated by some one very soon unless order is restored."

Since my several conversations with the General I have found that the Republic of Haiti is practically in the grasp of Germany and France. Altho Alexis Nord has endeavored to restore peace and rebuild the credit of the nation, he has met with little co-operation from the million and a quarter peasantry; murder is rife; public treasuries are still plundered; his own life is in imminent danger. It is surprising to me that he has not sooner fallen victim to assassination. President Nord is a pathetic figure in the *rôle* of the world's rulers to-day. When his country began to degenerate, he entered its politics and rose from a thatched hut to the executive palace.

"I shall rid the country of robbers," he said. "I shall drive the men who have been defrauding the Government to prison. I shall stop the looting of public funds and suppress revolutionists."

I was in the city of Kingston, Jamaica, when the first cargo of exiles arrived to seek safety under the British flag. They threatened revenge and hinted that it would not be long before they stole back to Haiti and made the President regret his action. The perpe-

trators of the bank frauds and Government financiers were thrown into prison, and again their unprincipled followers repeated threats of vengeance.

In the mean time the President, whose honesty and sincerity of purpose are beyond question, counseled with his Cabinet ministers regarding the establishment of a sound monetary policy. He discovered that the finances of the nation during the turmoil of preceding administrations had fallen into the hands of foreign bankers. Realizing an opportunity to profit as money-lenders, a syndicate slowly but shrewdly gained control of shipping interests and all money channels. While revolutions were being fought and a demoralized army was protecting the state, the foreign bankers caught the opportunity for private gain. They supplied great sums to suppress revolutionists and to meet emergencies as apparent benefactors. Their willingness to make loans at hazardous risks gained them the confidence of the administration. Suddenly there came a realization to President Nord; the old black ruler found himself helpless in the net of money-lenders, and his country the prey of its creditors.

Haiti to-day is not a Republic; it is merely a poor debtor. It is even worse than that—it is a pauper. Foreign banking houses hold the reins of government, and the President is at their mercy. It is not a case where modern finance has cornered the beef market, or monopolized the oil trade, or formed a trust in sugar. It is more tremendous in purport than any of these; it is an actual occurrence where an apparently beneficiary syndicate has taken advantage of a nation's misfortunes and reduced it to monetary slavery.

It is with these truths glaring him in the face that white haired Alexis Nord, discouraged and heart broken patriot, has risen in public assembly, and declared:

"The foreign population has plotted against our Government. They are working to overthrow the Republic, and have put up exorbitant rates on exchange and prices we cannot meet on goods necessary for living. The rate of exchange is 600 per cent. It is conspiracy. I have decided to defend myself, whatever may be the cost. I warn them to remember what happened in Haiti in 1804."

This last statement has alarmed the foreign residents, and a massacre of whites is feared. The President's reference to 1804 is a tragic warning, for it was in that year that Jean Jacques Dessalines arose from slavery to Governor-Generalship of the island for life, calling upon his people to "render war for war, crime for crime, outrage for outrage, to the European cannibals who have so long preyed upon our race." As a result of this proclamation there was a general

The Palace of the President of the Republic of Haiti

massacre of nearly all the whites, including aged men and women, and infants in arms, numbering more than 2,500.

It is very possible that the death-note of the Republic of Haiti has been sounded, and that the end of this struggling negro Government is near.

HARTFORD, CONN.

The Tragedy of the United States Steamship "Princeton"

BY MRS. P. Y. PEMBER

THE winter beginning December, 1843, opened a brilliant season at Washington. President Tyler was known to be seeking a wife to share in the highest honor a nation confers, and there was more show and larger expenditures than were usually allowed under former administrations. The army and navy also occupied strong social positions as successful defenders of the prestige of a comparatively young republic.

About New Year the principal topic of conversation among the officers of these departments was the proposition of Captain Stockton to have molded a monster cannon as a more efficient weapon than those then in use. The Ordnance Department was strong in its disapproval, openly expressing its opposition. It cited the inefficiency of the huge cannon formerly used by the Turks, and predicted the danger of welding together successive coats of metal, on the ground that by the time the last layer would be applied the intense heat would disintegrate if not pulverize the interior ones.

The extreme partisanship of Captain Stockton's friends produced the usual antagonistic effect, and society was divided between cannon and anti-cannon adherents for some weeks. Strong influence was brought to bear upon President Tyler to discourage the scheme, but Captain Stockton was not only a man of great personal magnetism, but an important member of a large and influential family and a great favorite in all circles; and so few were surprised when early in February, 1844, rumors were circulated that the monster cannon had already been created, and been mounted on board Captain Stockton's steamship, "Princeton," then lying in the channel of the Potomac at Geisborough, and that by the fourteenth of the month four hundred invitations would be issued to affected and disaffected alike, including the President, the Cabinet, the Diplomatic Corps and every one else of importance in the District.

The Ordnance Bureau at once put its veto on any member of its family being present, altho official etiquet would compel the acceptance of the courtesy, and tho the Washington world spoke generally of danger, it was in whispers, and it was a gay and brilliant company that boarded the "Princeton" at Alexandria on Washington's Birthday.

The monster gun was an imposing structure, carrying a ball weighing 225 pounds. The day was cloudless, the women elegantly dressed, as was also the ship. The bureau had forgotten its antagonisms and prophecies of disaster. Commodore Stockton, this title by courtesy, tho only at that time a post captain, received his guests in full naval uniform. The occasion was to him the culmination of triumph after a long fight against great odds—opposition headed by the whole Ordnance Department, backed by the consensus of opinion.

Just below Fort Washington word was passed around that the great gun would be fired, and all flocked to the bow of the boat. The report was no louder than expected from a cannon of such large caliber, and curiosity satisfied, and danger apparently passed, the "Princeton" steamed gayly on to Mount Vernon. The women, after enjoying their elegant lunch in the cabin, made way for the men, for the cabin was small, and while so engaged they were notified to come up on deck as the cannon would again be fired.

I was a very youthful spectator, a guest of Secretary of War Wilkins, and taken surreptitiously on board by him. Being on official attendance on President Tyler he had no leisure to attend to me, so I was much pleased when the Mexican Minister, Señor Almonte, finding me wandering around, kindly inquired if I would like to see the Peacemaker fired again. A child of fifteen does not recognize danger, so we took our position, leaning against the bulwarks to the left of the cannon.

The steamer slackened her speed opposite Mount Vernon, but altho the President had been twice summoned and his Cabinet awaited him, his voice could still be heard through the skylight, laughing and talking with Secretary Wilkins over their wine. Along the right side of the cannon were ranged Secretary of the Navy Upshur, Secretary of State Gilmer, Commodore Kennon, Mr. Virgil Maxcy, lately returned from a diplomatic residence at The Hague, and Senator Gardner, of New York, father of the lady on board whose engagement to the President had that day been announced.

President Tyler still lingered in the cabin till a third message reached him, and then he laughingly called out, "Tell Stockton to go ahead; neither Wilkins nor I like firearms." Captain Stockton and Lieutenant Johnson were then standing close to the breech of the gun, and after a few words the latter applied his light. The report following was moderate.

Then fell that strange stillness which follows sudden calamities, but only in the immediate vicinity of the explosion, for, undisturbed as yet, the company on the quarter-deck could be heard laughing amid the buzz of many voices. Suddenly overmastering all sounds Lieutenant Johnson's trumpet rang out sharply: "Lower a boat, a woman overboard —send all aft, stretch a rope across the deck." He had sprung up a few feet in the rigging to see better and to find that no one had been blown overboard.

Some minutes after, Captain Stockton was led below by two sailors, all the bravery of the morning gone, his full black wig, the fashion of the day and a survival of George the Fourth, blown away, and his head bound up in cloths saturated with blood. His wounds were not physically deep, but his mental anguish great—then, and for many years after, for tho a gallant gentleman and an honorable man, he allowed his opinions to become convictions and had forced them, with terrible results, in opposition to wiser heads trained in ordance ethics. His full black whiskers meeting under his chin were burnt to a crisp, and for many weeks he was not willing to be seen.

Up to this time none but the few spectators standing around were aware of any disaster, for the cannon having been already successfully fired once, there had been no further curiosity, but the smoke, instead of issuing from the bore of the gun, was pouring from the side, where the members of the Cabinet had been standing, and lay so low and so thickly (for, the steamer remaining motionless, there was no wind) that the extent of the disaster was hidden.

I was still leaning against the bulwark opposite the place where the official group had stood when General Almonte took my hand to lead me away in obedience to Lieutenant Johnson's order. "Has anything happened?" I asked, anxiously. At that time our official relations with Mexico were much strained and there was considerable sarcasm in his manner as he answered: "It is to be hoped that your Peacemaker may do as much harm to its enemies as to its friends."

As I was led away I could see lying parallel with the cannon and close against it a ponderous mass of metal blown out from its right side—a black bulk that disguised any appearance of

blood, and protruding from the end was the gold epaulet of Commodore Kennon.

Still from the quarter-deck floated sounds of merriment, till suddenly fell a dead silence, and then a woman's single shriek, appalling from the contrast of the gayety of a few minutes before. Mr. Mason Graham had told Mrs. Gilmer of her husband's death. Mrs. Dolly Madison held her in her arms, dropping genuine tears down her own less genuine cheeks. They fell pink, but not the less sympathetic. Mrs. Madison affected the costume of a past generation and wore her kerchief crossed upon her bosom and a small muslin turban for head gear, very pretty and coquettish.

The terrible tidings had now spread. Miss Gardner clung in terror to the President, who seemed stunned and was very quiet. Besides Mrs. Gilmer, there was only one wife on board, Mrs. Kennon. She had been married but one year and had postponed the christening of her first child to the 28th, so that her husband could be present. She was a very handsome woman, and had been a belle when Britannie Tudor. There were few to question amidst the general confusion, so when she noticed me coming from the scene of disaster she asked if I had seen her husband, in the imperative tones which were natural to her. "Oh, he is there. He is all right," I answered, vaguely, for I was young and foolish and frightened. She said: "He is dead or he would be at his wife's side," and quietly drew her veil down, said no more nor troubled any one with her grief further.

The mass of metal was lifted with difficulty from the bodies of five men, who never felt the sudden blow which crushed them. They were struck down prone, backward, in a straight line, except that Mr. Maxcy had stood a little behind the others, as the position of the bodies proved — Gardner, Upshur, Maxcy, Gilmer and Kennon. Secretary Upshur's watch, face inward, was driven into his ribs, marking the moment of his death. Colonel Benton, of the Senate; Lieutenant Hunt, of the "Princeton," Mr. Robinson, of Georgetown, and seventeen seamen were injured.

The scene on the deck became pitiable —the sobs and wails of grief stricken women and their friends; the constantly recurring sight of suffering seamen borne past, streaming with blood; the general belief that the extent of the disaster had been concealed, and, to add to the wretchedness of the surroundings, the change in the weather; for what had been the brightest sunshine was now a leaden hued sky, pouring down sudden gusts of rain, depressing beyond description.

At four o'clock it was decided to signal to the first available passing steamer and send the guests to the city, so we were soon transferred to a river boat, and compelled, in consequence of rain, to crowd in the cabin—too small to accommodate that load of misery. She was clumsy and very slow, so that we did not reach the city before eight in the evening. Some craft must have forestalled us and carried the news there, for bells were tolling dismally and all Washington seemed to be awaiting us at the wharf. The reports had far outstripped the reality, terrible as that was. Too young to protest or even to understand that after so horrible a day I needed rest and should have it, I was seized by a group of anxious wives, whose husbands were still on board the steamer, and subjected to a vigorous cross examination regarding their safety, and, at last, even when satisfied, some one suggested, "Do take her to poor Susan Upshur."

Perhaps she was the only person in the city that tumultuous night who was ignorant of the day's tragedy. We found her in her dressing room awaiting her husband, in her pale blue wrapper with her pure complexion and golden hair; and then much tried nature asserted herself, refusing to be harried further by having to tell a happy wife that she was a widow. She heard of her loss quickly enough.

The city streets were thronged through the night, for no one seemed to think of sleep. The bodies of the dead remained on board, so crushed that it was doubtful to whom belonged the different limbs. The next day they were removed to the Executive Mansion, where they lay in state, but necessarily concealed from view. Special messages were sent by President Tyler to both houses of

Congress, with details of the calamity, and a joint committee of five Senators and five Representatives arranged the funeral, to take place the 2d of March.

The escort consisted of the President and those left of the Cabinet, all officers of army and navy, the regular army of the District, commanded by Gen. Winfield Scott, the entire Diplomatic Corps, Senate and House of Representatives, civic procession and militia.

The funeral *cortége* was unusually impressive from its great length, stretching for miles beyond the avenue, for it followed the remains of five of the most distinguished citizens, followed by their weeping families. All places of business and houses along the route were closed and draped in crape, and truly a nation mourned.

They died together at the same moment, and were buried in the same vault, except Mr. Maxcy, whose body was carried to his Maryland home. There was but little pomp and no splendor displayed, but there was a universal sympathy with the living and sorrow for the dead.

Those were not the days of sensational headlines and agonizing columns of harrowing details; for on examining the newspapers of the day, kept on file in the Congressional Library, for the purpose of verifying dates, only in the columns of the *National Intelligencer,* then edited by Mr. Seton, could I find a brief notice of this disaster, covering not much more than half a column. Possibly sympathy for Commodore Stockton, who was sorely smitten with remorse, at the result of which he was the guiltless cause, and who with his large connection was much respected in Washington, prompted this forbearance.

New York City.

In Exile

BY SEUMAS MACMANUS

It is a favored land, of sun,
Of joy and heart's delight;
Where airy Beauty wings the day,
And Pleasure wings the night,
And lives float smooth and sweetly
As glad bee's honeyed hum:
I know, I know, I'm happy here,—
Yet thoughts do come,
Till I close my heart with a hard, sharp snap.

The thrush is in the tall treetop—
He calls both loud and sweet;
A glad blue sky bends over me,
Wild flowers are round my feet,
The bloom is on the sweetbriar bush,
The down is on the plum:
I'm happy here, I know, I know—
Still thoughts do come,
And I close my heart with a hard, sharp, snap.

My father's hill was bald and bleak,
My father's hut was small,
The wind that moaned o'er Barnahask
Was drear as Death's cold pall;
Yet true that when I looked goodby
My soul within was numb:
But now, I *know* I'm happy here—
Still thoughts *will* come,
Tho I close my heart with a sharp, hard, snap!

Mount Charles, Donegal County, Ireland.

Literature

Wagner's By the Fireside*

As the author of "The Simple Life" Mr. Wagner is already well known in this country, and this last volume will add to his reputation. There is a distinction between artificial sentimentality, which may be used to exploit a vice or a weakness, and a wholesome sentiment that binds the affections to whatever is good or lovely or lasting. And it is the recognition of this difference which determines in a measure the value of these essays. But they are also recommended by the definite, objective manner with which the author presents his conclusions. They are not the lowest common denominator of much abstract thinking, but they gather about a place and the blood kin of our memories. Many wise men are writing learnedly, even eloquently, upon the crowd, the market place, the general situation; and their dissertations include sociology, religion, politics and all the other changing platitudes of the great masses, but this man has made his way back through these public thoroughfares of thought to that little family corner of the world upon which they all depend, and he has distilled into the life about the fireside all the ethics we need between the cradle and the grave. He coaxes the reader home again with a thousand reminders of the ancient peace and security of that dear place. This is a beneficent thing to do when in the search after new experiences we have wandered far afield and are about to become homeless in consciousness. And not only is the "roof tree" recalled, but every member of the family, from the grandparent to the youngest child, is reinstated as we remember them in the sunburst of youth when the heart was fragrant with innocence, gayety and affection.

These are days when the ablest minds are employed in correcting, or at least questioning, the science and scriptures of the past. We have the iconoclast spirit developed to the point of inspiration, if not to madness; and at such a time it is restful indeed to come upon a constructive mind, like that of Wagner's, who would hold fast our very real inheritance from this same apocryphal past of records, traditions, heirlooms, and, above all, the home, that oldest of human institutions.

> "If a man had no need of it for cover and defense, he would still be driven to find somewhere in the wide earth a corner of his own, to attach himself to some familiar spot. . . . He has need of creating a world in his own image, to help him keep his base, remain faithful to himself, and his dwelling is this world in miniature."

But not less attractive is the author's courtesy and intelligence in discussing the somewhat neglected phases of young life. He places an emphasis upon the dignity and rights of childhood without going to the sentimental extreme of some writers upon this subject. Nor does he regard the romantic period of adolescence with a vulgar leer.

> "In youth we are in love with one another for grace, for strength, for kindness of the heart, wit, vivacity, freshness, the profound light of the eye . . . We have reason for being in love and for never tiring of telling the reason why."

And if the future of the generations lies hidden somewhere beneath this morning radiance of the spirit, it's nobody's business but God's, who sweeps the golden pollen from one to another when lilies court in the spring winds.

There is much advice given, shrewd expositions of human nature, showing the author's practical acquaintance with men and women and little children. And while it would be difficult for any one family to practice so many virtues, the same thing may be said of this volume that President Roosevelt said of "The Simple Life." "It should be used as a tract throughout the country."

* By the Fireside. *By Charles Wagner.* New York: McClure, Phillips & Co. $1.00.

Four Novels of Carnal Life

It is a curious coincidence, if it is nothing worse, that four of the strongest and best written novels of the year should deal so largely with phases of social life which the public, either from policy or taste, chooses to ignore as far as possible. But whether fiction dealing with vice is necessarily vicious is a question still debated, and it would be difficult to find a group of books about which people would differ more widely than the four under consideration. We are not all agreed as to the moral influence of drunken helots or Biondi's "Saturnalia." But none of these novels belongs to the prurient and suggestive class. The lusts of the flesh may be somewhat nakedly disclosed, but they are not roseately bedecked. If one is to look at the seamy side of life it is important that he should see it as it is.

The two first of these novels deal with a question, a situation. In *The Woman with the Fan** this is, What will happen when a woman, adored by all for her beautiful complexion, is hideously disfigured? In *Dorothea,*† What will happen if a pure woman is forced to live in an immoral environment? But when we say these are in a way problem novels it is not meant that, as is so often the case, the characters are marionettes. On the contrary, they are all very human, all too human.

Mr. Hichens first attracted public attention by his "Green Carnation," a very improbable novel, which was later proved in the courts to be altogether too true. Since then he has become more and more of a symbolist, and has pruned his style of superabundant epigrams. *The Woman with the Fan* is cursed with a beauty so great as to relieve her from the need of cultivating any other and more spiritual attractions. Her whole life is bound to the carnal plane, and she scoffs at those of her male friends who say they would love her just as much if she lost her beauty. That she is not altogether wrong in this estimate of the kind of men who surround her is proved when by an automobile accident her face is burned and horridly disfigured for life. The solution to the problem, if solution it can be called, is the same as that given by Bernard Shaw, in the witty play of "Candida"; that the woman goes to him who needs her most.

It happens that one of the foremost English novelists is a Dutchman, but we are all thankful that Mynheer Joost M. W. van der Poorten Schwartz adopts a simple name doubled. In the sub-title of the book Maartens makes the same challenge as Hardy, but there will not be the same dispute as to the propriety of the adjective. Whatever may be thought of "Tess of the D'Urbervilles," Dorothea is a pure woman. Brought up in a Dutch village by her aunts, she is requisitioned by her father, who wants her money to support his fast life, and she is suddenly plunged into the society and salacity of Paris and Continental watering places. Surrounded by people who are mercenary, brutal and licentious, destitute of family affection, she follows in her acquaintance with vice the steps given by Pope; she first hates, then endures, pities and embraces, if not vice, at least, a vicious husband. The novel is a Rembrandt picture; but such only in regard to its moral chiaroscuro. It is a delightful book to read aloud; to stand with an appreciative friend and watch each minor character grow into reality under the deft touches of the Dutch artist.

The strongest anti-imperialistic literature is published in the form of fiction, in such stories as Kipling's and Dolf Wyllarde's.‡ If anything would induce the white man to lay down his burden it is the account of the backbitings, jealousies, intrigues of garrison life in such a tropical island as *The Rat-Trap,* which we are told is a British dependency near Madagascar, where the temperature is too high for Anglo-Saxons to live respectably. The plot is an old one, dating at least as far back as David, for it is the story of Uriah. The central character is pre-incarnation of Nietzsche's "Superman," an excellent Colonial Governor, unrelenting and unrepenting in love and war. It is a man story, not because it is about a man or by one, but

* The Woman with the Fan. *By Robert Hichens.* New York: Frederick A. Stokes Company. $1.50.

† Dorothea. *A Story of the Pure in Heart. By Maarten Maartens.* New York: D. Appleton & Co. $1.50.

‡ The Rat-Trap. *By Dolf Wyllarde.* New York: John Lane. $1.50.

because life in all its passions and problems is so obviously viewed from a masculine standpoint. It is written forcefully, vividly; the reader feels the heat and humidity, sees the African trees and landscapes, and in the lightest society chatter he is subconscious of possible tragedies, of an outbreak of elemental passion or a rising of the natives. It is like really living on "Key Island"—and living there is not pleasant. To put a list of characters in the front of the book is a good plan. To have given a map of the island as Stevenson did would be still better.

Mrs. Voynich, in search of a sufficiently disagreeable setting for her latest story,§ goes to the Russian prisons, the horrors of which she, or, at least, her husband, knows so well. Many of the readers she gained by "The Gad-Fly" she lost by "Jack Raymond," and these will probably not care to make the acquaintance of *Olive Latham*. The degradation of Russian peasantry, the emptiness and viciousness of the life of their overlords, the symptoms of incipient insanity, the failure of high purposes and the hopelessness of heroism are not subjects which most of us like to read about, but as presented by Mrs. Voynich they have a horrible fascination which few of us can resist. But this novel is not liable to the objection raised by some to her earlier work, since it does not deal with the problems of illicit love. Mrs. Voynich is the novelist of cruelty, but in the characters of the Nihilist and the father she has shown here, as in "Jack Raymond," that she can give us examples of courage and devotion, both to ideals and persons.

Pearson's Life of Governor Andrew*

MR. PEARSON has given us here one of the books that count, a healthy book, about a hero who was not only fearless, but simple and tender, and who had some of the weaknesses of a hero as well as the strength. Tho his field of work was local, his fame was national, as "the great War Governor" of Massachusetts. He was no "man of iron," but he loved the right cause sturdily and uncompromisingly.

As early as 1834 Andrew was won to the anti-slavery cause. He went with the statesmen, however, rather than the moral agitators like Garrison and Phillips, tho he was not without sympathy for them. He would fight slavery, "but it must be crushed out, not together with the Constitution, but through the Constitution."

Andrew was born in Maine, but became a lawyer in Boston, and, in 1857, he so pleased the Free Soil and Abolition factions of the Republican party by a speech against the defenders of the Fugitive Slave law that in 1860 he was nominated and elected Governor of the State. In that office he did the work that won his honorable epithet. With tireless energy he enlisted 146,730 soldiers and 32,000 sailors, armed and sent them to the front, caring for their wives at home, and providing hospital service in the field. All this was done while the ordinary civil affairs were receiving distinguished attention—even to originating the Board of State Charities, and starting the Massachusetts Institute of Technology. All this was so done that his friends could truly say, "No man believed in the people more, or truckled to them less."

When the war was over the generous spirit of Andrew was shown in his attitude toward reconstruction. He did not want the question of suffrage for the colored man raised at once. The negro ought not at once to be the subject of political controversy. The good in the Southern people must be cultivated first. He thought, however, that the suffrage ought to be subject to national rather than State control. He had a firm conviction that the Southern States should return to the Union under the leadership of the men who took them out of it. "No Rebel Voters" was a favorite dogma, he said, "but it is impossible in certain States to have any voting by white men, if only 'loyal men' . . . are permitted to vote." "The true question is, now, not of past disloyalty, but of present loyal purpose." Andrew be-

§ OLIVE LATHAM. *By E. L. Voynich.* Philadelphia: J. B. Lippincott Co. $1.60

* THE LIFE OF JOHN A. ANDREW, GOVERNOR OF MASSACHUSETTS, 1861-65. *By Henry Greenleaf Pearson.* Boston: Houghton, Mifflin & Co. $3.00

lieved in the "co-operation of the strongest and ablest minds and the natural leaders of opinion in the South." While he was thus protesting against the general unreason he yielded up his office, and two years later yielded up his life.

The biographer's work is true and conscientious, tho in his preface he is almost naïve in his apology for his virtue in "reproducing in type the idiosyncrasies of the writers in matters of punctuation, capitalization, spelling and even grammar." One might think that he really was in doubt as to the correct method. There is an innocent quaintness that takes us back to the days when Jared Sparks *corrected* Washington's letters.

The New International Encyclopædia. Vols. xv, xvi, xvii. Rice to Zyrians. New York: Dodd, Mead & Co.

We have so often expressed our appreciation of this work that no more is needed here than to call attention to its successful completion. For the first time in many years we have a complete and handy reference book which is not out of date. Instead of publishing a collection of long and comprehensive treatises, such as constitute the Encyclopædia Britannica, the editors very wisely adopted the plan of more numerous subject headings and briefer articles. In this they have taken as a model the cyclopedias of Brockhaus and Meyer, and have nearly equaled the great German works, and to say this is very high praise indeed. We find two defects in the *New International;* one is the "grand stand play," as shown especially in large and showy plate illustrations where the many small illustrations in the text which they crowd out would be more useful. The second is that it is somewhat afflicted with atavism, and reproduces its ancestral traits too often. We frequently have occasion to compare it with our old "Chambers" of 1860 on the shelf above, and it is discouraging to find in a work which prides itself on its newness so many articles are substantially unchanged; sometimes whole sentences are identical. No doubt the statements are still true, but

The "Reliance." From the New International Encyclopedia. Dodd, Mead & Co.

a cyclopedia ought to be rewritten at least every half century.

Whistler As I Knew Him. By Mortimer Menpes. New York: The Macmillan Co. $10.00.

When reading Mortimer Menpes's delightful chat about Whistler, it is well to keep in mind that he has not attempted to write a life of the artist or a critical review of his work. He simply relates anecdotes of the man as he knew him; thereby throwing some light on the most eccentric, vain, quarrelsome, witty, sensitive, pure and lovable genius the modern world has known. Throughout the course of the book one may gather some idea of the methods of the great etcher, and catch a glimpse of the painter at work—a small dainty creature, using a polished table for a palette, and huge brushes, with which he achieved his exquisite effects. But it is the eccentricities of the man which claim our attention in these pages. Mr. Menpes fears, and justly, that the "Master's" "Gentle Art of Making Enemies" may be taken too seriously now that his delightful personality can no longer translate him. It was not because he hated men that he bit them with his acid sarcasm, but because it tickled his perverse humor to etch his fantastic caricatures on squealing human plates. Another whim of Whistler's was to do artistic cooking. This was something of a trial to his hungry guests, who did not always appreciate colored omelets or butter tinted an esthetic green to harmonize with the china. Delightful as these stories are we might obtain a warped idea of Whistler from them if there had been no personal acquaintance with which to modify their effect. No one who knew the "Master" in his family life or was entertained by him in his pleasant home at Paris could fail to love him or to forgive his whimsical outbursts of temper; and through all his odd conceits and petty vanities one felt the indomitable purpose of a man who was a "Master" and knew it. Much of the value of Mr. Menpes's book consists in its many reproductions of Whistler's etchings and paintings. It is impossible to do justice to his oil paintings by any mechanical process, but many of the etchings are beautiful, and the reproduction of some of the plates in their various stages of evolution is extremely interesting.

The Story of the Nazarene. By Noah K. Davis, Ph.D. New York: Fleming H. Revell Co. $1.75 net.

The Story of Our Lord's Life. By Mrs. Maud Montgomery. Simple Guides to Christian Knowledge Series. London: Longmans, Green & Co.

One would have thought that there was no room for another story of the life of Christ, but two lie before us. Dr. Noah K. Davis, Professor of Moral Philosophy in the University of Virginia, has arranged a Harmony of the Gospels, with incidental explanatory passages on the history and antiquities connected with it, so as to form a continuous narrative adapted for general reading. Mrs. Montgomery has written the story of the life of Jesus in simple language, with a view to its being used as a text book by young children. Both are very suitable for the purposes intended. Dr. Davis's book will be especially useful for those who do not care to study the more elaborate works of, say, Farrar and Geikie. Little, however, can be said of either book, which has not been said dozens of times about similar works, and, doubtless, many will find one or other adapted for private reading or religious teaching.

In the Red Hills. By Elliot Croyton McCants. New York: Doubleday, Page & Co. $1.50.

This is a better historical novel of the South than we usually get from that section. The scenes are laid in North Carolina immediately after the war. As usual, the family homestead is the pawn at stake. There is the same scamp money lender who plays the part of heavy villain in all these romances, the same spirited young Southerner, and the eternal courtly, elderly Southern gentleman, and behind every white man's chair the same obsequious negroes. In short, the usual characters and situations familiar to every reader of Southern fiction. But the author has vitalized his material with a wit and an artist's sense of form and literary finish.

A Dictionary of the Targumim, the Talmud, Babli and Yerushalmi, and the Midrashic Literature, Compiled by M. Jastrow Ph.D., Litt.D. Part XVI, pp. 1557-1736, xviii.

The lamented death of Dr. Jastrow occurred after he had completed this great work, altho he did not live to see the concluding part. This portion contains the larger part of the letter *shin* and *tav,* with an index of scriptural passages and an appendix of omitted words. For the first time, the scholar now has a rabbinical dictionary in the English language, and is now no longer compelled to depend upon Latin, German or Hebrew. It is a credit to American Hebrew scholarship, and will be of the greatest use to students. It is a great satisfaction that Dr. Jastrow has left behind him, as a successor in Oriental learning, a son who occupies a chair of Semitic languages in the University of Pennsylvania, and whose "Religion of Ancient Babylonia," the best work on the subject, is now being issued in translalation in Germany.

The Steps of Honor. By Basil King. New York: Harper & Bros. $1.50.

Mr. King has taken for his theme one of those questions of personal conscience and morality with which Mrs. Wharton delights to deal; but it goes without saying that Mr. King handles it much less subtly than Mrs. Wharton would do. There is no subtlety at all in "The Steps of Honor," but it is a warm, human book, with characters who think and talk and act like real people, and it shows, moreover, as this author's former books have shown, a just estimate on his part of human motives, a knowledge that motives, in the best and in the worst of us, are often curiously mixed. The plot, to put it briefly, has to do with an act of plagiarism committed by a young author who is an assistant professor at Harvard. If there is a weak point in the story, it is that it seems a little impossible that a clever man like Anthony Muir should make the mistake of putting forth as his own whole chapters from a book concerning which, tho it is old and forgotten, he has no assurance that other copies than his own do not exist. Still men have done as foolish things, and certainly the situation is developed in a very natural way. Muir's inner conviction that he never meant to deny the source of his material if questioned—his feeling, when he does deny it, that it was only the sudden accusation that surprised him into lying—the instinct, having once lied, to keep on lying—it is all exactly what a man of Muir's type would feel and do. Still he has courage; there is courage in the confession of his crime which he finally makes, even tho confession was in a manner inevitable, and there is courage in the use he makes afterward of his ruined life. Agatha Royal, Muir's promised wife, is well drawn, and, indeed, all the characters are lifelike. Best of all is old Professor Wollaston, with his delicious tactlessness, which, unconscious tho it seems, he can turn to adroit uses at need.

A Dictionary of the Bible. Dealing with its language, literature and contents, including the Biblical Theology. Edited by James Hastings, M.A., D.D., with the assistance of John A. Selbie, M A., D.D. Extra volume, containing articles, indexes and maps. Large 8vo, pp. xiii, 936. New York: Charles Scribner's Sons, $6.00.

Hastings's great Bible Dictionary in four volumes was completed only two years ago, and now the publishers have added a thick supplementary volume. Certain most important topics needed to be added, through the rapid advance of knowledge. The very discovery of the Code of Hammurabi requires thirty pages, entirely new, and already the subject of dozens of books and studies. Over fifty pages are given to the Religion of Babylonia, by the best living authority, Prof. Morris Jastrow, of Philadelphia. The road system of the lands of the Old and New Testament, by Professor Buhl and Professor Ramsay, occupies 40 pages of text and map. And here we are surprised by the statement that the first mention of Palmyra occurs just before the Christian Era. Does he deny that Tadmor is Palymra? The "Religion of Israel," by Professor Kautzsch, is a book by itself of 122 pages; and other long articles cover such subjects as the "Agrapha," "Apocryphal Gospels," "Papyri," "Semites" and "Textual Criticism." Two hundred pages are given to indexes, which are thus very

complete; but the articles in this extra volume are not arranged alphabetically—one must refer to the Index for them. This volume should be added to the library of all who have Hastings's Dictionary, and will be found of great value. We do not need to characterize it further, for the writers are of the best authority. We only mention further that much attention has been given to the earliest patristic sources, such as the Didache and the Diatessaron. The former is assigned to a period probably from 80 to 90 A. D., and is a source of extreme value in the history of the Christian Church.

Problems of the Present South. By Edgar Gardner Murphy. New York: The Macmillan Co.

Mr. Murphy, an able young Episcopal clergyman, of Southern birth and training, has for a year been in the service of the Southern Education Board. The present volume includes the results of faithful and honest study of what is called the Southern Problem. Mr. Murphy belongs to the school and thought of Dr. Curry, but has advanced beyond his predecessor. He takes the position of the more advanced Southern people, and wishes to give the negro all the training and culture and rights that he is capable of assimilating. His discussion will be instructive in the North as well as in the South, and will lead to a wise solution. We do not mean to say that he has, in our opinion, seen the history of the Reconstruction period quite in the dry light of a century hence, and he apparently forgets that there was not a Southern State in which the negro would have then been put in the saddle if the white men had not sulked and refused to ride, as they did in South Carolina, but did not in North Carolina or Georgia. Nor does he yet quite appreciate the wisdom of the way as well as the purpose of those Northern teachers who started the missionary schools in the South. But if he has not yet quite escaped the idea that it was social equality the North was after, he yet has prepared a volume of noble spirit, full of fact and wisdom. We especially commend what he has to say of child labor in the Southern factories and the complicity of Northern owners.

....THE KIND SHE WANTED.—*Mrs. Subbubs:* "When you go to look for a servant girl to-morrow try and get a 'public' one." *Mr. Subbubs:* "What do you mean by that?" *Mrs. Subbubs:* "Why, I read a paragraph about 'public servants' in to-day's paper and it said 'few die and none resign'"—*Philadelphia Press.*

....HAD A GOOD POSITION.—A young woman but recently married was the victim of a good joke on one of the uptown streets a few days since. She is extremely youthful looking and at the time—she was sweeping the sidewalk—she did not look to be over 15 years old. A fussy old lady came along and smiled sweetly on the young woman, and then said: "Lovely day, isn't it?" "Beautiful," was the reply. "Do you know where I could get a good girl?" "Not exactly, but there is an employment agency just above here." "Do you like your position here?" queried the old lady. "Pretty well," was the reply. "How many in the family?" "Only one besides me." "Who is he?" "He's my husband." "Good morning!" "Good morning!"—*Albany Journal.*

Editorials

The Nineteenth Decisive Battle of the World

It is as impossible to judge absolutely of the relative value of current events as it is to estimate the hights of mountains when one is among them, but there are certain events which stand out so prominently that we must regard them as of great importance, both in themselves and in their future consequences. Such is the defeat of the Russians at Liao-Yang last week. It seems to have been a definite and decisive test of fighting power. When in a war foreseen and prepared for by both parties for many years, two armies greater in numbers than ever before meet on a field of battle, equipped with all the destructive appliances of modern invention, led on both sides by their most competent and experienced commanders, it cannot be called a trick of chance if after six days of hard fighting one of them is routed.

It is useless this time for St. Petersburg to claim that it was a withdrawai and not a retreat. The excuse had some validity in regard to previous engagements of the war. The battles of the Yalu and of Wafang-Kao were, as compared with the battle of Liao-Yang, merely the driving in of outposts before a general engagement. Like the challenged party to a duel, General Kuropatkin had the selection of the ground, the weapons and the time for the combat. He had ample time to fortify his position; he had all the troops he could use, and all the supplies he needed.

If this should be followed by other and greater victories by the Japanese it will not lose its unique significance. If the fortunes of war should be reversed, and the Japanese be driven back across the Taitse River, and should lose or fail to take Port Arthur, still the work done in the last week in August, 1904, will never be undone. It is not too much to anticipate that future historians may say of it, as Hallam said of the victory of Charles Martel at Tours over the Saracens, that "it may justly be reckoned among those few battles of which a contrary event would have essentially varied the drama of the world in all its subsequent scenes."

It is upon this text that Professor Creasy based his "Fifteen Decisive Battles of the World," a little book which because it gave definitely and clearly—doubtless with somewhat deceptive definiteness and clearness—the turning points of the world's history, has become one of the most popular of historical classics. It is easy to find fault with his selection or with any other, and, indeed, to deny the possibility and utility of such a selection, but the original fifteen remain fixed in the common mind.

According to Creasy, the decisive battles of the world have been: Marathon, B. C. 490, when Greek civilization was preserved from an Asiatic inundation; the defeat of the Athenians at Syracuse, B. C. 413, by which Rome, instead of Greece, became the schoolmaster of Europe; the battle of Arbela, B. C. 331, which extended Greek influences from the Nile to the Caspian; the battle of the Metaurus, B. C. 207, which decided between Carthage and Rome; the victory of Arminius over the Roman legions under Varus, A. D. 9, which saved our Germanic ancestors from enslavement or extermination, and drew the line between the Latin and Teutonic races; the battle of Chalons, A. D. 451, when "the Scourge of God," Attila, and the Huns ceased their affliction of Christendom; the battle of Tours, A. D. 732, when, but for Charles the Hammer, the Koran would have been taught at Oxford instead of the Bible; the battle of Hastings, 1066, which "high-mettled the blood in our veins;" Joan of Arc's victory over the English at Orleans, 1429, by which she "rescued her country from becoming a second Ireland;" the defeat of the Spanish Armada, 1588, which checked the sea power of Spain and saved England from the Inquisition; the battle of Blenheim, 1704, when Germany was delivered from Louis XIV; the battle of Pultowa, 1709, when Peter the

Great brought Russia into Europe; the victory of the Americans, over Burgoyne at Saratoga, 1777, by which the New World was enabled to work out its own destinies; the battle of Valmy, 1792, which proved the power of the French Republic; the battle of Waterloo, 1815, which checked the attempt to found an empire for the aggrandizement of one man.

In the fifty years since Creasy counted the decisive battles of the world wars have not fallen in importance, and we can safely add three more to the list; the battle of Gettysburg, 1863, which decided the destiny of an enslaved race and secured for us all liberty and union, now and, as we hope, forever; the battle of Sedan, 1870, which marked the rise of the German Empire; the destruction of the Spanish fleet in Manila Bay, 1898, which made the United States the dominant power on the Pacific Ocean and marked its entrance into world politics.

To these shall we not now add the battle of Liao-Yang, the first time in the history of the world the yellow race has driven back the white; the first serious check in the conquest of Asia, Africa, and America by Europe; the first time an Asiatic race has demonstrated its ability to use the apliances of modern civilization; the first important battle for 1,200 years which was not fought on both sides by members of the Aryan race and professedly Christian nations; the first decisive engagement in a war for existence by a nation which is already exerting an influence on all others in commerce and industry, in art and science. If Japan finally wins she becomes the Great Britain of the East, and the natural leader of the Chinese and Koreans. If Japan loses, Liao-Yang marks the last desperate struggle of a non-Aryan race for independent existence, for no other seems ready to take her place.

We are not of those who shudder at the Yellow Peril. The earth is for those who make best use of it, and all we can do is to do what we can to make our own race the most worthy, realizing that if it is not, it will surely lose its place even tho all wars were henceforth abolished by a federation of the world. But war is becoming in modern times a fairer arbitrator for estimating the relative efficiency of nations, for nowadays victory is not so much as it used to be decided by mere numbers, or bloodthirstiness, or even by physical courage and material wealth, but rather by skill in organization, faithfulness in duties, honesty in contracts and in workmanship, thorough knowledge of science and skill in invention, the ability to subordinate the masses without destroying individual initiative and the power of working together for definite and long resolved aims. It is by these that the Japanese have conquered so far, and the coming on the world stage of a race so well equiped in these, the primal qualities of civilization, is not to be regarded as an irruption of barbarians.

A Uni-Personal Campaign

THE Presidential campaign, as yet only languidly opened, presents thus far only one serious issue, a personal one. And the personal issue concerns only one of the two principal candidates, Mr. Roosevelt. While personal, it is not one affecting in any way moral character. It is very different from the personal campaign of 1884, when both Mr. Blaine and Mr. Cleveland were bitterly attacked on moral grounds. Now but one of the candidates is personally attacked, and he not at all on any charge of moral taint. Fortunately both candidates are spotless in this respect.

Mr. Parker has lived a simple, quiet, blameless life; so has Mr. Roosevelt. Both of them present ideal examples of domestic relations. In the case of neither of them has any breath ever been whispered as to his integrity. They are scrupulously honest, and hate corruption in all its forms. No purer personal character could be presented to the people as examples to follow or lives to honor. And yet it is chiefly a personal campaign, not against Mr. Parker, but against Mr Roosevelt. It has to do with his traits, the web and woof of his nature. It cannot be such against Mr. Parker, for the world does not know him. He has been shielded too much by the quiet of long judicial duty and dignity to allow personal traits to be much known to the public. His position as a judge has

allowed no initiative, and has screened him from public gaze.

Not so is it with Mr. Roosevelt. He has been in the eye of the public since he was twenty-four years old. He has not avoided it; he could not avoid it, for his whole life has been devoted to the service of the public. He has from preference stood where he was doing something that the public must see. If his nature has virtues, they are evident; if it has weaknesses or faults, they are open to everybody's inspection and condemnation.

Now it is these traits, publicly exhibited, that the Democratic Party chiefly attacks, even more than his record as President. They say he is heady, reckless, ambitious, and that for this reason he is not a safe man to be elected President. There is no knowing, they tell us, into what mischief and dangers he might plunge us. This is their favorite weapon of attack. They are as silent as they can be decently as to every measure in their old platforms or the new; nothing about gold and silver, not a whisper of fiat money, very little about the Philippines or the Panama Canal, not much even about the trusts; but chiefly Roosevelt, because he is reckless and ambitious. They lampoon him as "Emperor."

Now what is there that is reckless, what sign is there of ambition, about Theodore Roosevelt? Does he put on any show, or special style of state or dignity? No one has accused him of being other than a straightforward man, quite simple and democratic in his tastes. Imperialism is none of his creating; the Spanish War began under President McKinley, and Roosevelt was simply Assistant Secretary of the Navy, doing what he could to get the fleet ready, until he left the office to be lieutenant-colonel of a regiment on the field. If that was reckless, so were thousands of soldiers reckless. His military record was creditable, and there was nothing in it more reckless than becomes a soldier.

Then Roosevelt became President, and was responsible for the Administration's conduct of the Philippine policy. Is there in it any touch of the reckless, the sensational, or the ambitious? There is about that policy just one salient pronounced feature—it has been swift to exchange military for civil government. It has often angered the army men, because it has put confidence in the Filipinos and given them a large and growing share in the government of the Islands. It has tried, just as fast as possible, to exchange external, colonial domination for self-government. Is that ambitious, is it reckless? Is it not both generous and wise? If that is reckless, then may Heaven grant us ever reckless Presidents!

Then there is his other great achievement, that of the assurance and control of the Panama Canal. It was no easy task to secure and accomplish it, and it was a great honor to the administration and a great blessing to the country and the world, but was it a reckless act, anything that savors of blameworthy ambition? Indeed, the world knows that it showed both patriotism and statesmanship.

Where, then, does this recklessness show itself? Was it in sending an army to deliver the foreigners shut up in Pekin? No one will say it; we did no more than every other civilized nation did. The world applauds the part which the United States took in that campaign. Was it when he asked the parties of the coal strike to submit their case to arbitration? The country approved then and approves now What, then, is the evidence in the acts of the President that he is personally of a reckless, ambitious nature, so much so that it would be dangerous to elect him again, for fear that he would plunge us into war or some other horrible complication? There is simply no such evidence at all.

What, then, is at the bottom of this personal campaign? What is it that they see in President Roosevelt that is the basis of the charge? Nothing but this, that he is given to doing things. He has a sense of what ought to be done, and he tries, in legal and Constitutional ways to have it done. His is not the mere judicial mind which weighs and ponders and does nothing. He has been in the habit all his days of doing things. He is a man of unusual vigor, physical and mental, and he always wants something useful to be accomplished. That is a dangerous trait, if a man be a fool; but it is the trait which characterizes all useful and successful men. Add it to good

common sense, good ability, and good purposes, and we have a man for the people to admire, trust and follow. Such a man is Theodore Roosevelt.

We must not omit one single evidence to the charge that Roosevelt is impetuous and wilful; it is that he has on three occasions treated negroes like white people. This we cannot deny. Once, when conferring with Dr. Washington, lunch was brought in to him, and he asked his visitor to take lunch with him. Again, he insisted on appointing a colored man as Collector in a second-rate Altantic port; and once he closed a little post office because the people would not allow a colored woman to remain in charge of it. It is of no use for us to try to show the absurdity of this objection to those who make it. Not long ago, in Savannah, there was a civil suit between two white men. A colored man was called as witness to testify as to the character of one of the parties. The lawyer began to address him, "Mr. Jones," when he was interrupted by the Recorder: "Stop, there! I will fine any lawyer for contempt of court who addresses a negro as 'Mr.' in this court." The lawyer corrected himself: "Jones, do you know this defendant?" "I do." "What is his character?" "It is good." "How do you know about him?" "He has worked for me for three years." Naturally, to those who cannot persuade themselves to call Booker T. Washington *Mr.*, the President is an impulsive, wilful, dangerous man. We should expect that view of him presented by Senator Gorman and his henchmen in Maryland.

Mr. Roosevelt is a man of executive quality, a man who does things, who has the initiative of statesmanship, with whom, as our President, we can be sure that the interests of the country will not be neglected; a man of high purpose and sound judgment. To make a personal campaign against him is gnawing a file.

A Free Church

The French Republic and the American Republic both adopted, at about the same time, the policy of separation of Church and State. The American Republic has maintained and perfected it, notwithstanding some opposition. The French Republic perished, and with it the independence of the Church. The conditions were different. In this country we had a people that believed in religion, even when they would not have the State responsible for it; but in France the Republic was atheistic; and, when it went, the Empire would have none of its divorce from religion. Then came the Concordat under Napoleon, already an Emperor, if called a Consul.

So for seventy years under Emperor or King, and thirty years under a new Republic, France has held that the State must support and control the Church. So it has been in all Europe. The Pope has declared, in a Syllabus of Errors, that the separation of Church and State is a wrong to be condemned, and that Syllabus is perhaps the only utterance of a Pope which can yet claim to be infallible under the new definition. The condition in America is strictly condemned, and that in France and Italy approved.

But now we see a rapid change of sentiment abroad toward the rule which prevails in our own country. It has proved safe here for religion, no matter for what Church, and particularly so for the Church which condemns it. While England holds to an Established Church, not one of her colonies has accepted it; every one, Canada, Australia, South Africa, prefers the example of the United States, and the Churches prosper under it and are contented. Even Ireland has ceased to have an Establishment, and the Church which has there lost the support of the State is all the happier for the change. The fact is that wherever the Church walks alone, it proves, *probat ambulando*, that religious liberty is truer than the Syllabus. And now the contest of Voluntaryism and Establishment is coming to near battle in both England and France, two countries that are now seriously considering whether it is safe for them to do what Japan has not hesitated to achieve. The extraordinary injustice of the decision of the House of Lords as to the right of the Free Church to exchange the principle of Establishment for Voluntaryism is greatly helping the principle of the Free Churches in England. Disestablishment is to enter seriously into the next Parliamentary campaign, and within the Established

Church itself are many who desire the change which will give freedom and self-government to the Church. At the late Devonport bye-election three High Church curates worked hard for the Liberal candidate, because they are in favor of the disestablishment of the Church. Even the brewers, who have been the warmest defenders of the Established Church, under the oft repeated watchword of "Beer and Bibles," are now beginning to turn their contributions from the Bishop of London's Fund to the fund of the Liberation Society, in anger because the Bishops have opposed the act for the compensation of those whose public houses are closed. Probably a majority of the English voters are Nonconformists, and the majority of the Liberal members in the next Parliament, which they are sure to rule, will be in favor of disestablishment.

And the same movement is going rapidly on in France. Six months may see the Concordat denounced and abolished. The Pope does not seem to care, notwithstanding the Syllabus of his predecessor of the same name. At any rate, he will yield nothing of his claims in the rule of the Church, to save the Concordat. And last Sunday, in an address at a municipal banquet, Premier Combes declared that the Republic means to free France from all dependence as regards religious power. He declared that no new Concordat is possible, but there must be religious liberty and social peace. That means that the die is cast, the Concordat must go; Church and State must be absolutely independent. We only hope that when the French Republic frees itself from all bonds with the Church, it will leave the Church to go on its own way, and will not try to prevent its free exercise of its liberty to teach and preach, under the conditions of loyalty and good order.

The Masses and Classes in the Philippines

THE great gulf between the upper class and the masses in the Philippines is the most striking social feature of the Islands. It is a far greater obstacle to the existence of a real Filipino nationality than the more superficial distinctions between tribes. Caciquism, or local bossism, in the form which it there assumes, is a much more serious difficulty in the way of the successful working of the self-government idea as introduced under American rule than is the lingering resentment against the Americans as rulers. The old *régime* maintained—indeed built its structure of government and religious dominion over—this abyss between the upper and lower classes, and it was only toward the close of Spanish rule that the growth of industry and commerce and the spread of somewhat better education began the tremendous task of filling up the abyss. To the very last the Filipinos of education and property remained a class set apart, a class composed, only too often, of sycophants of the Spaniards, who sought to identify themselves rather with the ruling whites than with the more pure-blooded native element. This condition, of course, in a great measure survives to-day, maintained by the ignorance of the masses which it is hoped to reach with the American primary schools.

It is interesting to find evidences here and there of sympathy on the part of the upper-class Filipino with his kindred of the masses. In general, it is one of the most surprising things to the American to find how thoroughly the educated Filipinos, including quite commonly those who fought for and still maintain sympathy with the so-called Filipino revolution, despise their humbler brothers. It is one of the rarest things in the world to find a Filipino of the upper class who really identifies himself in feeling or interest with the masses of his countrymen. The same man who in public protests against his people being called ignorant or unfit for any form of self-government the world ever saw (or a compound of all of them) will in private relate to you instances showing the utter credulity, fanaticism and lack of independent feeling on the part of the Filipino laboring classes.

A Filipino who, under the signature of "T. K.," hides the name of a prominent revolutionist, has recently published in the columns of *El Renacimiento* of Manila a study of the "Filipino rural class," which deserves attention both as the frank expression of a well-informed Filipino on the actual state of the masses

and because it is also evidence of a sympathetic interest on the part of such a Filipino in the lower classes. It is not less significant that it finds publication in *El Renacimiento* almost immediately after that newspaper indulged in a vigorous protest against the statement made by Secretary Taft in Chicago that 90 per cent. of the people of the Philippines are ignorant and incapable of understanding at present the workings of any sort of self-government.

The writer says the typical Filipino is the agricultural laborer of the provinces, because of his overwhelming predominance in numbers, despite the tendency at present to flock to the cities for labor, on account of agricultural depression. With some omissions of less significant portions, he continues, quite literally translated, as follows:

"Our class of field-laborers is composed of individuals of a high type of morality, simple and straightforward for the most part, intelligent so far as the labors of the field are concerned, not intelligent for other things (may this last assertion prove to be erroneous!), and with an adoration of God of the purest sort in some, fanatic in others. For them life is a declivity which has abysses, but no ascents—they never think of climbing higher, poor fellows! For them it is an extraordinary thing to attend the public festivals, to go into the municipal building, see the president or some other important personage (whom they salute with a servile bow and reverent inclination of the body), and even to go to the town or to mass. They are not concerned in the slightest degree over the form of government, more or less democratic, more or less representative in character, whether of the one or of the other rule, nor over the character of the people who are in rule.

"The ideal of this class is limited solely to possessing each one a beast of burden, a piece of ground to cultivate, and, at the proper time of year, a sufficient quantity of seed (rice, corn, etc.). 'Possess,' no; that is a mistake: draft-animals, land, and, at times, the seed itself, do not belong to the poor laborer, but to the proprietor or capitalist, the possessions and profits of the laborer being reduced merely to a part of what is produced, which in the majority of cases does not cover the needs of the family till the next crop. Yet, with all this, do you suppose that the laboring class will turn its attention to other ways of subsistence of a more advantageous sort? Not at all; and if, for instance, there is any sowing of new seed, or improvement of the soil, it will be due to the proprietor. I have known cases where methods of betterment, proposed by the latter, were rejected by the laborer, who would benefit by them. You may point out to the latter how he could obtain better land by moving upon some tract of virgin and unoccupied soil; but he will almost surely answer you that he cannot give up the sacrifices he has made on the soil he now occupies, even tho he admits it is poorer than that which he might occupy. For the progress of agriculture in our country there are needed not merely new methods of cultivation and new tools, but a radical change of habits and customs, the suppression of certain ways of thought and belief.

"Such a social class as this, with the character and obsessions that have been indicated, cannot, in any degree, be considered as a factor that can make itself felt in the present evolution of our forces. If there were no class capable of being enslaved, the cacique would not be set up as a god, nor would there be this servile submission to the authorities and to all men in uniforms. If you want to start a tremendous hullabaloo in a *barrio* [group of houses distant from the center of population] send in a couple of constables or local policemen; if they come at any time in the night, immediately all the male inhabitants will flee into the woods, not showing up until the following morning, when the 'disturbers of public order' have returned to town; if they come by day, the laborers overtaken in the fields will leave their work to hide themselves until 'the danger' is over. As for the civil authorities, it is well known that there are *barrios* which receive their representatives in the municipal council as if they were the Czar.

"Generally speaking, in every *barrio* there are, to make the semi-slavery more evident, one or two petty caciques

[*caciquillos*] whose mandates are blindly obeyed. They maintain relations with ladrones, highwaymen and such bands. An animal is stolen, for instance, the owner knows very well there is no way of getting it back but by asking assistance from the *caciquillo.* If the authorities, or a private individual, want twenty or thirty men for a piece of work, the only way is to get them through this petty lord. The latter will sometimes play the *rôle* of judge, deciding small disputes, quarrels, and even settling civil questions, such as the division of property, etc.

"In all things judicial, the lower class finds it a thousand times preferable to keep silent, to conceal and to let go undenounced a punishable offense, or a brutal abuse, than to denounce it to the courts of justice for its proper punishment or to make it possible for the witnesses of the fact to clear up the matter in the interest of truth and justice. The causes of this most lamentable phenomenon are three deep-seated, long-existent obsessions among the people: for the countrymen, every attempt at prosecution of a crime is useless, because—too bitterly true many times—justice is always on the side of the cacique, or those he protects, on the side of the strongest or the richest; the second obsession is that even should victory be on the side of the poor, he will be subject to the cacique's vengeance, the war of grudges and abuses, which is sure to follow, always ending with the ruin of the weak man; and the third obsession is that it is better to suffer and submit to injury than to borrow money of the rich to spend in the suit, which will last years and years, even a lifetime, as happened in the former *régime* under its inquisitorial judicial system. How often now the prosecuting officers have to regret their lack of the substantial witnesses, because the latter fear vengeance that would follow or are entirely convinced that justice would not triumph anyway!

"In regard to education, it is not worth talking about in connection with our working class, the majority of which have not even seen the doors of a real school. Until but a short time ago, and even now [in the *barrios* not yet reached by the new educational system], the formula that was laid down for the children, after learning their alphabet, was that of learning by memory, like a parrot, the entire *Misteriong tagalog,* a booklet which is in real truth a 'mystery' for the children, who do not understand it, especially since the only object for them is to commit it to memory. The schools that the municipalities propose to construct in the *barrios* have only been established in the *barrios* close to the center of population, with the result that precisely those who most need them are left fasting from the benefits of instruction.

"Furthermore, the present method of education encounters, in our mothers of family, firmly addicted to the ancient practices, an element openly refractory. Of course, this is so: in accordance with the new system of the separation of Public Instruction and Religion our teachers do not now include Christian Doctrine in their lists of study. This is, to the mothers, a sacrilege, a school of atheism. Before all else, say they, one must know Christian Doctrine, in order to be able to confess. Confession, they think, is the first step, the first condition, for forming the man."

Some of the greatest difficulties with which the present administration of affairs in the Philippines has to deal will have been made more vivid to those who have not been in the islands by the above essay from the pen of a Filipino.

The Victory of Liao-Yang

Step by step, by steady advance, the Japanese move forward and the Russians retreat. So sure has been this advance, so exact has been the Japanese science of war, that, now they have captured Liao-Yang, we cannot doubt that good weather will see them pushing relentlessly on in a few weeks to Mukden, the capital of Manchuria and the seat of the tombs of the ancestors of the Chinese Emperors. That will be a splendid success for one campaign, even if Port Arthur remains invested and not yet taken by assault or starvation. But beyond is Kirin, and the main railroad line

to Vladivostok, and not till that is reached can Japan claim a complete and conclusive conquest over her foe. Then she can make claim to hold what she has taken, and to demand the great Island of Saghalien, which commands Vladivostok, and the whole coast south of the Amûr River. Such will be a fair conclusion of peace, if science and courage play the part in the months to follow that they have in the past. Russia ceases to despise her pygmy foe. She talks no more of imposing terms of peace in Tokyo. She no more declares that Orientals can make a sudden dash, but have no persistent courage. Her fleet is gone, and under no conceivable circumstances is it possible for her to threaten the coast of Japan. She can only resist and fall back, and make peace and then learn the game of war, having first learned how to rule her own people and teach honesty to her rulers and officers. It does not seem possible to discover any way by which Russia can recover her prestige or be successful in this war, even if it is prolonged for years; for certainly Japan will not think of repeating Napoleon's mistake when he went to Moscow.

The Resurrection of Major Glenn

Major Glenn, we heard of him a year ago, and had forgotten him, until Mr. Bryan, in his journal, picks up an old copy of a Manila paper with the account of an address made by Major Glenn at a reception given him by an Army post just as he was leaving the Islands. The doughty Major scored the policy of the Philippines for the Filipinos, and bitterly he criticised the policy which was turning the Government over from the army to civil authority. Then he quoted these lines from a soldier poem, "The Little Brown Brothers:"

"I'm only a common soldier man in the blasted Philippines.
They say I've got brown brothers here, but I dunno what it means.
I like the word fraternity, but still I draw the line—
He may be a brother of William H. Taft, but he ain't no friend of mine."

And Major Glenn neither acted nor talked as if he were the friend of the Filipino. That was a year ago and some history has been made since then, and the civil rule has proved a success and is pacifying the native people, as regiments of Major Glenns never could have done.

A Lynching at Laramie

A crime still more inexcusable than most of the lynchings in the South occurred at Laramie, Wyo., where a mob violated the jail and, taking out a prisoner who had cut the cheek of a girl with a razor, hanged him on a lamp post in front of the home of the district judge. A crowd of men, women and children, laughing and talking as tho they were at a circus, witnessed the deed. Through the negligence or cowardice of Sheriff Cook the leaders of the mob were enabled to possess themselves of the keys without any opposition or difficulty. Wyoming used to have sheriffs who could shoot, and it is a pity that the race is extinct, otherwise Laramie would have been relieved of a few of the 200 midnight murderers who live there. Nothing is likely to be done by the county attorney toward prosecuting the leaders of the mob.

A German Dream

A very curious report is that which a St. Petersburg correspondent sends to London, that the Emperor William has been cautiously sounding the Czar's advisers as to terms of peace, on the basis of an alliance between Russia, Germany and Japan, to supplant the Anglo-Japanese alliance. The hope is that such an alliance would shape the destinies of Europe and Asia, and shut out Great Britain and the United States. So it might, and also all the Latin nations. It is a high diplomacy that is well in the air. Doubtless Russia has milked France pretty completely, and is now ready to squeeze the German pocket, and so has little further use for France, which, indeed, has little further need for Russia. But how does Japan come in? Will Japan be ready to give a beaten enemy the fruits of victory, by allowing her a share in the control of the destinies of Asia as well as of Europe? We may be sure that Japan will care more for a close alli-

ance with China than with any European Power, and that she will find it more to her interest to be on good terms with Great Britain and the United States than with Germany. Next to Russia Germany has been Japan's worst enemy. It was these two Powers that shut her out of the fruits of her victory in the war with China. Japan could never trust those two Powers. We may be sure that such a dream cannot be accomplished.

Atomic Synthesis by Radium?

Sir William Ramsay reports an interesting experiment in which it appears that the radiation from a radium salt is able to convert ordinary matter into radio-active substances. Glass bulbs containing a tenth of a gram of radium bromide dissolved in water were kept for six months in small beakers, which became discolored by the action of the radiation and were found to be radio-active on the inside and outside. The radio-active substance formed on the surface could be washed off, and the water then contained in solution various radio-active substances, which, on bubbling air through the solution, gave off the usual emanation of a heavy, condensible gas, and were carried down with different precipitates. It was sufficiently startling to be told by Rutherford and Soddy that the radium atom was breaking down into elements of lower atomic weight, ultimately helium, but it seems from this experiment that the tremendous amount of energy liberated by this disintegration of the radium atom is capable of effecting the reverse transformation on a small amount of other matter, possibly by building up unstable atoms of high atomic weight from simple elements.

A New Roman Canon

Under date of August 20th, *Le Matin* of Paris has a special telegram from its Roman correspondent. It states that Mgr. Le Nordez, the vanished Bishop of Dijon, will soon be named a Canon of a Roman Basilica. This outcome is due chiefly to the efforts of the Superior General of the Trappists. When brought before the Holy Office, Le Nordez, so the French newspapers say, was accused of none of the charges which filled the air in the Burgundian capital, particularly Free Masonry. Instead, he had to face an old budget of crimes, which his former Bishop had alleged against him, when Auxiliary-Bishop. These were new and unknown; Rome had pigeon-holed them, had appointed the accused Bishop of Dijon and now, in the nick of time, rediscovers them. Why so? A plausible reason seems to be that in trying *l'Affaire Le Nordez* on the old list and not on the new the Holy Office would not seem to run foul of the Concordat. Whatever Le Nordez thought of the old charges, probably quite unknown to him heretofore, he learned that Rome gave no heed to the new. Now he is about to become a Canon, an old method of interning the accused. The removal of Bishop Keane as Rector of the Catholic University is a similar case. Cardinal Satolli charged him with Pelagianism. Keane was removed and ordered to Rome. Thitherward he went, was named Canon Subdeacon of St. John Lateran—the lowest grade of Canonry, at a salary of, we believe, four hundred lire a year (about eighty dollars), and was after a while named Archbishop of Dubuque. But up to the present moment Archbishop Keane has never faced a trial and never will. Is Le Nordez a Free Mason? Is Keane a Pelagian? The Holy Office answers not.

Judge Parker, in his speech of acceptance, made some statements that deserve serious attention. He was speaking of the three co-ordinate departments of Government, and he declared that each had been guilty of usurping the authority of others." Thus "in the course of our history Executives have employed powers not belonging to them." Of the Legislative he said: "Statutes have been passed that were expressly forbidden by the Constitution." One might say that if these things are true the Judiciary would set them right, but Judge Parker continues:

> "Statutes have been set aside as unconstitutional when it was difficult to point out the provisions said to be offended against in their enactment."

This is a very serious charge against our Supreme Court, from a Chief Justice, and it would be interesting to have particulars.

It is a pleasure now to see that our Metropolitan Museum is able to make large purchases out of its new fund. Just now there has been put on exhibition the Duc de Dino's magnificent collection of armor bought at the expense of a quarter of a million dollars. It is a noble collection, with full suits of armor, the choicest work of medieval armorers of France, Germany and Italy. Many of the pieces are very richly engraved, etched and gilded in beautiful designs. On the shields are great dragons or scenes of combat most elaborately designed, worthy of the arms which Vulcan made for Achilles. There are swords, scabbards, arquebuses, halberts, every variety of weapon or crest used in knight errantry, wrought in steel, gold and ivory. Such a grand purchase will not prevent private gifts, as is shown by the unparalleld collection of jade, bequeathed by Mr. Heber R. Bishop, which fills a neighboring room in the new portion of the Museum.

It was in Saluda County, S. C., that Judge Watts lately sentenced a man convicted of murder. It was a most deliberate murder, and the murderer, a man of position and property, took his son of eighteen with a pistol to take part in the killing. The witnesses were terrorized and unwilling to testify, but the case was clear, and yet the jury recommended him to mercy, and the judge sentenced him to prison for life, and hoped the sentence would make life safer in Saluda County. It needs the protection of law, for the judge in passing sentence said that the solicitor of the Sixth District had said that he was actually afraid to blow his nose in the Court House, because he carried his handkerchief in his hip pocket, and was afraid somebody might make that an excuse to shoot him. Such is one of the local phases of civilization.

Dr. P. T. Forsyth, one of the most distinguished Congregational clergymen in England, in discussing the decision of the House of Lords on the Free Church matter, says:

"It delivers a severe blow to the cause of reasonable religion everywhere. It is an immense access to the forces of religious reaction and obscurantism. This will be especially the case in the Presbyterian Church. . . . In the United States and Canada, where Orthodoxy has still such an advantage over scientific theology, the effect must be lamentable."

He is greatly mistaken. It will not in the least affect any Presbyterian or other Church. We look on it simply as an absurdity and an outrage, and will pay no attention to it beyond commiserating the parties that must submit to that kind of law.

Like other Christian Churches, the Greek Church has a journal in Japan with a name that conveys no meaning to the English ear. But we do appreciate what it says as to the freedom which the Greek Church enjoys in Japan, as compared with its conditions even in Russia. It says that religion fares better when free from State control and interference; that there is no comparison between the freedom enjoyed by a Christian minister belonging to the Greek Church in Japan and a Russian priest residing in Russia. Think of it, that priests of the Russian Church are better off in Japan, in time of war, than they are in Russia in time of peace.

Ex-Senator David B. Hill has lately asserted in a public speech in Binghamton that when Mr. Roosevelt took the oath of office at Buffalo, immediately after the assassination of Mr. McKinley, he "declared in public that he would simply fill McKinley's place, that he would not look for renomination;" and he characterized Mr. Roosevelt as a "fraud" for breaking his word. It has been testified to by those then present that Mr. Roosevelt said no such thing, as he had no occasion to say it, when the only proper thought was of the loss of the terrible tragedy.

Every retreat of Kuropatkin's has been a "withdrawal" to his "main position," for "strategic" reasons. How many "main positions" has he?

Insurance

Municipal Electric Fire Alarm and Police Patrol Systems

S. N. D. North, Director of the Bureau of the Census, in Bulletin No. 11, lately issued, considers municipal electric fire alarm and police patrol systems. This bulletin is one of a series dealing with the generation and utilization of the electric current. Mr. North includes in his present report the statistics of 764 systems, which were practically all which were in use in this country up to the end of December, 1902. A considerable percentage of the fire alarm systems (nearly 50 per cent., in point of fact) were under the direction of administrative bodies, including boards of aldermen, boards of selectmen, city councils, boards of burgesses, trustees, etc. In some cases, particularly in the larger cities, an officer or officers appointed by the Mayor replaced boards elected by the people. There is a growing tendency, according to Mr. North, to intrust the supervision of the fire alarm and police patrol systems, as well as of other electrical functions, to a department of electricity. In the 764 systems described there was an aggregate of 2,798 miles of pole line owned and 10,952 leased, with a total wire mileage of 28,202 miles, consisting of 27,721 miles of single wire and 481 miles of wire in cables, engaged in the receipt and distribution of fire alarms. The practice of putting wires used for such purposes underground has, it appears, rapidly increased within recent years. In certain cities, notably in Milwaukee, the use of the telephone at one time obtained considerable favor as an adjunct to the regular system of transmitting fire alarms, but its popularity is now diminishing under discouragement instigated by the chief of police in that city, because of the length of time required to notify the fire headquarters by telephone. Out of 38 cities having a population of 100,000 or over only two—viz., Kansas City and St. Joseph, Mo.—had no systems of electric fire alarm.

The total number of signaling and annunciating boxes in the United States is given as being 37,832, from which 85,070 alarms were received. Of these alarms 12,794 are credited to New York, from 5,594 boxes, or 2 per box per annum, whereas in Illinois, with 2,578 boxes, the number or alarms received was 9,027, or 4 per box. In Massachusetts, with 4,890 boxes, 9,491 alarms were received, or 2 per box. In the State of Pennsylvania, with 3,566 boxes, 4,571 alarms were reported as having been received, or about 1.3 per box. In Kentucky, with 603 boxes, 1,864 alarms were reported, or 3 per box. In Minnesota, with 838 boxes, 2,430 fire alarms were reported, or 3 per box. The variations in the average number of fire alarms per box may be due either to the prevalence of wooden construction in buildings, resulting in more frequent fire alarms, or to the heavy duties thrown upon the boxes by distributing them more sparcely. This latter supposition appears, however, to be but ill supported in actual experience.

The report from which these details are extracted contains likewise a very interesting historical and descriptive account of the development of the use of electricity in its application to fire alarm signaling.

Not daunted by the unfortunate experience of Iowa, Minnesota and Wisconsin along the same line, Louisiana will try the experiment of carrying its own fire insurance. It looks very much like tempting Providence, but *The Chronicle* is authority for the statement that instructions have been given not to renew expiring policies upon State properties. In case no loss occurs Louisiana stands to save $20,000 a year in premiums, but in the case of fire the opportunities for lament will be absolutely boundless.

....Dividends announced:

Louisiana & Arkansas R'way (1st Mort. 5's) Coupon No. 4, payable September 1st.

Amer. Chicle Co. (Preferred) 1½ per cent., payable October 1st.

Amer. Chicle Co. (Common) 1 per cent., payable September 20th.

Financial

The New Banking House of Harvey Fisk & Sons

THE well known banking house of Harvey Fisk & Sons have just moved into their new building, 62-64 Cedar Street, an illustration of which appears in THE INDEPENDENT. This house was established nearly forty-five years ago under the name of Fisk & Hatch, the partners being Harvey Fisk and A. S. Hatch. During the Civil War Government bonds were sold by Fisk & Hatch in small and large quantities all over the United States, except in the South. Pliny Fisk, Wilbur C. Fisk, Charles J. Fisk and Alexander G. Fisk are the four sons of Harvey Fisk, who are now interested in the business. Other partners are Theodore H. Banks, H. L. Denny, R. H. Higgins and Albert A. Tilney. The firm of Harvey Fisk & Sons deals almost exclusively in Government bonds and in high grade investment securities.

....Sales of over 100,000 pieces of cloth for last week reported from Fall River give some indication of an increased demand in this market.

....The withdrawals of cash from the banks by persons who left the city for the September outings is variously estimated at from $4,000,000 to $10,000,000.

....The Central cotton mills of Sylacauga, Ala., have just passed into the control of the Avondale mills of Birmingham, Ala. The new management will expend $100,000 in the betterment of the property; 11,200 spindles will be added to the mills' equipment.

....Efforts made at the last monthly meeting of the Western Passenger Association, held at Chicago on September 1st, to bring about a combination between the Southwestern Bureau and the Western Passenger Association, resulted ineffectually. The consolidation was favored only by the Santa Fé & Rock Island Railroad, whose lines are in both territories.

The Independent

Vol. LVII NEW YORK, THURSDAY, SEPTEMBER 15, 1904 No. 2911

Survey of the World

Roosevelt's Letter of Acceptance

In his letter to J. G. Cannon, chairman of the Notification Committee, dated Oyster Bay, N. Y., September 12, 1904, the President accepts the nomination of the Republican Party and discusses at some length the attacks which have been made on the policies of the Administration, beginning with these words:

"It is difficult to find out from the utterances of our opponents what are the real issues upon which they propose to wage this campaign. It is not unfair to say that, having abandoned most of the principles upon which they have insisted during the last eight years, they now seem at a loss, both as to what it is that they really believe, and as to how firmly they shall assert their belief in anything. In fact, it is doubtful if they venture resolutely to press a single issue; as soon as they raise one they shrink from it and seek to explain it away. Such an attitude is the probably inevitable result of the effort to improvise convictions; for when thus improvised, it is natural that they should be held in a tentative manner."

On the other hand, he says, the party now in control of the Government have a clear and determined policy which they have expressed in actions as well as words. "Men may differ from us, but they cannot accuse us of shiftiness and insincerity." The party has not only proved equal to such tasks as were anticipated in the campaign, but has showed the same efficiency in dealing with such unexpected crises as the Spanish War and the Isthmian Canal question.

"Had not Panama been promptly recognized and the transit across the Isthmus kept open, in accordance with our treaty rights and obligations, there would have ensued endless guerrilla warfare and possibly foreign complications, while all chance of building the canal would have been deferred, certainly for years, perhaps for a generation or more. Criticism of the action in this matter is simply criticism of the only possible action which could have secured the building of the canal, as well as the peace and quiet which we were, by treaty, bound to preserve along the line of transit across the Isthmus. The service rendered this country in securing the perpetual right to construct, maintain, operate and defend the canal was so great that our opponents do not venture to raise the issue in straightforward fashion, for if so raised there would be no issue."

He complains that his opponents denounce in general terms the foreign policy of the Government without stating definitely to what features of it they object and in what way they would act otherwise. He asks whether they object to the presentation of the petition of American citizens against the Kishinef massacres, or to the protest against the treatment of the Jews in Rumania, or Armenians in Turkey, or to strengthening of The Hague tribunal; or to the settlement of the Alaska boundary line; or to reciprocity to Cuba, or to the acquisition of Hawaii and Porto Rico; or the peaceful settlement of the Venezuela troubles; or to defense of our citizens and representatives in Turkey and Morocco; or to the trade treaty with China. Mr. Roosevelt then speaks of the inestimable service rendered to all mankind by the men who fought for Union and liberty in the Civil War, and defends his action in directing that the fact that a man has reached the age of sixty-two should be considered presumptive evidence that his capacity to earn a livelihood by manual labor has decreased one-half, which entitles him to a pension of $6 a month under the dependent pension law. Will

the opposing party announce now that this executive order will be reversed if they come into power? The action of the Attorney-General in enforcing the anti-trust and commerce laws and of the last Congress in enlarging the scope of the interstate commerce law and establishing a Department of Commerce and Labor have for the first time opened a chance for the national Government to deal with the questions arising from great aggregations of capital. It is asserted "that the common law, as developed, affords a complete legal remedy against monopoly;" but there is no common law of the United States. No Federal court or officer could take any action whatever under its rules. As for the permanency of the gold standard:

"It is idle to say that the monetary standard of the nation is irrevocably fixed, so long as the party which at the last election cast approximately 46 per cent. of the total vote refuses to put in its platform any statement that the question is settled. A determination to remain silent cannot be accepted as equivalent to a recantation."

In regard to the tariff question he inquires whether the people are expected to believe the Democratic platform that "Protection is robbery," or those leaders of the party who state that they have no intention of disturbing existing schedules. To abolish the tariff would mean commercial ruin. If a protective tariff is "unconstitutional," as declared by previous platform, or "robbery," as by the present, it is equally so when revised or lowered. No reciprocity is possible without the tariff.

"It is but ten years since the last attempt was made, by means of lowering the tariff, to prevent some people from prospering too much. The attempt was entirely successful. The tariff law of that year was among the causes which in that year and for some time afterward effectually prevented anybody from prospering too much, and labor from prospering at all. Undoubtedly it would be possible at the present time to prevent any of the trusts from remaining prosperous by the simple expedient of making such a sweeping change in the tariff as to paralyze the industries of the country."

Mr. Roosevelt discusses at some length the relation between agriculture and manufacture and the way in which both are benefited by protection. As to the charge of militarism he shows that the army is smaller in ratio to the population than it was in the time of Washington and Jefferson. There is now one soldier to every 1,400 people—less than one-tenth of one per cent. In reply to the statement that the Government is extravagant and has converted "a surplus of $80,000,000 in 1900" to "a deficit of more than $40,000,000" in the year just closed, he says that the deficit is imaginary, obtained by including in the ordinary current expenses the $50,000,000 paid for the right of way of the Panama Canal. The diminution in the surplus was brought about designedly by the abolition of the war taxes. The reduction in taxation has been considerably greater than the reduction in the annual surplus. The comparatively slight increase in expenditures is due to new forms of public work, such as rural free delivery, meat inspection and irrigation. In regard to the Filipinos it would be unsafe to promise them independence, because they would expect it immediately, and instead of endeavoring to fit themselves for moral and material advancement, they would abandon all effort at progress and begin factional intrigues for future power. Anarchy and civil war would follow if we adopted "the policy of scuttle."

Parker Speaks to Editors

Several hundred editors of Democratic papers were brought to New York and given a banquet at the Waldorf-Astoria at the expense of the National Committee, September 7th, and on the following day paid a visit to Esopus, where Judge Parker made to them the second speech of the campaign. At the banquet the important toast was that given by Henry Watterson on "The Issue and the Outlook," chiefly devoted to an attack upon the President, of whom he said:

"For the life of me I cannot see how any self-respecting Mugwump can vote for Roosevelt, the recreant Civil Service Reformer, nor how any intelligent German, much as the President resembles the Kaiser, can be willing to take even a lottery chance in a war with the mother country precipitated upon the drop of a hat to glorify the administration."

In his address to the editors Judge Parker laid stress upon the importance of the press as a leader of public opin-

ion, and deprecated internal strife on minor points of difference between members of the same party, "which is concededly united on every vital article of faith which can reasonably enter into the pending canvass." "The exercise of ordinary prudence forbids the alienation of allies who are willing and anxious to assist." He charged the Republican administration with "reckless extravagance and waste of the people's money:"

"During Mr. Cleveland's first term the average annual expenditure was about $269,000,000. For the past three years it has been about $519,000,000.

"The Governmental expenditure last year mounted up to $582,000,000, which is not equaled by any year since the Civil War, with the exception of the year of the Spanish War.

"There is an inevitable result to such extravagance. Instead of a surplus in the annual receipts of about $80,000,000, which the present Executive found on assuming control, there is now a deficit to be found there of $42,000,000."

The Democratic party has now, as it always has had, a sufficient number of men of sturdy honesty, marked ability and thorough devotion to principle to fill the administrative offices of the Government:

"Is the fame of Bayard, Manning, Fairchild, Endicott, Whitney, Vilas, Dickinson, Garland, members of the 1884 Cabinet, and Olney, Carlisle, Lamont, Smith, Francis, Herbert, Bissell, Wilson and Harmon, of that of 1892, dwarfed when contrasted with the Cabinet officers of to-day?"

The Vermont Election

The Vermont State election, coming as it does just before the national election, has always been looked upon as a sort of political barometer. Both parties are accustomed to consider that the "normal" Republican plurality is about 25,000, and if it falls much below it is taken to indicate that the doubtful States will go Democratic. At least this has been the case since 1876. Consequently the Republicans feel much encouraged over the result of the recent election, for the Republican plurality is 31,556, more than it was four years ago. The vote on Governor was: Bell (Republican), 48,077; Porter (Democratic), 16,521. In 1896 the Republican plurality was 38,391 and in 1900 it was 31,312.

European Parliamentary Delegates

The Interparliamentary Conferences between the legislators of different countries which have done so much in the past few years to promote peace and secure the passage of the many arbitration treaties in Europe are this year to be extended to the United States, and 300 of the foreign delegates to the Interparliamentary Congress at St. Louis are now in this country. Among them the best known are Count Robert Apponyi, the Hungarian leader and one of the greatest statesmen in Europe; William Ralph Cremer, a member of the British Parliament since 1885 and the founder of the Interparliamentary Union; Sir Philip Stanhope, Colonel Sir Howard Vincent, Count George Karolyi and John Lund. The party are guests of our Government, and will be taken on a tour through the country, beginning at West Point and extending as far as Colorado. Six days will be spent at St. Louis, where the Congress will discuss such questions as the following:

1. Laws of war.
2. The rights and duties of neutrals.
3. Immunity of private property at sea during war.
4. Bombardment of towns, ports, villages.
5. Limitation of armaments.
6. Forcible collection of unadjudged claims against a nation.
7. The execution of arbitration treaties.
8. The termination of the Russo-Japanese war.

It is hoped that such an effect may be made upon the American public that the United States may be brought into the family of nations now bound together by treaties of arbitration. The English members started many years ago with the intention of securing a treaty with this country, but it was rejected by the Senate. In the meantime treaties have been arranged without difficulty with France, Germany and Japan, while our country still holds out against the movement. Mr. Cremer, the carpenter statesman, who holds the Nobel Prize for his efforts in behalf of peace, gives the following account of the founding of the Interparliamentary union:

"It grew out of the effort that was made in 1887 to initiate a treaty of arbitration between Great Britain and the United States. I had formulated the memorial briefly, referring to the manifestations in the American Congress of a sentiment favorable to such a treaty. I secured 234 signatures of members of Parliament, and subsequently was one of twelve members who brought the memorial to Washington. It was in the spring of the next year that the union was organized with 40 members, and the year following there were 110 members present at the meeting in Paris. Tho the treaty with the United States, which suggested the organization, is yet unaccomplished, I am hopeful that we may soon secure it."

It was decided, in spite of the opposition of M. Cochery, the French deputy, to ask the Powers signatory to The Hague convention to intervene in the Russo-Japanese War. President Roosevelt will be asked to call a second session of The Hague Convention with a view to establishing a permanent Congress of Nations to supplement The Hague Court, with definite and original powers over certain international questions.

The Settlement of the Strikes

Of the three great labor strikes which have disturbed the industrial peace of our great cities, two, the Subway and the meat strike, have come to a close, and the third, in the building trades, is probably near to its conclusion. In the Subway difficulty, the employees, or rather those who took up arms in their defense, have won important concessions; in the packing house industry, on the contrary, the men go back to such jobs as are left to them on no better conditions than when they left. In the matter of the New York Subway a strike was threatened by the motormen of the elevated roads because the Interborough Rapid Transit Company had engaged motormen for the Subway, soon to be opened, at the rate of $3.00 for a ten-hour day. The elevated motormen have secured $3.50 and a nine-hour day, and feared that if the lower wage rate were paid to the men underground trained to the same work it would be used as a weapon to lower their own wages. Since electricity is likely to be substituted for steam in all trains entering the city, it was considered important that wages should be kept to the same standards as for locomotive engineers. The Interborough Company finally consented to a compromise of granting $3.50 a day for ten hours' work, and a three years' agreement to that effect was signed by the officers of the company on one side and the delegates of the Brotherhoods of Locomotive Engineers and Firemen and the Amalgamated Association of Street Railway and Electric Employees on the other. No strike shall be called during the three-year period on the Subway on account of questions of time or wages. The employees of the elevated roads will have the opportunity of filling fifty per cent. of the places on the new subway. The demand of the men for a relaxation of the physical examination was refused. Regular practice trains are now running on the Subway, but it will not be opened for traffic until about October 1st.—In spite of the fact that a referendum vote of the Amalgamated Meat Cutters and Butchers' Association in Chicago, Kansas City, Omaha and St. Louis showed a large majority of the members were willing to continue the strike, President Donnelly and the Executive Committee of the association decided that it was impossible to keep up the fight longer and so declared the strike off. The men will return as individuals, and no agreements with the unions will be made. Skilled strikers will be reinstated so far as this can be done without displacing such of the strike breakers as choose to remain. Wages will remain the same as before the strike. The Allied Trades, which struck in support of the butchers, voted to remain out until better terms could be secured, but President Donnelly persuaded them of the uselessness of the attempt. The Brotherhood of Butcher Workmen of New York has severed its connection with the national organization on account of the arbitrary and foolish action of President Donnelly in calling a second strike and breaking the agreement which he had made with the packers the day previous. The strike involved 53,000 men and is estimated to have cost the men about $5,100,000 in wages and entailed a loss and extra expense to the packers of some $7,500,000. —The Macbeth-Evans Glass Company, of Pittsburg, has opened its factory at Charleroi on a non-union basis, since the old employees refused to return on the

company's terms. New men will be taken on a few at a time until a full force of about 2,300 is secured. The men will be housed and fed inside the stockade for protection.—B. F. Slagel, alias Robert Romaine, a negro miner, deported from Cripple Creek, who was arrested in Topeka, Kan., for burglary, confesses to complicity in the explosions at the Vindicator mine and the Independence station in the Cripple Creek district, and implicates a large number of members and officials of the miners' union.

France The official report of the census of 1901 has just been published. It gives the total population of the country as 38,961,945 and shows a gain of only 444,613 in ten years. This is about one-third less than the gain in England, Germany and Russia for the same decade.—The strike of the merchant marine at Marseilles, only recently composed, has again broken out on a more extensive scale, and is likely to have a serious effect upon the commerce of this city, the principal port of France. Over a million tons of shipping are tied up on the docks and much of the trade is diverted, perhaps permanently, to Italian and Spanish ports. Genoa, on account of the St. Gothard Tunnel and the new Simplon Tunnel, soon to be opened, has now the advantage of its rival and will probably secure in the present crisis a commercial supremacy over the Mediterranean hard to overcome. The strike originated in a revolt of the sailors against the arbitrary and tyrannical power exerted over them by the ship officers. There has been much rioting in the streets, which the troops have put down with difficulty. Over 80,000 persons connected with the shipping business are out of employment.—In a speech at a banquet at Auxerre, the Premier, M. Combes, stated frankly his intention of abolishing the Concordat. He regarded the results of the recent municipal and departmental elections as an indorsement of his anti-clerical policy, and he declared that he would continue his work until France was free from all dependence on foreign religious power. For thirty years the Roman Church had audaciously violated the Concordat. It had now openly torn it up and it was not his intention to try to mend it. He did not consider the risk of France losing her position as protector of the Catholics in the East as a sufficient motive to prevent the separation of Church and State. This project would, therefore, be added to the three measures which the party in power has undertaken to carry out, the reduction of military service, the income tax and old age pensions for workingmen. He was willing to make any reasonable concessions in the interests of social peace and religious liberty in order to effect a mode of separation satisfactory to both parties. The *Osservatore Romano,* the organ of the Vatican, states in reply that the Holy See has always scrupulously observed the Concordat, altho it has regarded it as quite distinct from the Organic Articles adopted afterward without its assent. The Holy See has never refused to consider the candidates for bishops proposed by the French Government and has never rejected them because they were adherents of the republic. The only rejections have been for canonical reasons, as is permitted by the Concordat. The Pope has always informed the French Government of the reasons for such rejections, altho it was under no obligation to do so. In an address to 1,500 French pilgrims the Pope used very kindly and conciliatory language in regard to the relations between France and the Vatican, which is taken to indicate that he has not given up all hope of healing the breach. The Bishop of Dijon and the Bishop of Laval, who were summoned before the Holy Office to answer to the charges of improper conduct, the former accused of being a Freemason and the latter of immorality, and who were supported by the French Government in their refusal to go to Rome, both went to Rome privately and have made their peace with the Pope. The charges against them have been withdrawn, and they have been appointed bishops *in partibus,* with their salaries paid by the Vatican instead of the French Government.

Turkish Troubles An official report from Constantinople states that the Turkish troops are held in check at Van in Asiatic Turkey by the Armenian insurgents, who advanced within 400 yards of the French Consulate. The people of Van are finding refuge in

schools and convents. Turkey is considering the mobilization of the Fourth Army Corps and the withdrawal of troops from Asia Minor, in order to suppress the insurrection.—The American Consul at Harput wires to the State Department that he has visited Bitlis and is now in Mush. The district of Sasun is tranquil—its strategic points garrisoned by infantry. The condition of the survivors of the massacre is deplorable. They are absolutely destitute, but would attempt to rebuild their burned villages with a little Government aid. The victims of the massacre number 3,500. The American colony at Bitlis is in no apparent danger.—In the Mush district the insurgents maintain a guerrilla warfare. They demand certain reforms of local administration before disbanding. A number of villages have been plundered and burned, many persons have been killed and the survivors are in extreme need. Another massacre is daily dreaded and the Armenians do not doubt its imminence. Seventeen thousand of the people are starving, and only a small sum has as yet reached the American Board of Commissioners for Foreign Missions at Bitlis. Much more is needed at once, as the prevailing conditions are like those in Macedonia a year ago. A mutiny has broken out among the Turkish troops marching against the Albanians, making the situation in Old Servia a serious problem.

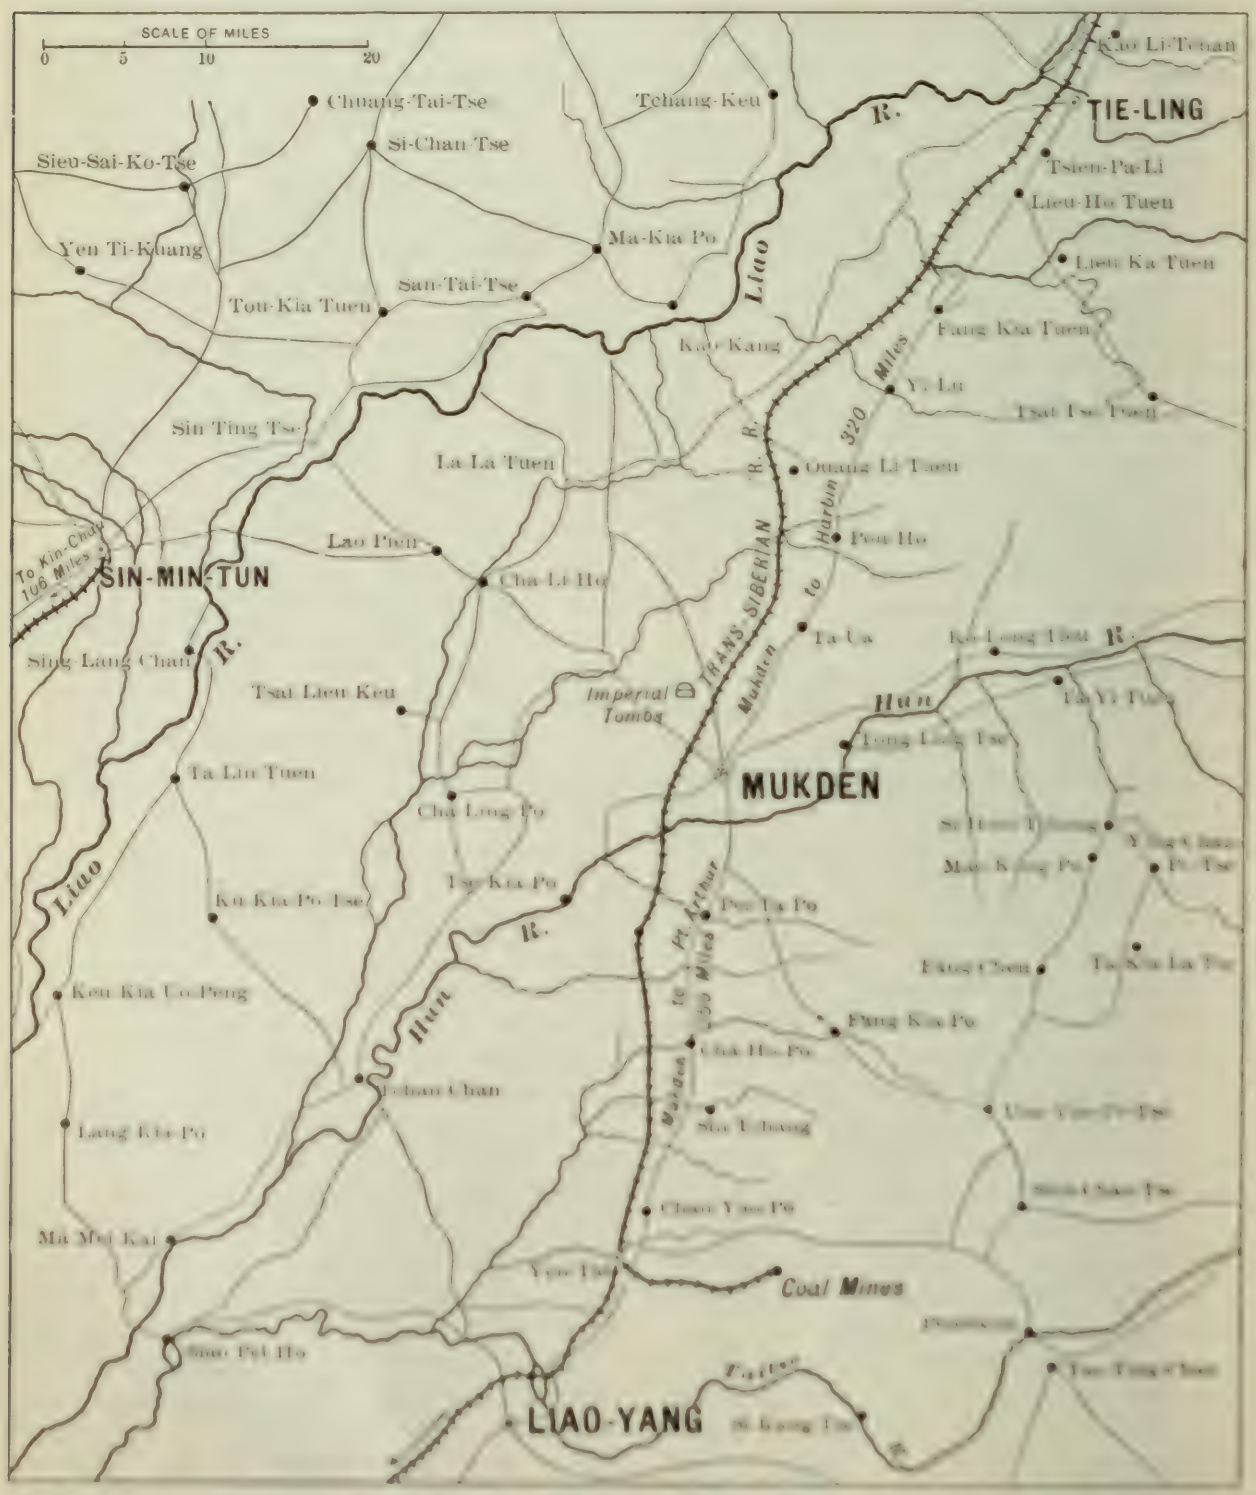
The Treaty of Lhasa

The British expedition into Tibet has at last attained its object in the establishment of treaty relations with the Government at Lhasa after eight months of marching, waiting and fighting in a region which by nature and population is the most inhospitable on the globe. On September 7th Colonel Younghusband entered for the first time the palace of the Grand Lama at Potala, and signed a political and commercial treaty. Tibet was represented by the Regent and Councillors and the Chinese Amban, or envoy. The treaty was then read in Tibetan, but the English version will be published later by the Foreign Office at Simla. Afterward Colonel Younghusband made a short address, in which he called attention to the moderation of the demands made. The British Government had not interfered in the slightest degree with the internal affairs of the country, and had recognized the continued suzerainty of China. No territory is annexed, and the British had merely sought to secure the observance of the treaty of 1890, to establish trade relations between India and Tibet, and to insure that Tibet should not depart from her traditional policy in regard to political relations with other countries. The Dalai Lama has fled into Mongolia with his Russian adviser, Dorjieff, where a party is said to be rising in his support. In case he should fail to reestablish his power his ancient ecclesiastical rival, the Tashi Lama, who has shown himself friendly to the English, is likely to become the head of Church and State. The British Mission will return to India about September 16th unless delayed by the flood in the Sanpo River. The Tibetans show themselves eager to sell curiosities and art treasures, and the geographical and archeological results of the expedition will unquestionably be of value, whatever may be the outcome of its political purposes.

The Cape to Cairo Railway

Just twenty-five years ago the late Henry M. Stanley penetrated the vast region about the great lakes of Central Africa. Forty-eight per cent. of the projected "Cape to Cairo" railway is already constructed, part of it through the heart of "Darkest Africa." Trains run from the Mediterranean to Assuan, 600 miles up the Nile, and from Wady Halfa to Khartum, the present terminus. From Cape Town another line runs via Kimberley, Mafeking and Buluwayo to Victoria Falls—a distance of 1,000 miles. Northward from Victoria Falls a road is being constructed to Broken Hill Mines, 350 miles distant. A 400-mile line is projected to the southern extremity of Lake Tanganyika. Of the 3,000 miles lying between Victoria Falls and Khartum, 1,600 miles form a water route, 1,400 miles must be covered by rail, 800 miles between Victoria Falls and Lake Tanganyika. Projected railways uniting several waterways cover the gaps. The objection to the route seems to be

the inconvenient transfers from boat to train, but that will be doubtless a temporary trouble. The dream of the African explorer will be realized, and the whistle of the train will be heard from Cairo to Cape Town. A right of way will have to be secured from Germany, but the value of the line to German residents will probably insure the grant. The map of Africa is rapidly changing before our eyes.



The Russian Retreat

After their defeat at Liao-Yang the Russians retreated to Mukden, the ancient capital of Manchuria, as rapidly as the muddy roads would permit. The Japanese pursued closely and there was continuous fighting with the rear guard. The main Japanese army, under General Kuroki, however, after taking the coal mines of Yentai, moved north parallel with the Russian line of march and about 27 miles east of the railroad. On the other side General Oku's force, about 20 miles west of the railroad, kept up with the Russians. Neither wing was able to cut off a portion of the retreating column or to capture artillery or locomotives. The heaviest rainstorms of the season impeded the operations on both sides, and entailed the greatest hardships on the troops. The artillery was dragged through the mud by long lines of horses and oxen. The Hun River, before Mukden, overflowed its banks and the Chinese boats navigated the streets of that city. Headquarters have been established at Tie-Ling (Tie Pass), to which place the wounded, the stores and many of the troops have been conveyed, so it is doubtful if General Kuropatkin, unless too hotly pressed by Field Marshal Oyama, will make a stand at Mukden. Tie-Ling is protected from attack from the south by the Liao River, as Mukden is by the Hun River, but the former has stronger natural defenses. Altho the number of men engaged in the battle of Liao-Yang was greater than in any previous battle of which we have reliable information, the loss does not appear to have been so great as in several engagements of recent times. The Russian loss is not exactly known, but is roughly estimated at 25,000. The Japanese official report gives the number of killed and wounded on their side between August 26th and September 3d as 17,539, including 136 officers killed and 464 wounded. The army on the left, under General Oku, which made the attack on the Russian center on the railroad, suffered most severely, losing 7,691 men. The right, under General Kuroki, lost 4,866, and the center, under General Nodzu, 4,992. The Japanese buried 3,000 Russians on the field of battle. The number of Russian wounded conveyed to Mukden is given at 12,300. The town of Liao-Yang and most of the stores were destroyed by fire before the Japanese entered in the morning of September 7th. The Japanese officers were unable to restrain their men after their six days' fighting, and there was much looting of Chinese shops, especially those in which Russian goods were found. The correspondent of the London *Times* says that the battle of Liao-Yang was fought without much strategy, but with the utmost bravery on both sides:

> "I am satisfied that Oku commands the finest infantry in the world. I do not believe that any other army could in five days deliver eight unsuccessful infantry assaults against intrenchments and still persevere."

The cavalry took no noticeable part in the campaign. All the critics agree in praising General Kuropatkin for his success in extricating his defeated army from an enemy of superior force, which had nearly surrounded it, and in removing so large a part of the guns, stores and wounded to a place of safety, in spite of the bad condition of the roads and the exhaustion of his men. The superior mobility of the Japanese is thought to be largely due to the division of the troops into three distinct armies; the Russians have taken a lesson from their enemies in this, and will divide the army into two parts, both under the general command of Kuropatkin, but with General Linevitch and General Baron Kaulbars, respectively, in charge of the two armies. General Kaulbars will go out with the two army corps now organizing in the governments of Kazan, Odessa, Vilna and Kieff. General Linevitch has been or-

dered by telegraph from Vladivostok to Mukden. — Nothing definite is known in regard to Port Arthur, tho there are the usual rumors of repeated assaults and great slaughters, coming via Che-Foo. The Baltic fleet of forty vessels is again reported to have started for the Far East.—The converted cruiser "Lena," direct from Vladivostok, has arrived at San Francisco. Captain Benlinsky, in command, states that he came in response to an urgent request from the Russian Consul-General at San Francisco that a war vessel be sent to that port. According to the captain her boilers are so defective as to make the vessel practically helpless, and she will be dismantled and repaired, which will probably require a month. This raises the same questions as the Che-Foo and Shanghai incidents in regard to neutral ports.

Map of the country through which the Russians have retreated from Liao-Yang to Mukden and Tie-Ling, followed by the Japanese, who are not far south of Mukden.

On the Enjoyment of Things One Does Not Have

BY FREDERICK SMITH

I HAVE long looked forward to the pleasure of some day writing upon the enjoyment of gardens. That would come, of course, when I had a garden of my own, in which to employ the morning hours planting and watering, and the evening with some congenial book or friend. In the meantime, while waiting on experience, I have, in a measure, anticipated my garden days,—have even gone so far as to plan my essay and decide what happenings I shall chronicle, what advice give, and with what words I shall endeavor to entice others to garden joys. But the other night, while I was about this delectable business, it suddenly came to me that I might never have a garden, and never, therefore, be fully competent to write of one. Yet, no sooner had this thought staggered me than I was solaced by another and more cheerful: it was that a man may very wisely and honestly enjoy and profit by many things which he does not possess, and, indeed, be quite capable of pointing out their delights to others.

In a moment of cynicism I was moved to say that the one who does not have things is best fitted to tell of their pleasures—whether he speak of gardens, or of books, or travel, or a wife; for real gardens will grow weeds, books are more than often a nuisance, and wives have an unpleasant habit of finding out a man's faults. But I would not willingly pose for a cynic; and, after all, the degree of ability to communicate pleasure is beside the question. What I wish to prove is, that to enjoy what one has not is part of the plain wisdom of life; and further, that one who earnestly sets about such enjoyment may possess more of the world than is, at first, supposed.

My garden is a case in point. Altho I have no fee simple, the inclosure is very real to me. It is of an inviting smallness, a green jewel in a gray town. Upon one side is a little gabled house, with broad windows opening from the breakfast room and the library, and on the three outer sides are high stone walls, with ivy and climbing roses. The walls shut it off from the common view and insure greater quiet, so that those who come into it value it the more, and to its owner it is more truly a part of his home.

Neither long drought nor continued rain affects it. There are always just the right number of flowering plants, and just enough intrusive weeds to save it from annoying perfection. The broad-leaved chestnut casts its shade precisely over the bench I like to sit on: the little fish-pool nearby is clean and freshly cool. Besides the plants I have mentioned, there is an apple tree, which I like best in pink and white blossom. The little peach is oftenest laden with round and bloomy fruit. The flowers change constantly with small regard to season, and on any day of the year you may find daffodils and violets, hollyhocks and hyacinths, pansies and Canterbury bells, foxglove and mignonette—and roses, always roses; those upon trees and those upon little bushes, deep red and lady's pink, pure white and pale yellow.

The garden is of a just formality; neither too stiffly laid out as to paths and plots, nor yet a place without metes and bounds, where grass encroaches on beds, and flowers riot over walks; but all in a nice harmony to please the careful eye.

In such a garden one may have many full hours. After pottering about in an

old coat among my plants, I like best to sit under the chestnut and read aloud to my companion, from a book of verses, say Dobson, who is an admirable garden poet, disposing sundials and box hedges and rose trees with rare discrimination, and introducing you to pretty young ladies in lawn and lilac, or to genial old country gentlemen with cultivated tastes in tobacco and books. But that is only for a beginning. I oftener choose further back and read Marvel, or Cowley, or Randolph, or Goldsmith; and if you have any of these with illustrations by Mr. Abbey and Mr. Parsons you have an excellent garden book.

He would be a dull man who, finding me among my flowers and in such company, would tell me that I know nothing of garden delights.

It is in much the same spirit that I talk of my library, for so I possess and enjoy it. I have not twenty books to my hand now, yet you could do worse than pattern your library after mine. I have already said that its broad, small-paned windows open on the garden, thus assuring one a good outlook on pleasing tranquillity. The room is long and low and beamed across. There is a fireplace, but we do not depend on that for heat—there is a proper furnace under the house. The open fire is to warm and brighten the imagination, to toast one's shins and one's wits before in the early spring or the late autumn.

The bookcases go to a man's hight on the walls, and many a night have I spent choosing their contents. I invariably begin by taking to luncheon a friend of mine, who is employed in an uptown book store, and who is my final authority on such matters. Over a bottle of red Burgundy—the best wine above which to talk about books—he sets down the volumes I ought to have, and I add those I really want. This order I turn over to him to fill. In a fortnight, I unload the boxes. For convention's sake, and the children's, you can depend upon it there are Dickens and Balzac and Macaulay and Gibbon, for tho I do not rush at any of these nowadays in my reading, there is no knowing when one may wish to freshen one's memory about a saying of Mrs. Gamp, or a doing of one of the Cæsars. For similar reasons there are Shakespeare and the old dramatists, Spenser and Browning, after their kind, Montaigne and Hazlitt, after their kind. Altho I am not a collector, even a man of modest means must have a few choicely bound books to remind him that such things should be; so there is a volume from the Doves' Bindery that will please a connoisseur, and a strong and beautiful book from the hands of Roger Payne.

The volumes that will be thumb-worn are fewer. I insist on a copy of "The Oxford Book of English Verse," where I can pocket it at any moment. I want my old student's edition of Wordsworth at hand's reach; and I shall have Robert Herrick and George Herbert and Heinrich Heine together on a near shelf. Stevenson and Thoreau will be on the table, and Mr. Henry James—I may as well own to a penchant for moderns;—and so will André Theuriet and Daudet, and their compatriots who write with the words of men and angels. All of these you may see, not to mention a half dozen volumes in whatever binding I can get them from my own pen.

Is not this a room to take comfort in? It has pictures upon the walls—landscapes showing wet meadows, and winding roads on breezy lands. There are a few bronzes and white statues. But mostly you will see around the spoils of my extensive travels. He who knows how to enjoy what he does not have need not stay at home. So, when I am tired of a quiet life, I go wandering. In my time I have been a student at the great universities, have fought duels at Jena, rowed in the eights at Oxford, and put through many a night in the cabarets of the Latin Quarter. I have made a canoe trip down the Danube and over the fireplace in the library is the paddle to remind me of it. There, on the table, is a small earthen jug that I connect with a blue-eyed girl in a coast town of Sweden; there is a lasso from my wild life on the plains; a sky-blue turquoise bought of a merchant at Ispahan; a green jade god from a Chinese temple and the ears of a man-eating tiger that I shot after he had killed three of my attendants and as he was in the act of springing upon me. Truly, there are no limits to my traveling, and I might tell of more surprising doings, such as my mission with Bernard of Clairvaux, when he preached the second crusade

throughout France; or how, later, I was with Captain Kidd when he murdered William Moore.

On my more sedate wanderings I am not alone, nor, as I have already hinted, do I lack companionship on my small estate. Often among the flowers, or by the winter fire, or walking with me under the quiet stars I see a woman. In her presence the garden blossoms more abundantly, the blaze is more kindly and the stars seem to give an added benison.

In a position somewhat similar to mine the poet Cowley expressed a wish for "a mistress moderately fair." I am for no such half measures. "Whoe'er she be, that not impossible she" is the fairest among women, a rose in Sharon.

And yet—in a way not strange to men—the woman who sits in my garden or who goes over the world with me is not always the same. She has protean qualities. Sometimes she has the blue eyes, the braided yellow hair and the quaint sweetness of expression that I knew in that northern girl long ago; and I see her sewing in a broad sunny window and smiling up at me as I enter. Sometimes she is slender and dark haired, and as we sit before the fire on a stormy night I can hear her soft voice linger over the lines of some old poem till the world turns back a thousand years and gentle knights and fair ladies and terrible dragons come into the little scene. Or else she is strong-limbed and brown of cheek, and we two are together on a wide moor, the wind beating in our faces, a road winding over the hills before us, and the joy of life high in our hearts.

Sometimes—but more and more rarely, and never in my garden—she is a woman opulent in beauty, with red lips and a bosom white above her low bodice; on her hands are many jewels and these match the flash in her dark eyes. In those eyes there is a challenge as she lights her cigaret at mine; her voice, as it lilts in a French song, is an invitation; and as she rests her hand on my shoulder her presence is like poppies.

And then again I see her on a stage, a girl radiant and winning, holding multitudes by her rich voice, her expressive gesture and her pervading charm; admired by all, courted by many, yet keeping safe in her heart her rarest smile for me.

But most often she is a fine calm-faced woman, with brown, smoothly parted hair and shining eyes. Whether I see her in the simpler frocks of our village, or in the city in the splendor of an evening gown, I think she is the fairest of mortals. But I like her best opposite me at the breakfast table, where I can see her white hands managing among the cups. I fancy that my coffee is never so right as when she prepares it. Indeed, in every way I insist she is an admirable cook. She soothes me in sickness, and counsels me in health. She loves the old books that I love; she has been with me on many journeys.

It is when I am with her in the garden at home that I see the others—those two small persons who are knit so closely to my life; who try me with hard questions, yet who believe my every word. I am glad when they come in ruddy-faced from play; I am proud when their mother sends them admonishingly to school, and I am in a cold terror if one of them has an unaccountable cough. They scarcely know good from bad, yet much of the small goodness I have I feel that I owe to them. Their hands are weak, but they have more than once lifted me over hard places. Finally, it is for them that I cultivate my garden.

In a like manner I might go on to tell of the friends whom I enjoy in my solitude; of the gardener in his old brown coat; of the chum of my youth who comes to sit under the chestnut and discuss the past; of the man of science who hunts with me; of the painter who sometimes honors my garden by making pictures of it; of the vicar—I am a good American, but I never could get on with a minister, I insist on a vicar in a clerical waistcoat—and, last, of the ladies of the village who frequently take tea with us.

I say, I might go on, but I trust I have detailed enough to show that tho I am not a rich man in any way, I do not lack property, or experience, or companions, and I am prepared to maintain against any that the life in our house is of the fullest and happiest.

So I hold that tho I never have a garden or a wife, I shall at least have known something of them. And if I, why not many others? The whole secret of the enjoyment of things one does not have is to allow the mind to dwell on

them as if they were at hand, instead of, as is too often the case, thinking of them merely to lament their absence. To picture what one might have had is to lay the foundation of regrets, but to inclose a garden of which one assumes himself the real possessor is to taste many true joys. He is a poor fellow, indeed, who has not some fleeting visions; to cherish them and build upon them means, in the end, great gain.

And certainly it is neither wrong nor unwise to build air-castles. A little dreaming does not prevent doing. It is rather a delight and a stimulus. The world's effective men have been dreamers. One who dreams of gardens, or of beautiful lands, or of friendships with good people, is not necessarily an idler or foredoomed to failure. If he does not acquire or know, he is bound to be more lively about his common business, to be happier himself, and a source of greater happiness to the world about him. And further, one who honestly enjoys things which he has not, will not be so ready wrongly to covet similar things when he sees them in the hands of his neighbors. They may have houses and horses, but he also can boast of possessions.

But there is another and a deeper reason for this same enjoyment of the things we do not have. For better or for worse, man should possess the world and know all its sides. The garden once had will never be quite as he has pictured it, nor the wife fair in the ways he has imagined; yet it is well for him to acquire both. The real garden will have unexpected compensations for its lacks, and he will grow in proportion as he has to rise to meet its deficiencies: the real wife will be fine as he had not thought of her, and as he learns to renounce and readjust for her sake he will be the more a man.

Now it is a fact that this joyous contemplation of things not at hand, this anticipatory possession which I have suggested, leads, in many cases, straight to real proprietorship. "If a man thinks a thousand dollars hard enough, he will be found to have a thousand dolllars," says Thoreau. The phrase contains a fine truth. We may take dollars as symbolizing both the material and spiritual; if a man thinks gardens, or health, or knowledge, or the love of a good woman, and thinks them hard enough, that will go far toward making them his. Somehow the mind reaches out and acquires the things it dwells on; somehow the world bends itself to us as we assume that it is ours; as we pipe to it so will it dance, as we mourn so must we expect lamenting.

The wise man, therefore, possesses himself in fancy and looks forward confidently to fact. He may stroll in green gardens and hear the nightingale at any hour of the night; some day a blue-bird will build in his apple tree. If he likes adventure, he may draw a sword with Gustavus Adolphus, attack an alp with Whymper, or flirt with Ninon de l'Enclos; some day he will climb Snowdon and drink tea with a duchess—at a bazaar. Even a crusty bachelor may keep board with the Queen of Sheba, and, in the end, get what is far better for him, a quiet wife.

New York City.

"And God-Speed Her Home"

BY LOUISE DUNHAM GOLDSBERRY

Here where the tremulous shadows fall,
Sunshine and shadow, God's beautiful pall,
Lay her down softly—oh, fair, fair!
Lilies in hand of her, stainlessly white;
White was the love keeping heart that she bare,
Lilies in hand of her, fair with the fair—
Kiss her and God-speed her home.

Grasses shall o'er her grow silkenly soft,
Rain-drops shall whisper her, birds wing aloft;
Wing her and sing her earth's mystery song,
Winds in the open, winds in the low,
Stars sing and dews sing day and night long;
Sing her and wing her earth's ecstasy song—
Then kiss her and God-speed her home.

Worcester, D. C.

A New North Pole Expedition

BY CHARLES BÉNARD

[M. Charles Bénard, who was born some thirty-six years ago, is an officer on the retired list of the French Navy. He is also President of the Oceanographic Society of the Bay of Biscay, member of the Standing Committee of the International Naval Association and General Secretary of the Southwestern Branch of the French Maritime League. He is the learned originator of the remarkable scheme described below, which has received the formal approval of many of the leading men of science of France.—EDITOR.]

THE Arctic regions are occupied by a deep maritime basin in which the ice, with which it is almost wholly covered, floats about at the mercy of the winds and currents. The extreme-

CHARLES BÉNARD

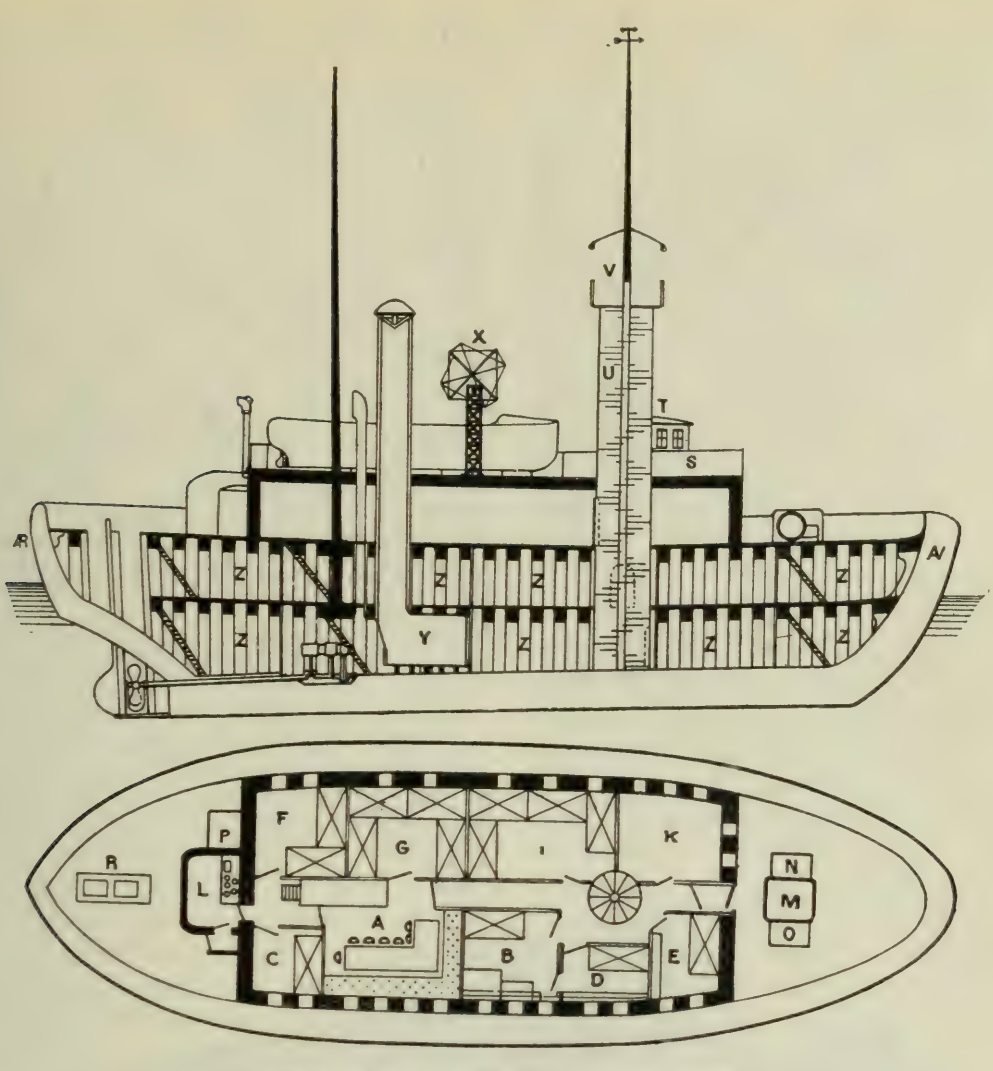
ly abundant supply of water poured out into this basin by the great rivers of Northern Russia, Siberia and North America, and the snowfall on the iceberg glaciers, adds an appreciable supplementary weight to the sea surface and raises the general level of the Arctic Ocean, which suffices to produce an expansive movement that seeks an outlet through the natural channels of Behring Strait, Smith Sound and the grand gateway lying between Greenland and Norway.

But there is another factor in the problem of considerable importance, whose influence is permanent and truly wonderful. This, added to the ones already mentioned, produces in the Arctic basin a general circulation of the whole mass of water and ice. I refer to the in-pouring of the warm equatorial waters accumulated by the trade winds in the Gulf of Mexico, carried by the Gulf Stream along the European coasts and then pushed on into the Arctic Ocean by the

dominant southwest winds of the North Atlantic.

These waters pass between Iceland and Norway, which they free from ice throughout the whole summer, then penetrate into Barents Sea, breaking up the ice there, thus making it possible for ships to sail quite easily along the western coast of Nova Zembla and reach the southern part of the Francis Joseph Archipelago. These same waters free the shores of Spitzbergen, which are thus opened each year quite early to the whalers, explorers and hunters.

This fresh in-flow of salt water, which mingles with the fluvial in-flow already mentioned, produces in the regions to the north and east of the New Siberia Archipelago a vast cold clearing-out current which carries before it all the fragments of the central ice-fields, forming thus a mighty drift toward the eastern coast of Greenland. This cold current bears along on its surface floes, icefields, icebergs, hummocks, etc., and washes up along this coast an almost insuperable barrier. When this current reaches Cape Farewell it divides, one portion descending straight toward Newfoundland, while the other follows up along the west coast of Greenland and goes to increase the current in Baffin Bay, which bears along the ice drifts of Smith, Jones and Lancaster Sounds and Hudson Strait. It is this last mentioned current which carries icebergs even down to the latitude of Naples, and its power plays an important and capricious part in the meteorology of Europe.



Analogous to these sea currents, but much less definite because more difficult to observe, are the phenomena of the atmosphere so intimately connected with the great low pressure barometric waves. The proofs of these facts are found in the study of certain normal air currents in certain constant depressions and in the physical causes which produce the aurora borealis.

What are the laws which govern these great marine and aerial streams? What are, each month, their exact zones of influence? Such are the parameters of the Polar question about which it would be most useful and important to know all that is possible.

If rational scientific explorations were to be carried on in various parts of the Polar sphere, the limits and the real character of the Polar basin could be determined in a precise manner and the static principles of the hydro-meteorological problem would be settled. We would, in a word, understand the basin into which are carried and where disappear, as in a moderator, the excesses of temperature of the equatorial and tropical waters and the accumulations of cold of the ice-fields. There would be left for us to determine only variable dynamic influences, such as the annual importance of glaciation, the respective positions of the different kinds of ice masses, the discharge of the Siberian and American rivers, and, above all, the approximate cubic value, in velocity and temperature, of the in-flow of tepid waters from the North Atlantic.

On all these elements depends the estimate of the importance of the ice flow along the coasts of Greenland and Labrador, and on this flow depends the extent, intensity and duration of the melting of the ice-fields and icebergs which accumulate each year on the coast and the banks of Newfoundland. On the length of time that these ice elements remain there depends, in a large measure, the meteorology of Europe and also the temperature of the waters which pass on into the Polar Sea.

If we bear in mind what influence the variations of the seasons have in anemometry, temperature and humidity and how closely these latter are related to the dangers of navigation, to the sea fisheries, the products of agriculture, the development of epidemics and epizootics, the conditions affecting inland streams and the great rivers flowing into the ocean,—it will be readily admitted that we cannot be too eager to study these subjects, to make every research possible in this connection, to find out the underlying causes bearing on them, and to arrive at the possibility of making forecasts which would be so beneficial to the general economy. This is why Arctic and thalassographical expeditions, which many people still look upon as only affairs of theoretical science, as examples of heroic sport and useless courage, are, on the contrary, undertakings destined in the highest degree to furnish the

learned world information bearing on the sciences of meteorology and hydrology, so directly connected with the material interests of mankind. It is only necessary to glance for an instant at the list of Arctic expeditions in all countries to perceive the practical results immediately due to them.

The voyages made by Danes, Icelanders and Englishmen to Labrador and Greenland developed the whale fisheries and the seal fisheries in the neighboring seas. Those undertaken by the Dutch, Norwegians and the Russians have accomplished the same results at Spitzbergen and in the Barents Sea, where these industries are, for certain regions, the chief source of revenue. The unsuccessful efforts of the English to find the Northwest Passage gave birth to the cod fisheries of Newfoundland, and developed the fur-trading stations of Hudson Bay and Upper Canada, "those acres of snow," as Voltaire disdainfully dubbed what is now the Dominion. The attempts to traverse the Northeast Passage made it possible to open up regular communication between Europe and the great Siberian rivers, while, further on, they led to the discovery of veritable mines of fossil ivory, whose exploitation has produced fine results. The finding of gold in the Klondike region of Alaska has hastened the mineralogical explora-

tion of the ice-lands. Sooner or later miners will swarm about the Polar sphere, and I feel sure that in a few years coal, phosphates and all the many treasures which the snowy shroud has hidden and kept intact for long centuries will be laid bare and added to the development of human industry. In the not distant future tourists and hunters who have found their way to Spitzbergen will wish to push on to Greenland, to Francis Joseph Land, to the islands of New Siberia, to Grinnell Land, to the Parry Islands. Physicians will look thither for the intense cold capable of curing "tainted blood and exasperated nerves," to employ an expression of Pictet.

In these new outposts, called into being by the needs of life and the demands of human activity, will spring up those "scientific monasteries" so much desired by the learned geographer Schrader, or at least temporary stations for study and observation like the one at Red Bay, erected by Prince Albert of Monaco. Wireless telegraphy and the telephone, which ice conditions cannot affect, will make it possible for these distant observers to furnish the rest of the world a daily chart of the state of things in the Arctic basin. By means of this chart and that of the general maritime meteorology it will be possible to follow the course of the grand atmospheric waves, to predict the weather, announce the periods of rain and drought and to inform the farmer, sailor and fisherman what he must do to protect himself against nature itself. Their calling can then be carried on on strictly scientific lines.

Humanity has now put a period to the migration which, since the earliest prehistoric times, has always turned toward the warmer climes, for science and civilization have now made it possible to render all climates, in a measure at least, uniform. It is now high time that man exploit rationally the Polar regions, just as he began by exploiting the temperate zone, then the tropical one; just as he first made use of the rivers, then of the seas, and is now turning his attention to the upper air.

I consider as absolutely useless all those expeditions whose only aim is to reach the Pole, and which adopt a sort of sporting method in order to attain their end, using sleds and being unprovided with the means for proper investigations. They can be of no benefit to science. I admire the endurance and the heroism of Captain Gagni, but I cannot refrain asking myself the question whether, on the whole, the efforts which he made and the risks which he took were worth the results which he obtained. This admirable officer, who holds the record for the Pole, was not provided with the necessary instruments for making complete meteorological observations, could not take deep-sea soundings, nor dredge, nor procure specimens of water, plankton, or fishes. He has not reported a single oceanographic fact concerning a sea on whose surface he moved about for many weeks.

The steerable balloon and the submarine boat have not yet entered the domain of the practical, nor is it probable that they can ever be used in the frozen seas. An ice-breaker would have to be too big and consequently too dear to accomplish in the central Arctic Ocean what Admiral Makaroff was scarcely able to do with it in the waters north of Spitzbergen and in the Kara Sea.

Taking into consideration the present advanced state of the discoveries about the Polar basin, there are but two kinds of explorations which should be considered for an instant. In the first place are annual explorations limited to the perimeter of the Polar basin, which should be as numerous as possible and should resemble those of the Prince of Monaco in Red Bay, Greely in Fort Conger Bay and Sverdrup in the Parry Archipelago. Each expedition of this kind could study a corner of the Arctic shores and thus complete, finally, our knowledge of the hydrography, geography, geology, meteorology, thalassography, glaciology, biology, magnetics, etc., of the whole coast region.

In the second place, there should be strong expeditions whose purpose would be to penetrate into the heart of the Polar basin. These expeditions should be undertaken in specially constructed ships, floating observatories and laboratories, sturdy enough to withstand pack-ice, with enough food and supplies of all kinds stored away in the hold to last during the period which the chosen route would cover.

To my mind, it is only expeditions of

this latter category that can give us the solution of this question: What is the rational route to be followed in order to reap the best harvest of meteorological, glacial, oceanographic and general scientific information of every kind? This fact accepted, and keeping in mind that it is a ship which plays the most important part in the undertaking, the route most favored to navigation should, of course, be chosen. In other words, a course should be avoided which would force the ship to stem currents against which nothing can be done because of the floating ice, which renders the ship helpless and forces it along with the current. Hence it is that we immediately eliminate from our list of possible routes those passing by Smith Sound and the eastern coast of Greenland, which are, in fact, the grand beds of the glacial flow. This statement is, furthermore, confirmed by the experience of Arctic expeditions, none yet having been able to mount the ice current along Greenland. The "Germania" and the "Lilloise" were utterly destroyed there. Some ships—the "Alert" and the "Polaris," for instance—were able to get through the Robeson Channel and reach the entrance to Lincoln Sea, but none has thought an instant of entering that sea, whose currents are constantly pressing the ice against the coasts. Nor can Spitzbergen be taken as a starting point. The ship that should try to reach the Polar Sea from there would have to struggle, at an angle of 45°, against the drift of the ice-fields and would be carried by this drift on to the east coast of Greenland. By starting from Francis Joseph Land the same difficulty would be encountered at an angle of 90°.

The only way to traverse the grand Polar basin is to repeat the voyage of the "Fram," by going a little further north; to do as did Nansen,—take a ticket by the great ice convoy. Then you will reach destination. It should be remembered that the idea of crossing the

Water Currents in the Arctic Polar Basin, According to M. Charles Bénard

Polar Sea in the direction of the great Arctic current sprang from the discovery on the eastern and southern coasts of Greenland of float-wood and buoys which had started from the Siberian coast, and also by the finding at Cape Farewell the wreckage of the "Jeannette," abandoned by her crew north of Bennett Island.

It is evident, therefore, that the start must be made from a Norwegian port, say from Tromsö or Vardö, thence across the southern part of the Barents Sea, stopping at Karabova for dogs, following along the Yalmal Peninsula between the icebergs and the coast, stopping again at Port Dickson for coal brought there by a steamer chartered for that special purpose, going then, toward the end of summer, along the Taimyr Peninsula, reaching by autumn the New Siberia Islands, and finally, instead of sailing due north, as did the "Fram," attain, at any cost, even if a winter had to be passed on one of the Liakhoff Islands or on Bennett Island, a point situated at the 150° of east longitude. This point once reached, the ship or ships will have simply to leave the rest to the drift-ice, which will carry them along across the Arctic Sea.

If our ships follow a route somewhat parallel to that taken by the "Fram," they will cross the Arctic basin on other lines than those traversed by that vessel and will surely pass in the immediate neighborhood of the North Pole. In a word, they will follow the same course as that over which the wreckage of the "Jeannette" must have gone.

I speak of two vessels and not of one, because, the proposed expedition having entered the sea of ice which is to close around them, two vessels could make the voyage at a short distance from one another, say, from 50 or 60 to 80 miles, and thus trace two lines across the Arctic Ocean instead of one, making a double series of soundings and dredgings along the bottom of the sea. They would be twin floating meteorological, magnetic and glacial physical observatories. We would thus be able to have a continual record of the course of the drift, its velocity and the azimuth change of each ship. We would also be able to follow the variation of the distance of each ship, the variation of the azimuth and the angular velocity of the variation of the azimuth of the line uniting the two ships —elements of capital importance for the final determination of the great general movements of the Arctic ice. The two ships would, of course, be provided with wireless telegraphic apparatus, and so could communicate with one another during the voyage; and because of the comparatively short distance separating them, the two crews could, if anything happened, take refuge in one or the other ship.

Admitting that the two ships start from a point near the one that would be rationally chosen, and supposing that they should follow a route parallel to that of the "Fram," they would find themselves in the center of the great Polar current and would drift probably at a somewhat greater speed than did the "Fram," especially toward the end of the voyage. But their two drifts would probably bring them very near the north point of Greenland reached by Peary, and it might happen, if Greenland ends exactly at Melville Land, that one of the ships would be carried toward Robeson Channel, as has happened to larch trees which grow on the banks of the Kolyma, that river of Eastern Siberia which flows into the Arctic Ocean. If this should fortunately happen, the expedition would have solved the *rôle* of the Greenland cut-water, which, it would thus be proven, divides the Polar current in two.

As the chosen route would pass north of Francis Joseph Land and of Spitzbergen, it would be well, each summer, to establish a wireless telegraphic station to the north of these spots, so that it would be possible for the expedition to receive news from Europe and to transmit news about themselves.

I may add, in closing, that at a meeting held last June at the Paris house of the Prince of Monaco, after an interesting discussion, in which the Prince and several members of the Institute took part, the scientists present decided that the proposed expedition should carry with it all that science considers best in everything pertaining to oceanography, meteorology, biology, micro-biology, etc., etc., so that it could produce the grandest results yet accomplished by these enterprises in the Frozen North.

Translated, French

The Desire for a Future Life

BY F. C. S. SCHILLER, M.A.

[The author of the following article was instructor in philosophy at Cornell University from 1893-97, and is now a fellow and tutor of Corpus Christi College at Oxford England. He is the author of "Riddles of the Sphinx," "Axioms as Postulates in Personal Idealism," "Humanism," and is the editor of *Mind*.—EDITOR.]

IT may, perhaps, be remembered that some three years ago Dr. Richard Hodgson and the American Branch of the Society for Psychical Research issued a circular or *questionnaire* inquiring into the feelings with which the prospect of a future life was regarded by the generality of men. This circular asked a number of questions, such as, "Would you prefer to live after death or not?" "Do you desire a future life whatever the conditions might be?" "What would have to be its character to make it seem tolerable?" "Would you be content with a life more or less like your present life?" "Do you now feel the question to be of urgent importance to your mental comfort?" "Would you like to know for certain about the future life, or would you prefer to leave it a matter of faith?" etc., with a view to testing the existence and character of the desire for a future life, the reasons people gave to themselves for this desire, its intensity and past history, and the kind of assurance which would satisfy the desire. The questions were hard to answer, for a variety of reasons: because few are accustomed to give an account to themselves of their feelings, because even when they have practiced self-analysis matters of feeling usually turn out to be of the greatest complexity, because there are obvious motives for reticence, etc. But, perhaps, the greatest obstacle to the collection of answers was the feeling that the point inquired into was either silly or obscure. Was it not silly to ask people whether they would like a future life, and, if so, of what sort, as if their wishes could make any difference to the facts? And if this was not the real point of the inquiry, what was it?

Modern psychology, however, is rarely as silly as it usually seems to the uninstructed, and this particular set of questions had some very important points to elucidate. In the first place, "wishes" are not so irrelevant to "facts" as is vulgarly supposed; they have a very material bearing on the discovery of "facts." To find "truth" we must pay to find it; subjects which few or none are desirous of knowing about are not likely to be investigated, and so the facts are likely to remain unknown until there is a sufficient desire to know them. Even supernatural modes of enlightenment by "revelation" would be conditioned by the attitude of the mind to be enlightened, and would presuppose some antecedent receptiveness; we could hardly, *e. g.*, conceive a revelation of the properties of an ellipse conveying any meaning to a mind which had never been interested in geometry.

Now, of course, in this case it was a common assumption that not only were people intensely interested in the question of their future life, but also that they ardently desired to know what their prospects were. This assumption, however, rests mainly on the number of (mostly very inconclusive) books which have been written on the subject, and the prominent place which most religions ap-

pear to give to the topic of immortality. But, as I have elsewhere shown—"Humanism," pp. 228-249—all these facts are really far more ambiguous than they look at first sight. The writers of books are never more than an infinitesimal minority, and it is hard to make sure that the dumb masses quite agree with their vocal leaders. The testimony of the religions, no doubt, is impressive, but then, to judge by their conduct, the vast majority of men are never wholly or truly religious, and there are apt to be great discrepancies between the beliefs which are professed and those which actually determine action. Moreover, we are growing more alive nowadays to the social side of beliefs, and beginning to realize that, not only in a democratic age like the present, but always and everywhere, the ideas and feelings of the average man are as influential and deserving of study as those of the exceptions. It seemed well, therefore, to inquire what were the feelings of ordinary people about such matters and to compare them, *e. g.*, with the extreme cases so brilliantly studied in William James's "Varieties of Religious Experience."

Again, granting the existence of a desire for a future life, was it not worth asking what sort of a future was desired? And how was it entertained? Was it a desire for a religious dogma or for scientific knowledge, or for an inward assurance, or for none of these things? Was precise and detailed information desired, or was a vague and remote hope as good or better? Was it an intense and constant craving, or a thought that crossed the mind only at rare intervals? And in any case were not statistics wanted to indicate the relative frequency of the various forms of sentiment?

If information on all these points was to be had for the asking, would it not be valuable? And might it give us a clew to some of the perennial paradoxes which beset man's attitude toward the mystery of death? A study of the actual facts of human feeling might explain why so little had ever been done to explore it, why even the religions have been so vague in the information they vouchsafed, and why religious beliefs have had so much less influence upon conduct than ought to have been inferred from the tremendous import of their revelations.

From the point of view of the Society for Psychical Research there was a further reason for this *questionnaire*. Among the topics for its researches there was, of course, the evidence, puzzling and dubious, but copious and unceasing, that somehow something in man survived "death." This evidence had never until recently been subjected to any real investigation—*i. e.*, to that systematic, sustained and minute investigation which elsewhere leads to scientific knowledge. In attempting such investigation, it was vitally important to ascertain what was likely to be the social attitude toward an enterprise of a magnitude that it might well exercise all the faculties of the best minds for centuries, and which to be carried to a successful conclusion would certainly require a considerable measure of social support. In other words, the Society for Psychical Research needed to know, as accurately as possible, how large a section of the community desired to know about a future life, how large a section wanted to know scientifically, and also what were the objections and prejudices of those who did not want to know. For all such knowledge was essential to the proper conduct of its researches.

The real scope of the questions having thus been explained, I may go on to state in general terms the purport of the answers they elicited. Numerically, these added up to some 3,200, of which about two thirds came from America. These numbers are, of course, quite inadequate to determine the actual frequency of the various types of sentiment, and they would have been hardly less insufficient for this purpose if they had been ten or a hundred times greater. But the numbers are large enough to constitute the common types of sentiment, and to represent a great variety of others, of which some seem never before to have found expression in the literature, and may, therefore, claim to be "new to science." And a careful examination and interpretation of the answers will also support some probable conclusions as to the spiritual make-up of the persons who answered the questions readily and with various degrees of reluctance, thus permitting inferences to the feelings of those similarly constituted who could not be prevailed on to answer at all.

Thus, as might have been expected, a great majority voted for a future life with or without reservations. But seeing that the questions were so worded that those who wanted to go on living could make their own conditions, only those who did not desire to continue under any circumstances would answer *No* to the first question. There were indications further that such *Nos* were harder to poll, and it is obvious that the wholly indifferent would but rarely take the trouble to answer the questions. Hence, the majority in favor of a continued existence is probably far less decisive than would appear from the returns.

On the other hand, there was a surprisingly large number of answers (over 20 per cent.) making no conditions in their demand for a future life. Strictly interpreted, this would imply the belief that even the worst kind of existence was good, and that even "hell" was preferable to annihilation. And this philosophically may seem unreasonable and a paradox. Theologically, on the other hand, it would seem that only such a preference could conceivably reconcile the institution of hell with the goodness of God, so that we should marvel rather at the numbers of sincere Christians who, instinctively but unorthodoxly, preferred non-existence to torment. And as a matter of psychological fact, most of those who answered thus either did not believe in "hell" at all, or had, under stress of emotion, for the time forgotten the existence of this doctrine. It deserves further to be noted that as these answers proceeded from those most keenly desirous of a continued existence, the census returns may probably exaggerate the importance of this type of sentiment. Still it is evidently a good deal commoner than might have been supposed.

It is, however, the later questions, inquiring into the urgent importance of the belief and the desire to know, that are most fertile in surprises. Only a minority, even of the voters, are willing to regard a future life as being of present importance to them. And of these a large number would prefer to "leave it a matter of faith." Now, of those who would prefer "faith," some, doubtless, would not be averse from knowledge as well, even tho they would hardly bestir themselves to find out. But in addition we find large numbers who definitely disclaim a desire for knowledge, or declare themsleves indifferent, or while professing a desire to know admit that it is not urgent. Altogether, hardly more than a fifth of the answers can, upon critical examination, be counted upon as indicating a real desire for scientific knowledge of a future life.

And clearly those who want to know were more likely to answer the questions than those who do not, either because they are indifferent or hostile or content with "faith." This percentage, therefore, represents the *maximum* strength of the desire to know. In point of fact, it may be very much weaker. As far as the Psychical Research Society is concerned, it has got its answer out of the returns. As things stand, its investigations do not appeal to more than one-fifth of the public, and as likely as not but a tenth or a fiftieth are really interested in them or desirous that anything should be discovered. And yet there is probably *more* interest now than ever before. Whether it is either extensive or intense enough remains to be seen. Fortunately, the Society is at last awakening to the existence of these difficulties, and to the necessity of raising an adequate endowment in order to carry on permanently a work which must be both prolonged and expensive, if it is to be thorough and scientific. Personally, I incline to believe that there has now been aroused enough interest to raise the money to find, or rather to *train,* the men, and so to insure the proper investigation of the matter. But whether this will be done in ten years, or in fifty, or in a hundred, will depend largely on what must be called the accident of interesting the suitable people at the critical time.

Apart from throwing light on the main question as to whether there is a real desire for scientific knowledge, the answers contain also many hints on other points of psychological interest. It is, for example, somewhat curious that *men* should have contributed about sixty per cent. of the answers, in spite of the fact that they are far less leisured as a class than women, and apparently far more absorbed in the material concerns of life. As reasons for this sex-difference it may

be suggested that the spiritual interests of women are more apt to run in established grooves, that they are on the average less well educated and less inclined to reflection, besides being more reticent by nature.

Another very interesting point concerns the existence of national differences in sentiment. These undoubtedly exist, but, unfortunately, the bulk of the answers came from America and England, and so those from other countries were too few to permit of any definite description of the differences. A considerable batch of answers from India seemed to indicate a greater prevalence of a pessimistic estimate of the value of human life, and, of course, assumed (even among Parsis and Mohammedans!) the belief in rebirth (instead of heaven or hell) as the form a future life might naturally be expected to take. Consequently rebellion against the current beliefs not infrequently took the form of accepting heaven or hell, just as Western dissentients frequently declared in favor of rebirth. As between America and England the differences were not great; my impression is that the American answers showed rather more optimism and a greater willingness to take risks.

To the great variety of the answers allusion has already been made; taken in the lump, the answers formed an eloquent testimony to the inherent and ineradicable individualism or protestantism of the human mind. For even within each type of sentiment there were infinite shades of difference, and it was impossible not to feel that even the same formulas meant different things in the context of a different personality. And so even the quaintest combinations of sentiment and opinion seemed in their concrete union to cohere together logically, even tho antecedently and in the abstract they might have seemed hopelessly incompatible. In short, the answers were full of instruction to a sympathetic psychologist, and many of them in addition were excellent reading. It was noteworthy, however, that the best and most interesting answers did not, as a rule, proceed from the most learned and eminent people; possibly here also the development of habits of systematic thinking acts as a check on the depth of the feelings. In any case it must be confessed that from the psychologist's point of view the appeal to the people has fully justified itself.

In concluding this brief discussion of the subject, I should finally explain that it has necessarily had to be very general, partly because many points have not yet been worked out with statistical precision, partly because the others have been discussed in much greater detail in an article which is to appear in the forthcoming number of the "Proceedings" of the Psychical Research Society in October next. Those who, therefore, are interested to know more will there find a fuller and more systematic account than it has been possible to give within the limits of this paper.

OXFORD, ENGLAND

What Football Does

BY THE REV. A. E. COLTON

FIELD-AGENT OF THE AMERICAN BIBLE SOCIETY FOR THE NEW ENGLAND STATES

MY boy is full back on one of the Boston High School teams, and I wish to record my satisfaction and delight in the education and training, not to say *virtues,* which have resulted from his experience.

Patience.—For three years he has worn football togs for a considerable part of his waking hours from middle September to middle November. The first year he learned to sit on the side lines and wait for exhaustion or injury to one of the regulars whose place he might fill. He did not wish any of his friends harm, but he did long for a chance to put his shoulder to the wheel. Game after game passed by, and no chance to show what he could do! All the glory he had was in the practice games when the regulars wanted something to smash into. That first year he learned pretty well the rudiments of *patience.* He could have retired then in disgust, but he hung on.

Obedience.—The second year he made the team in a quasi sort of way, contesting with others the right to a place behind the line. The third year he made the team and has played in and through every game. From the first, absolute *obedience* to the coach was a law not to be trifled with; he had earned a dislike to side lines and knew that the slightest insubordination or appearance of dissatisfaction with the coach's ruling would put him out of the game instantly. Sharp words and an occasional blow or shove from the coach were taken in lamblike submission. He learned that the coach was the court of first and last appeal, absolute monarch and supreme dictator.

Self-Denial.—To his surprise, this big fellow, with a digestive apparatus like a cider mill, found that he must take thought as to whether this or that meat, drink or pastry was muscle forming, wind stopping, bone hardening, or not. All pies had looked alike to the big, hearty boy until he was a football player, and then the family was thrown into consternation by the "great-American-living-pie-storehouse," as he had called himself, leaving the table just before the "good stuff" appeared. This soon became chronic, and pie and puddings, pork and coffee were resolutely put away without even a last lingering Lot's-wife-look behind.

All engagements which interfered with football practice were set one side, and an early to bed habit was formed. The one lesson in the matter of diet—what is and what is not for the best wind, endurance, strength—tho costing much self-sacrifice, was valuable.

Self-Control.—Anything that teaches self-control must be welcome to parents watching a lad's development. Of course, the lesson of never talking back to the coach was quickly learned. But it had to be learned even in the excitement of the battle with the most aggravating circumstances. No matter if the other fellow does "slug," the law of the committee is "no slugging." That was not taken seriously until in the first of the great contests for supremacy one of the best players was put off and out of the game and was not allowed to play again in any of the league games. The boys found they must not pummel the other side, even in supposed self-defense. No boy wanted to lose his place even for a day.

Submergence of Self.—Everything for the team as a whole and nothing for personal prowess. If any men come in for a scolding it is the so-called "best players," who do things on their own hook "for star playing" too often. They have their names in the paper, but they bring upon their heads over and over the lashing sarcasm of the coach. "All for the team" is the motto—push, pull, interfere, everything—to get the man with the ball along. To get that machine of eleven independent, and one might al-

most say discordant, elements to work as *one* man, made it necessary to reduce the eleven *egos* there to a fraction of a one. In that submergence, no matter what the papers said or the spectators, our F. B. took no credit to himself, for if he did get the touchdowns pretty often, it was, he would modestly explain, "Because the guards in front of him opened holes for him to go through, while the backs were pushed and the tackles pulled." Nothing is more absurd than for the man with the ball to make a bow to the grand stand and bleachers. The football gridiron is no stage; it is life. The other fellows helped do it perhaps more than you did yourself. So F. B. has learned.

Alertness.—Of course, beef counts, and the city papers always discounted this special team because it was great on the scales. And these fellows valued their bigness until a little team from a distance —which we notice has not been beaten this season—came along and they lined up against the elephants. But the little fellows were full of chain lightning, *Under, over* and *around* they went, starting their plays with a jump, and every man in the bunch helping the fellow with the ball. They formed magnificent interference and kept things moving with a speed the big fellows did not think was possible. Our F. B. found that more than *weight* is needed for success, at least on the gridiron. To follow the ball, to see where it is going, to anticipate plays, to break through interference,—one must be alert, with "eyes in the back of his head," and a "thinker" in that head to decide and act in a flash. Especially must one be alert in falling on the ball. Some one drops it and the victory may all depend on getting the pigskin. It takes quickness to do it.

The Bigness of Trifles.—Fumbling, when everything else favors, is often disastrous. Too great eagerness of one or two, in starting too soon, results in a penalty of 20 yards or more of lost ground. Everything counts, and the one weak spot in the line will soon be found out and hammered for gains and, therefore, victory.

Endurance.—What a splendid lesson F. B. has learned in that virtue! His team has been defeated but once in 15 games. And this quality of *endurance* has been, among many, the biggest factor. Other years this team has started out well, but not till this season has it been able to hold out through the last five minutes of play. Game after game has shown this F. B.'s team strong on "wind." I do not know what the coach has done, but he has put the boys through some disciplining which has meant "*Never say die.*" He says between the halves, "Boys, you've got to win!" *And they do win.* Hard as nails every one of them, and their wind is like that from a pair of patent bellows, which blows on both the up and down stroke. Always the other team is the most exhausted, and always at the end of the game our boys come off fresh. Nothing spectacular has been taught, but a steady forcing of the oppenents yard after yard, keeping it up and *keeping it up*, till the goal has been passed. One important game was won, with a very few seconds left, all because of the splendid form of the boys in ceaselessly keeping at it to the finish.

Joys of Victory and Sorrows of Defeat.—Both of these have been important lessons. F. B. had a ride with another one of the team on the shoulders of the boys from the grounds to the dressing room. Then there was a defeat which caused some of the boys to shed tears and look as if the skies had fallen. F. B. came home and for the first time in our recollection he merely minced at his dinner, and went right to bed. He looked old in the morning, but it only made us laugh at him and tell him to wait till he struck some of the rocks of business or professional life. These smiles and tears of life's struggle come along fast enough. We can't expect to make touchdowns every time we buck the world; sometimes we are "thrown back for a loss."

Courage.—Then there is the absolute necessity of *courage*. There is no place on a team for the one who stops to think of possible injury. A good player is fearless and thinks not of what may happen to him. And facts show that these fearless players are the ones least often hurt. They must have the *honor* of the school at stake, and forget themselves in the glory they are helping to win for the

school, which at every game is represented with yells and colors and bravos to inspire and rouse all the fighting spirit the team possesses.

Cleanliness.—To see the team after a hard game, when the ground has been a bit soft—tousled, grimy, bruised, faces deep lined—that is a time to repel, even disgust, a novice or stranger to the mysteries of football glories. But when F. B. appears at dinner after the daily shower bath and rub down at one of Boston's splendidly equipped school buildings, we see that cleanliness must be a virtue to add to the long list of good things which football exacts from its devotees.

But some one says the *dangers to life and limb.* A rough game means certain possibilities, but F. B. has played three years without an hour's injury, and none of his team have had more than a temporary soreness.

Scholarship must be maintained. Several of the good men have been laid off because of neglect of studies. It is a severe strain to make a man work his hardest during the afternoon in practice and then face the harder lessons at night. *No weakling,* physical or mental, should undertake it. Our F. B. held up his scholarship as never before.

Physical perfection is the final analysis—the big residuum of the season's strenuous effort. What could possibly compare with the training and preparation the boys have gone through with to fit them for the hard work of the school through the winter? F. B. comes out of the season in prime condition for the hardest kind of tackling and protracted endeavor with languages, physics and mathematics.

Thus we gladly pay our tribute to the great game which is doing so much for developing our young men physically and morally, preparing them for the hard grinding battles of coming days.

BOSTON, MASS

The Belated Christ

BY GERTRUDE HUNTINGTON McGIFFERT

LONG the great God patient waited,
Waited for the Christ belated,
For the Christ that was to be.

Oft the heavens, sadly bending,
Mourned the unseen dove ascending,
For no Christ was yet to be.

Mighty prophets failed, unknowing
God his sonship was bestowing;
Blind—the Christ they might not be.

Some on mountain tops chose glory.
E'en Hell mocked their piteous story—
Their lost right the Christ to be.

Some the Christ-life lived, till, failing
At the cross, went shuddering, wailing,
That the Christ they dared not be.

Some found death too sweet a guerdon,
Shrank the final fearful burden,
Would not rise the Christ to be.

And the good God patient waited,
Waited for the Christ belated,
For the Christ that was to be.

Till came One who, lowly bending,
Saw the heavenly dove descending,
And left all the Christ to be.

Tempted not by this world's gaining,
Tempted not by right of reigning,
Left it all the Christ to be.

Lost himself for love of others,
Gave himself to save his brothers,
Winning power God's Christ to be

Bore for them the crucifixion,
Dared for them the resurrection,
Evermore their Christ to be.

NICE, FRANCE.

Seizure of the Daughters

Details from Delphi

BY CLIFTON H. LEVY, PH.D.

IT is now more than a year since the first announcement was made in THE INDEPENDENT of the remarkable discoveries made on the site of Delphi by M. Theophile Homolle, head of the French School at Athens. Then were published some of his beautiful "Restorations" of majestic columns and impressive buildings, such as the Treasuries of the various states of Greece, etc. He is just now giving to the world some of the detailed finds upon which these restorations were based, together with the specific information as to the statues

A Greek Portrait Head

Head of Antinous

which have been recovered either complete or in fragments and the parts of the ancient buildings discovered in the course of his excavations.

It is hardly necessary to state that the quality of the material is as high as that of any discoveries made throughout Greece, for only the best was good enough for the greatest of Greek shrines,

of Leucippus by Castor and Polydeuces

one of the wealthiest of Grecian cities. The "finds" range all the way from torsos and bits of heads and arms to entire façades, but on each and all are sculptures which are priceless to those who would gather all that the Greek genius held for mankind.

M. Homolle has not yet written a published line on his work, sending out a few of the magnificent plates with promise of text to follow, but the pictures of the sculptured subjects are in themselves an inspiration. We may not know who carved this group or that head, but we cannot fail to respond to their appeal for appreciation, no matter from whose hands they come. In some instances it has been impossible to identify the subjects of some of the statues, but they are no less beautiful or impressive on that account.

Here, for instance, is a majestic figure of a man whose brow proclaims him a thinker and whose pose declares him an orator. Who he was we may never know, but he must have been some notable sage of his time to have been perpetuated in lasting marble in the chief center of Greek life.

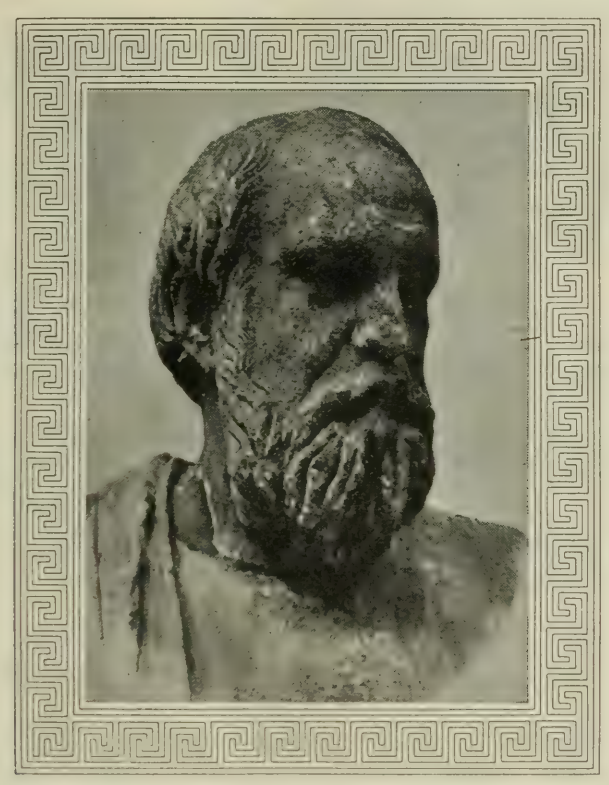
Statue of the Thessalian Agias

Here is another anonymous portrait head. Who was the original none can tell us; he may have been a senator, he may have been the general of the forces of one of the states of Hellas, but whoever he was, we have his portrait done by a master hand.

It has been an easier task for the excavators to identify some of the groups based upon the mythology of Greece, for, knowing the story of this or that hero, of Hercules or Theseus, it was comparatively easy when the figure of a man and a lion was found to see in it Hercules and the lion, or, when the body of a man and the remains of a bull-headed creature was discovered, to see in it the struggle between Theseus and the Minotaur.

One such group is reproduced here, for its artistic value as well as the story to

which it refers. Here are the famed horses of Castor and Polydeuces, and it is supposed that the group represents the carrying away of the daughters of Leucippus, King of Messenia, by the ill-fated Twins. As a consequence of this adventure the brothers were compelled to fight with Idas and Lynceus, the sons of Aphareus, to whom the two maidens had been betrothed. In the cambat Castor was slain by Idas, but Polydeuces slew Lynceus, and Jove himself slew Idas with a thunderbolt. Thereupon Polydeuces, who could not bear to be separated from his brother, begs Zeus to permit them to remain together, and the petition is granted on the condition that they may both spend alternate days in Hades and on Olympus. It is supposed by those who try to interpret the Greek myths as personifications of natural objects and forces that Castor and Polydeuces are the morning and evening star, or dawn and dusk. Another suggestion is that in the Dioscuri flitting about on their golden wings is represented the St. Elmo's fire or will o' the wisp. But no matter what they represented, the Twin Brothers were widely venerated, especially at Athens; festivals were instituted in their honor, and in Sparta they were held as the tutelary deities of the state.



Draped Statue of an Old Man

Another method of identifying "finds" is that of comparison with statues already known, and in this way a beautiful head of Antinous has been properly named. Those who recollect the legend will remember that Antinous was a beautiful page of the Emperor Hadrian, who was drowned in the Nile. The Emperor, in his regret, named cities after him and issued coins in his honor, raising him to the rank of the gods. Temples and festivals were instituted in his honor, and even oracles were pronounced in his name, which may account for the placing of his statue at Delphi. The desire to perpetuate his features in marble is said to have imparted a great impulse to sculpture in the second century, and quite a large number of these statues have been found and are now preserved in the museums of the Vatican, the Louvre, the Lateran, Berlin, etc. The fine statue identified as that of Agias is by no means one of the minor discoveries made at Delphi. This poet belonged to a special class, the Cyclic poets, who devoted their lines to the description of the return of the Greek heroes from the siege of Troy. Agias himself is credited with the composition of a poem called the "Nostoi," from its name a record of those returning home. The statue is a

splendid specimen of one of the best periods of Greek art.

It is impossible here to indicate in detail all that M. Homolle was so fortunate as to find during the ten years' work at Delphi, but he has dug down to the oldest strata of the ruins, unearthing some of the most primitive statues of Apollo and of other deities, many parts of the tripods with curiously turned heads, the metopes of the lordly buildings that once graced the slope of the hill or were sheltered beneath the cliff of Rocky Pytho, and given us back much of ancient Delphi that will make possible a proper conception of all that it meant to the Hellenes.

Head of an Old Man. Detail of Preceding Statue

To An Old Portrait

BY EDMUND KEMPER BROADUS

Maiden fair of long ago,
Is it yearning, is it love
In those dreamy-tender eyes?
Are they brooding as the dove?
Are they as the serpent wise—
Maiden fair of long ago?

Maiden fair of long ago,
With what pretty coquetries
Hast thou danced the minuet?
In those dreamy-tender eyes
What bright visions linger yet—
Maiden fair of long ago?

Maiden fair of long ago,
Is it saint or is it lover
Whom thy fancy bids arise,
Whom the silken lashes cover
In those dreamy-tender eyes—
Maiden fair of long ago?

Maiden fair of long ago,
Changeless through the changeful tides,
Shrinéd in youth's paradise.
Still the haunting secret hides
In those dreamy-tender eyes—
Maiden fair of long ago.

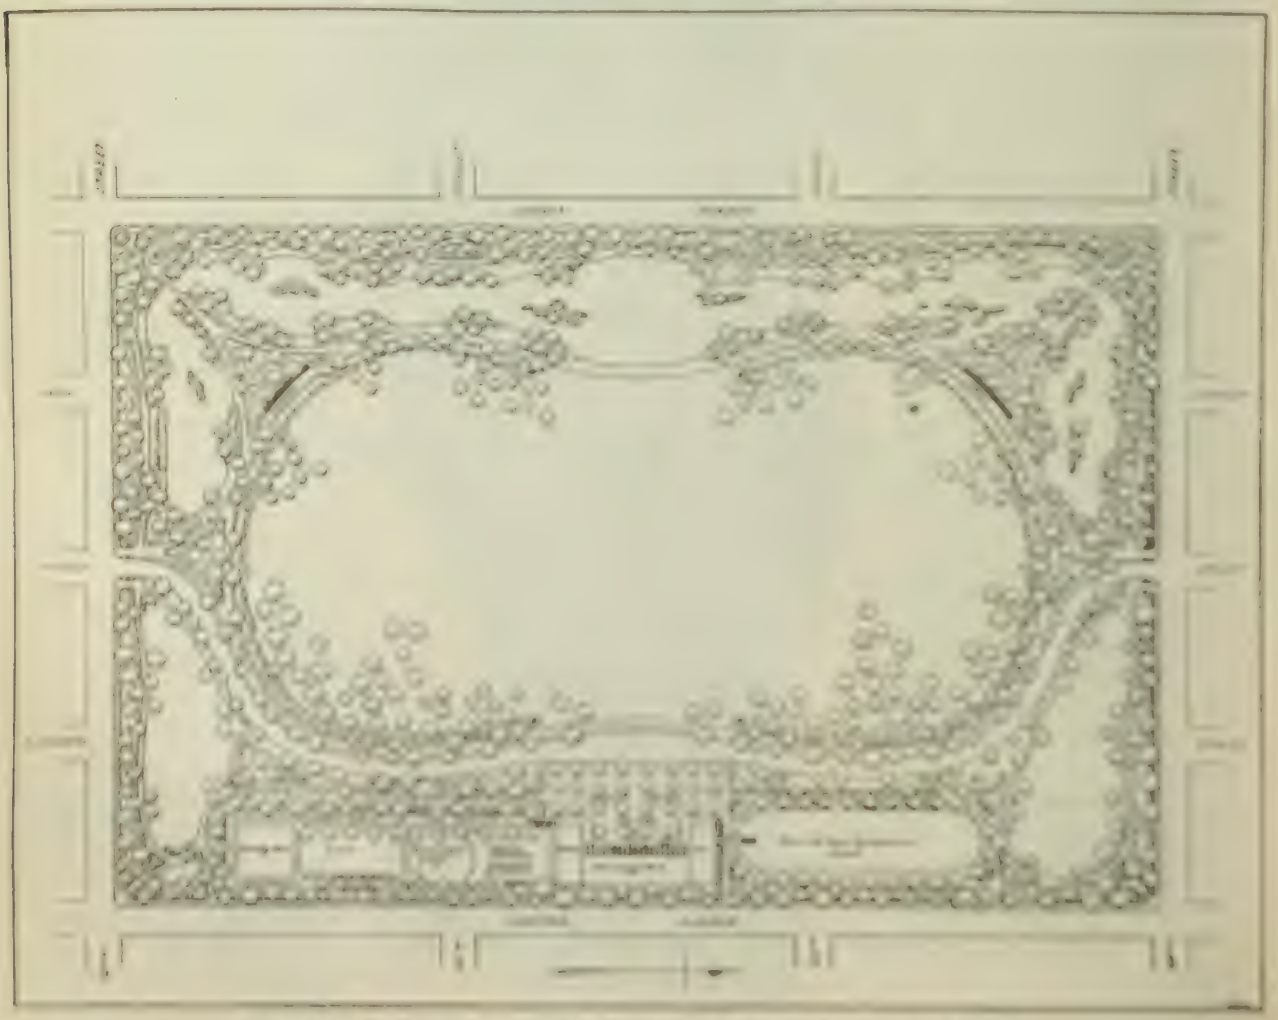
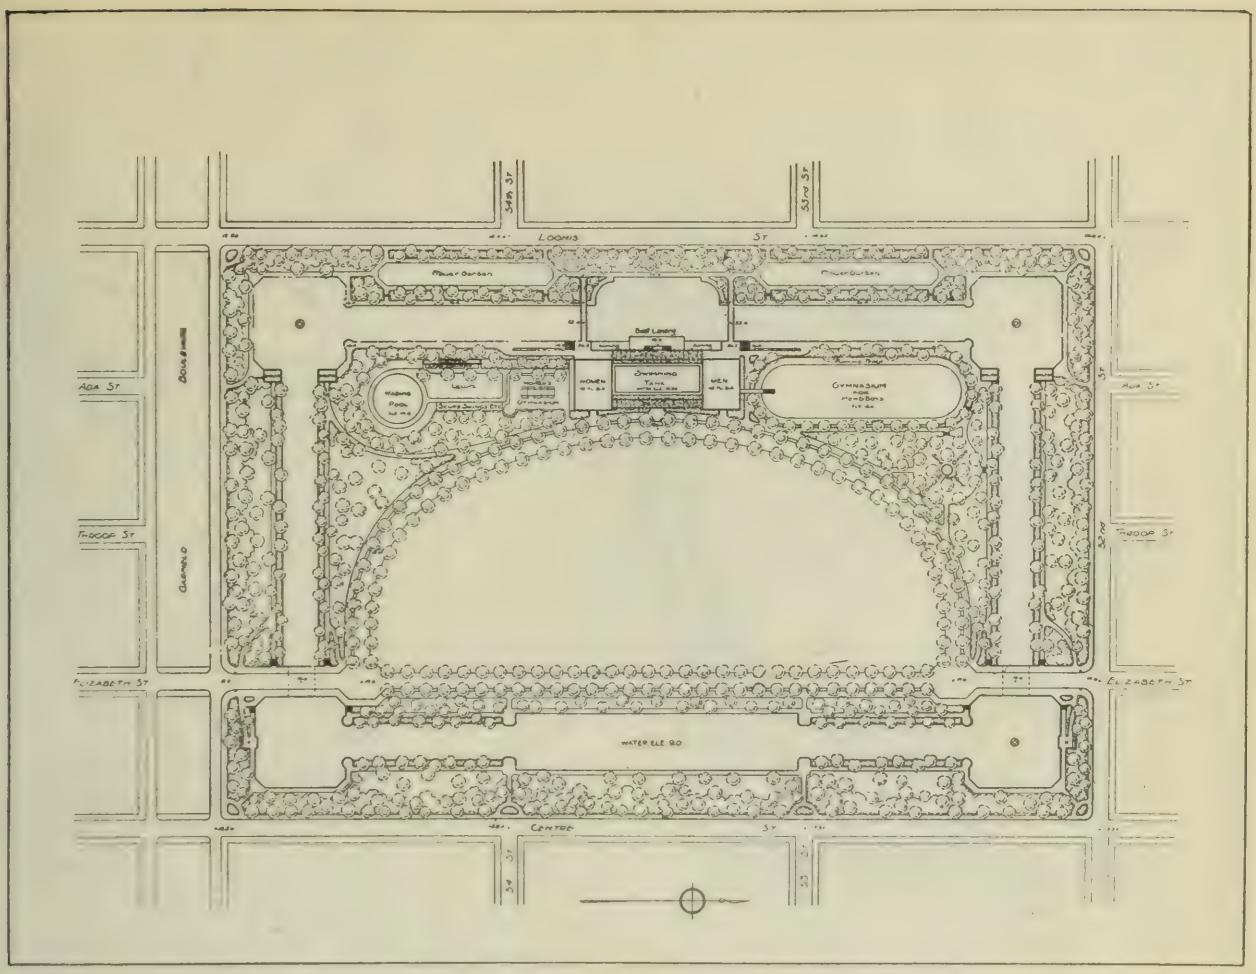
Chicago's Ten-Million Dollar Experiment in Social Redemption

BY THE REV. GEORGE L. McNUTT



[Our readers need no word of introduction to Mr. McNutt, who for the past few years has been working as a day laborer when he has not been lecturing throughout the country. If our readers ever have the chance to hear him speak we advise them not to let the opportunity slip by, for he has learned many things not found in books or taught in theological seminaries.—EDITOR.]

"THERE are one hundred thousand children in Chicago who cannot tell a rose from a dandelion, nor a daisy from a violet." To prove this, a physician, armed with bouquets, visited those public schools where you can.



"Climb clean above the roof and look from the steeple,
And never see a robin, nor a beech or ellum tree!"
. . . . "but the city! city! city!
And nothin' but the city all around us ever'-wheres!"

He was astonished to find the children absolutely ignorant of the names of the most common, old-fashioned flowers, while there was scarcely a child who could not repeat the names of the popular pugilists and actors. It is pointed out by Mr. Perkins, of the Small Park Commission, that those same sections contribute most to the juvenile criminals and contagious disease epidemics. Car bandit murderers are a natural product, made to order by such conditions.

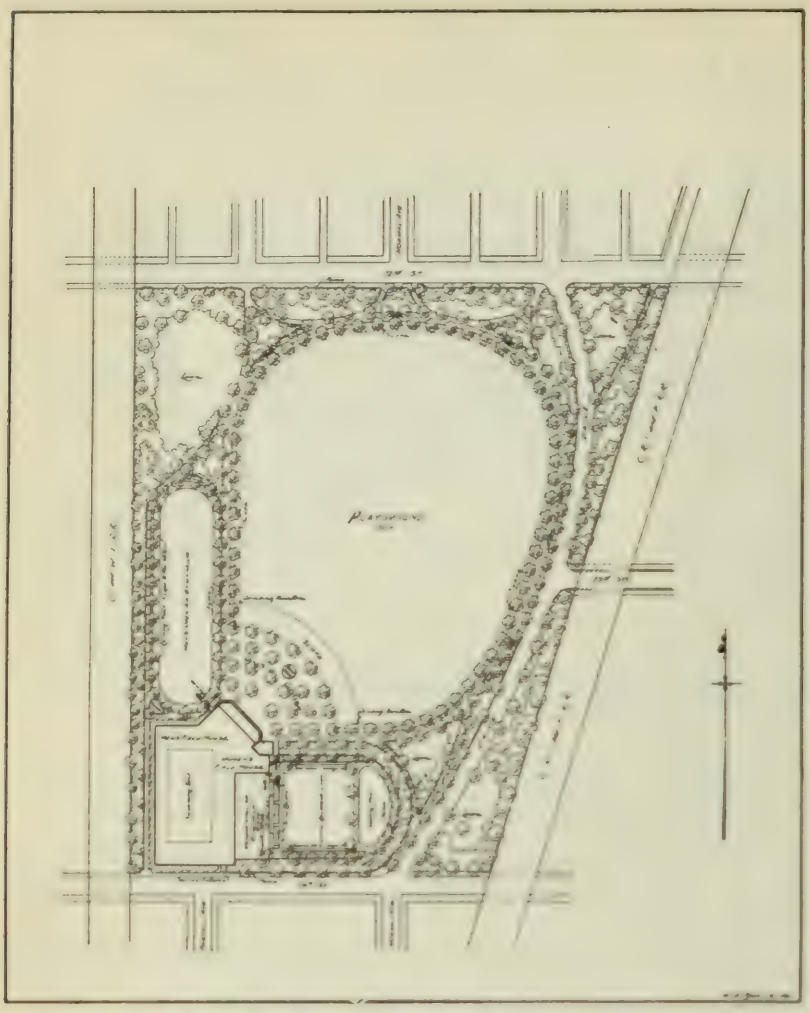
At the Massachusetts Reform School recently, of the three hundred boys there was not one country boy. The tenants of the log cabin, with their patched clothes and bare-foot children,

Park No. 8, at Sixty-seventh Street and Centre Avenue, Chicago

Park No. 7, at Garfield Boulevard and Centre Street, Chicago

may be poor, but they are not " prisoners of poverty." They are " rich as all creation," with creation at their doors.

The city cannot go



. . . " back to Griggsby station—
Back where the latchstring's a-hangin' from the door,
And ever' neighbor round the place is dear as a relation."

The city is here to stay and to grow. To grow bigger? To grow better or worse? That is *The Question* of the century.

Mr. G. A. Parker, as chairman of the Census Committee of the American Park and Out-Door Art Association, and superintendent of the 700-acre park endowed by Mr. Keney, of Hartford, made a report on the lack of parks in industrial cities like Scranton, Lowell, Fall River and Elizabeth, and the slight use of the distant naturalistic parks by the workingmen of all cities. Of the socialized park that ought to be and ought to be open every day in the year, and every hour of the day and evening, he says:

" I would have playgrounds for the children, lots of shade, and, if possible, grass, where the workingman's wife and children could sit during summer afternoons. I would have lots of seats and tables, and a superabundance of light; so that a man, after a day's work, would find a pleasant place during the evening hours, one in which, if he so desires, he could take his evening meal. I would have bright flowers, as circumstances would permit, but none or few shrubs. I would have a stadium where contests could take place, and an outdoor and indoor gymnasium. I would have a shelter with an abundance of rooms, light and heat for rainy evenings and the winter. I would have band concerts and parties. I would remember always that the workingman is an independent person and does not like to receive a service from another without giving service in return. The one thing that he does *not* need and ought not to endure is paternalism, but he does need and is willing to pay for communityism—if the city will provide the way in which it can be brought about. I believe that the park which is needed in industrial cities has not been built yet."

That was written in 1903 by a skilled specialist. It was an optimistic prophecy, a hope, one year ago. It is history in the making to day. All that *and more*

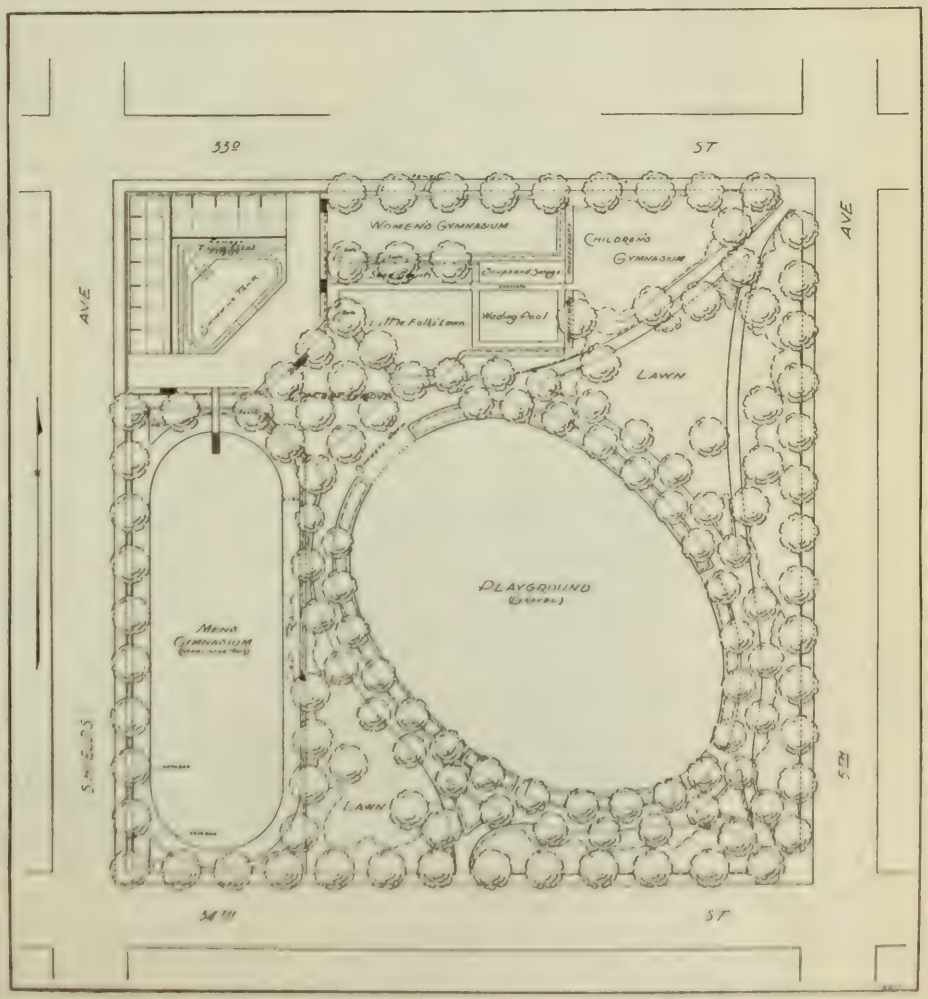
Park No. 9, at Seventy-second Street, Chicago

Chicago began to do when the frost went out of the ground in the spring of 1904.

There are twenty-eight such socialized parks to be constructed immediately; $2,500,000 of bonds have been issued by the city. Twelve thousand dollars a year is provided for the maintenance of each park. This at 4 per cent. equals the interest on $300,000. For 28 parks it means an endowment of over $8,000,000. This, with the $2,500,000 in bonds for creation, makes over a $10,000,000 investment for Chicago's experiment in *Social Redemption* through the thoroughly comprehensive use of neighborhood parks as socialized agencies.

It was the privilege of the writer to be one with a group of social settlement folks in Chicago Commons when Mr. Foster, long time superintendent of the South Park system of Chicago, outlined the scope of the work proposed to be done in the new neighborhood parks. Many cities have neighborhood parks of limited number and uncertain function. It would be unlike Chicago to copy. She was upbraided for being slow; for lacking in the humanities; for having no wider vision than the horizon of a hog. Chicago waited, watched, thought, counted the cost, and collected the cash. She hired architects, secured social engineers, and now takes the usual Chicago position in doing the "impossible"—like the World's Fair and the drainage canal, which is not only a *cloaca maxima*, but a highway to the seas and a source of water power second only to Niagara, owned by the city. Then there are the freight subways; but, biggest of all, is Chicago's grapple in the dark with the peril of Democracy—of cities so wholly given to merchandise, so overbuilt, so careful of gain, so careless of life that the city which ought to exist solely for the people becomes the prison of the people, whose self same walls shut humanity in and God and nature and neighbor out.

This is the story. The agitation for and by the Small Park Commission had secured the necessary legislation at Chicago and Springfield for 28 neighborhood parks. Just what neighborhood parks should be and do was something of a mystery. It is one thing to get a site for a factory, another to design the plant and install the machinery. That these neighborhood parks should be sites for social factories to turn out a better fabric of life seems to have been the controlling thought of Mr. Foster and his associates of the South Park Board. To this board is assigned 14 of the parks provided. The preliminary plans show the portion set aside for playfields.

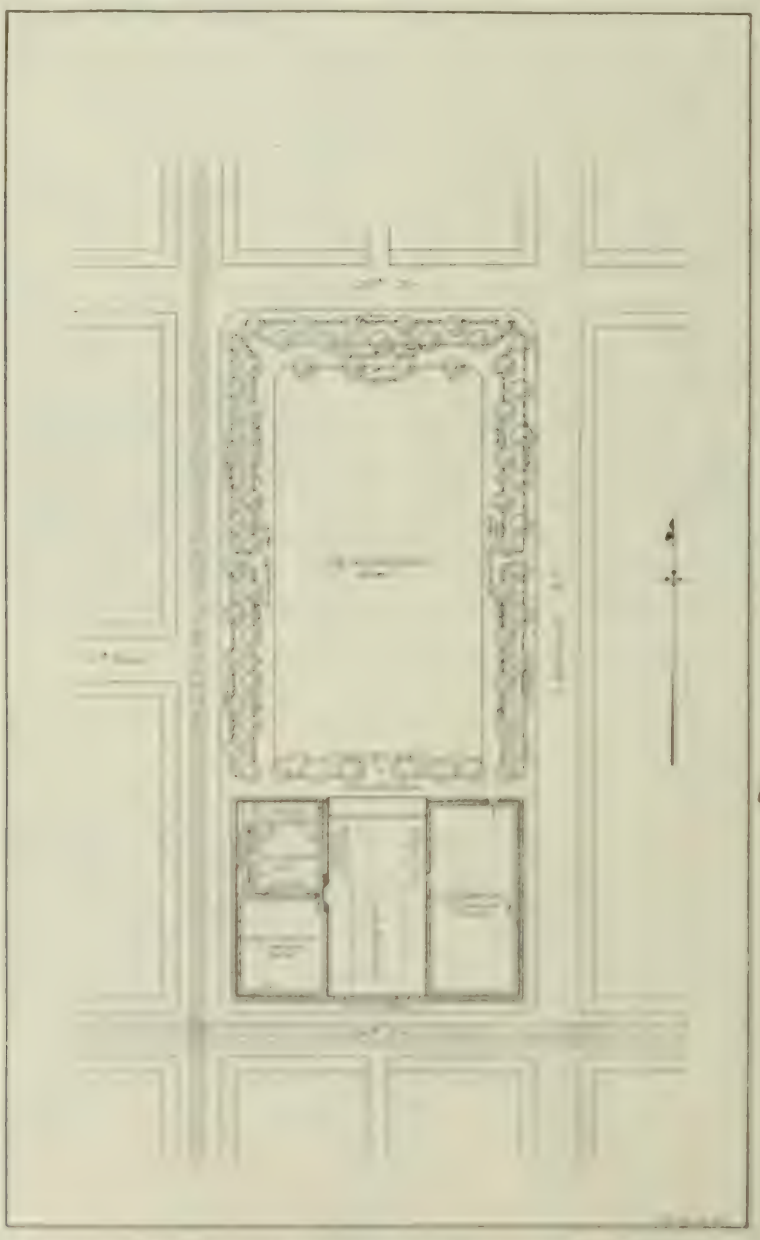


These in every case are depressed three feet and will be flooded in winter for skating. Children, so long time cursed by the city's greed and neglect, are welcomed at every point with swings, with sand gardens to make things, and wading ponds to get wet in.

Chicago has remembered the boy and his right to life, liberty and the pursuit of happiness without the pursuit of a policeman. The policeman with a club gives way to a big brother with a big heart and a head full of schemes for a jolly good time, "when work well done," in school or shop, "hath pleasure fairly won,"—a pleasure rivaling that of the "Happy Farmers." Of even greater importance than the playfields are the generously big, splendidly equipped swimming pools. You can argue, says Mr. Foster, with a boy, till you and the boy are tired, that he ought to take a sponge, tub or shower bath every day for decency's sake. He agrees with you, but dodges the bath. There is no inherited instinct for boys or ducks just to wash and be clean. But, Mr. Foster says, if you will put a great big swimming pool at the other end of your shower bath the boy, for the joy that is set before him, will take the shower bath with zest. This was proved 90,000 times at McKinley Park last year from August to September. Best of all, on the days set apart for girls and women, "ladies" from aristocratic Hyde Park drove over in carriages, took the preliminary shower, and, in the democracy of the swimming pool, ceased to be ladies and became women, the next best thing to do when you have missed being a boy.

McKinley Park, opened in 1903, has been used as an experimental station to the best possible social machinery. The picture of the Pergola and generously big swimming pool suggests classic beauty and the new humanism. Summer days are well provided for with tools for play and physical culture, and music and rest and neighborhood life. But the "melancholy days" come quickly when biting frosts and winter's wailing winds drive the people—where? Ask the saloonkeeper. He knows. He has made ready cozy nooks, warm fires, club rooms, halls and rooms for lodges and weddings and neighborhood life.

All these, with shrewd business sagacity, the man behind the bar has provided for the people. All these and more, with the same business sagacity, plus an awakening social conscience, the city of Chicago is providing for the people, paid for and endowed by the people, without a cent from anybody but "just ourselves." Here is a hint of a saloon substitute that may substitute. Paternalism has played its part. Exeat.



The social settlement group in the Commons were amazed to hear Mr. Foster quietly outline the scheme, not shown in the preliminary plans, of neighborhood park houses containing all the essential social features of Y. M. C. A.s, social settlements, institutional churches and

Park No. 3, at Shields Avenue and Thirty-third Street, Chicago

saloons. These park houses will contain an assembly room, seating 400. What for? For the people! What will they do? Ask the people. These park houses will also have reading rooms, game rooms, gymnasia—whatever ministers to the needs of the city neighborhood in a community way. "Why, this is nothing less than municipal social settlements!" says one. "It will interfere with existing social organizations." What are organizations for? Is a hospital ever so beautiful as when it is empty? So bold is the step that many good people are scared.

Many good folks are scared. They always are. Every step in humanity's ascent toward life and light has been terrifying to those who think they stand *in loco parentis* to the people, who "are not men yet," nor ever will be if democracy must forever be in tutelage to benevolent paternalism. Revelation pictures a city without a temple. Drummond conceives this to be the natural result of the work of the Church. The highest tribute to the work of Y. M. C. A.s, social settlements and all who have genuinely wrought for social redemption is to have done their work so well that the State sees the opportunity and the obligation to do for all its members what these voluntary organizations have done and could do only for a few. The State is richer than any of its members, and only the State in its communal wealth is rich enough to make

Park No. 1, at Wentworth Avenue and Twenty-fifth Street, Chicago

possible a full social redemption. We Americans would not give up State education to voluntary workers, however wise, consecrated and conscientious. Can the State do for its children, big and little, socially, what it has done intellectually, from the kindergarten to the State University? It *is* an experiment; will it succeed? That depends. Mr. Foster says:

"We can hire the architects and engineers to draw the plans, and let the contracts for the works. All that is simple; but where can we find the people to use the social tools? There will probably be for the fifteen socialized parks of the South Park system a superintendent and a resident superintendent with helpers. The policeman to prevent people from doing things is out of date and out of place here."

To meet the emergency, Prof. Graham Taylor, with his usual sagacity, has been giving a course of lectures at Chicago University on training for social service. Plainly, there is a new vocation. A very successful church-worker or Y. M. C. A. secretary might fail here. A preacher might not do until he had dropped his titles, his cloth, and had forgotten several things. Demand will create the supply.

Wherever possible these social redemption parks have been placed next to the public schools. This is for the immediate use of the schools, and also for that ultimate social use of the parks and the school buildings by all the people, where, as THE INDEPENDENT predicts, "the school house shall be the center of communal life, a thing of beauty and uplift, and a factor in the life of every man, woman and child within the sight of its walls."

It is an experiment, but not a forlorn hope. St. Paul has done successfully in a small way in its socialized Island Park, in the Mississippi River, what Chicago is preparing to do, and must do, in a big way. St. Paul has been fortunate in having an exceptional man. Dr. Ohage, in the *rôle* of Health Commissioner, has made St. Paul proud over his semi-social settlement work on Harriet Island. Mr. Foster is another Dr. Ohage, splendidly equipped to organize any enterprise that calls for brains, will power, endurance and the milk of human kindness. As Mr. Parker says: "Foster is a million-dollar man; million-dollar men may be worth more to a city than millionaires."

Here is something constructive. When those humanized parks are ready for humanity, it were a rare pleasure to sit alongside of the toiler, with his children at play, and listen to music, paid for by "all ye who labor." I would like to walk through the beautiful Pergolas, and dive off into the city's swimming hall, built and maintained by the newsboys and other aristocrats. Here is the beginnings of Social Redemption,—a city saving itself, a city finding its God by finding its neighbor.

CHICAGO, ILL.

The Swimming Tank in McKinley Park, 350 Feet Long by 150 Feet Wide, Opened in 1903. From July to September 90,000 baths were taken here. Swimming tanks similar to this in each of the fourteen new socialized parks are now being constructed in the South Park system alone.

To Uproot the Trusts

BY LUCIUS F. C. GARVIN

GOVERNOR OF RHODE ISLAND

TRUSTS have been subdivided into the good and the bad, also into the successful and the unsuccessful, but neither of these classifications is helpful.

Public opinion properly condemns all trusts; therefore, to speak of a good trust is a contradiction of terms.

Again, an industrial combination may possess the characteristics of a trust and yet for a time be unsuccessful. A signal illustration of this is the United States Steel Corporation, which, with all the elements of a trust, at present is depressed.

The popular idea of a trust is a great combination which has absorbed so many smaller concerns engaged in the same business as to be able to stifle competition and to maintain abnormally high prices for its product.

But no outsider can explain a movement so well as one who is a part of it. Hence the following definition of a trust as given by S. C. T. Todd, solicitor of the Standard Oil Company, may be accepted as authoritative:

"The term trust embraces every act, agreement or combination of persons or capital believed to be done, made or formed with the intent, power or tendency to monopolize business, to restrain or interfere with competitive trade, or to fix, influence or increase the prices of commodities."

John Moody, in his exhaustive book, "The Truth About the Trusts," enumerates Industrial, Franchise, Transportation and miscellaneous trusts, now active, to the number of 445, having a total capitalization of over $20,000,000,000, and embracing about 8,664 original companies. As a matter of convenience he omits a multitude of smaller concerns of the same character.

Thus it is seen that the question of size does not enter in either to the definition or the practical consideration of the trusts.

In order to deal with trusts effectively it is necessary first to ascertain upon what basis they rest. Their defenders claim that the trust is the logical outcome of preceding conditions; that, just as large factories have superseded small ones, so the trusts are swallowing up detached establishments engaged in the same line of business. As a result of such combination, we are told, a more skilled and less costly management is secured, and other economies consequent upon doing business upon a large scale are effected.

All this may be true and yet the trust neither be justified nor accounted for. A department store, in which one or two thousand clerks find employment; a syndicate of such stores planted in a number of cities, offer good illustrations of doing business upon a large scale. No doubt they effect many economies, but they are not trusts. The proof of this assertion lies in the fact that such stores and syndicates continue to be subject to a sharp competition and must ever so continue. Competing department stores and syndicates, or the old-fashioned shop carried on upon a small scale, will prevent the exhibition of the trust peculiarities. Unlike the trust, the department store is dependent for its success in large degree upon its ability to undersell the smaller concerns which it displaces. The reason that it cannot raise prices is that it possesses no considerable monopoly.

The one feature essential to the formation of a trust is the possession of some kind of monopoly.

A valuable subdivision of trusts would be to distinguish between those which possess Governmental favors and those which have been able to create a monopoly without the aid of special legal privileges. Illustrations of the class of trusts which have no law-made advantages are the Shipping Trust and the Ice Trust. Such combinations may obtain a temporary monopoly by absorbing as many independent plants as possible,

but in the nature of the case the monopoly so formed must be temporary and in the end unsuccessful.

But the greater number of trusts and the most dangerous ones are those which are placed by law in possession of one or more considerable monopolies. It is this which enables them for a series of years to raise the prices of their products. Such, and such alone, can succeed permanently, because given the ability to destroy competition.

The Governmental favors from which every hated trust derives its life are of various kinds. They may be bestowed by National legislation, by State legislation, or by both. The chief privilege acquired may be a patent right, a tariff tax, a transportation privilege, a franchise, the ownership of mines or other landed monoply.

Various remedies for the trust evil have been recommended.

President Roosevelt lays great stress upon publicity. Unquestionably a public accounting corresponding to that required of national banks, would do some good. It would at least afford to investors some protection against fraud and deception on the part of trust promoters.

Much emphasis has also been laid upon the necessity of preventing the over-capitalization of these great corporations. To do so would certainly give to the investing public a better knowledge of the real value of the stock and bonds, and would also furnish to legislators and to all interested an indication of the value of the special privileges possessed by each trust. But the absence of watered stock will not compel any business enterprise to meet its competitors upon equal terms, as is manifest in the case of the Standard Oil Company.

Mr. Bryan proposes that trusts be restrained by a national license, which shall forbid interstate traffic unless publicity, unwatered stock and the absence of a conspiracy to raise prices or restrict competition are established to the satisfaction of the licensing board.

Concerning this remedy it may be said that the proof of a conspiracy to raise prices would be difficult, and that some competition may seem to exist in opposition even to the most powerful of the trusts. However, Mr. Bryan's plan promises better results than any heretofore tried.

But the difficulty with the above mentioned and with all other efforts to regulate, is that our experience has shown restrictive measures to be ineffective. They leave too many loop holes for the trust magnates to creep through.

To begin with, Congress is so much under the control of monopolists that a law, when forced through by public sentiment, is passed invariably in a defective form.

Again, the executive department of the Government seems itself to be subjected to such outside influences as to be indisposed to enforce the law to its fullest extent. This has been clearly shown in the case of the Interstate Commerce act, as well as in the Sherman Anti-Trust law, whose criminal clause has never been called into use by the President or his legal advisers.

Finally, there remains that other department of the Government, the judiciary, which is given to delays, and has repeatedly shown itself subject to untoward influences, as in the 8 to 7 verdict in the President election of 1876, the income tax decision, and its denial that the Constitution follows the flag. Even the latest decision against the Northern Securities Company was so close and so narrow as to create a doubt of its application in any other anti-trust litigation which shall arise.

With all these means of escape, and with the existing custom in the United States of leaving unexecuted those laws which bear heavily upon the general public only, it is safe to assume that restrictive measures, while they may be of some avail, will in the end prove unsatisfactory and insufficient.

In fact, every such attempt to suppress evils which menace the public well-being is like clipping the tendrils of a poison ivy vine. The benefit at best is temporary.

As a poisonous plant must be uprooted in order to be destroyed, so the causes of the trust must be found and removed.

In 1899 the sugar magnate, H. O. Havemeyer, declared before the Industrial Commission that "The mother of

all trusts is the customs tariff bill." This statement contains much of truth.

Competition from abroad being shut out by a heavy tax upon imports, the leading industries at home have been enabled to combine to such an extent as to inhibit all serious competition. One of the best examples of Havemeyer's statement is his own combination, the Sugar Trust, which is directly dependent upon the tariff tax on refined sugar for its ability to put up prices. Likewise the United States Steel Corporation, altho it possesses other vast law-created special privileges, is also sheltered behind monstrous import duties.

It is a very simple proposition, and one which meets with much popular favor, to place upon the free list any article which is selling abroad at a lower price than at home. This certainly would be a blow at the very root of the trust evil. Some of the trusts it would destroy, others it would seriously cripple. Undoubtedly the free admission of trust-made commodities would do more to end the trusts than all the restrictive legislation which can be devised. Thus the placing of steel and iron upon the free list would prevent the selling of steel rails abroad at any lower price than they bring at home, in this way cutting off one of the large roots which gives life to the Steel Trust.

In the greatest of the industrial combinations, and in the most successful, the mother of trusts, the tariff, is always to be found married to some form of land monopoly.

Thus, the Standard Oil Trust is not only protected against the free importation of Russian petroleum, but also has possession of the oil fields of America, and of their channels of distribution. This monopoly of the sources of supply is due rather to State than to National legislation. The same statement may be made concerning the Coal Trust.

Possibly the time may come when our mines, forests, quarries and other valuable natural resources must be owned and perhaps operated by the Government, but at present the way would seem to be for the State to take the royalties, thereby transferring the monopoly feature of many trusts from private hands into the public treasury.

A step in this direction has been taken by the State of New York in the so-called Ford act. That law taxes franchise values as real estate. In truth franchise values and land values are synonymous terms, and are ascertained in the same manner. The land value in any piece of real estate is found by subtracting the cost of the improvements from the market value of the whole property. Likewise, to get at the land value in a street railway, it is only necessary to subtract the cost of the improvements and tangible personal property from the market value of the entire property. The remainder left after this subtraction is the selling price of the use of the streets and other lands which may be owned by the corporation. Having thus learned the value of the land monopolized, it only remains for the State to take the royalty in the form of an annual tax, in order to destroy the special privilege and thus prevent the corporation from exploiting the people by heavy fares. That is to say, if rates are kept high, taxes also will be high, and in this way will prevent the incorporators from profiting by their exploitation of the people. The company may continue to demand high rates for passengers and freight, but the sum taken will go into the State Treasury for public uses.

Should one of the States adopt the course here indicated of getting at the franchise values of all monopolies and then derive all its revenue from a tax upon land values, its prosperity would be so augmented as to force the other States speedily to follow its example.

My conclusion is that trusts will not be uprooted and destroyed until deprived of the monopolies now granted them by law. First, the nation must remove tariff monopoly by transferring to the free list trust-made articles; and, secondly, the States must remove land monopoly by transferring the taxes, which now are imposed upon personalty and improvements, to franchises and other forms of land monopoly.

Providence, R. I.

Literature

The Loves of Edwy*

THIS novel sustains the same relation to literature that the funny, pitiful pictures in *Life* do to art. These do not show the idealized forms to be found in great paintings, but they are "Saucy Sorrow" interpretations of life. By a sort of bobtail flourish of the pen the artist gives that shape to the little beggar's legs which makes her at once the object of compassion and amusement. She drags at sorrow with her apron strings, and defies fate with a snub nose and reckless chin.

In such a manner is the heroine of this story introduced. The truth of the conception does not consist in presenting a pattern child; but it is in the sublime unconsciousness of childhood, expressed by the yellow hair tied into a cockade; in the feminine soul portrayed, too young to know the shame of wearing unfashionable garments; in the wit and sweetness suggested by the hoyden innocence of her pose. Later she becomes the pastelle woman, finished with the brilliant accents of beauty and passion. But there have already been too many of these golden lily women in fiction. What we will remember is the funny, pitiful pictures of this little starling of girlhood, Aspasia Jane.

With the hero, however, the author is more successful. Few women writers ever create a real scamp. Their inordinate imagination runs to the heavy villain type. They are unable to produce in masculine form that attractive, immoral levity of the rascal. They do not know his psychic genesis. But in the character of "Juggs" we have a man whose temperament is tender yet conscienceless, whose every virtues were so impulsive as to render him unreliable. In short, the sort of fellow whom men instinctively distrust and women adore, not because he is bad, but because their goodness is composed, for the most part, of maternal compassion. To complete his moral confusion, the "Juggs" type possesses a contradictory knightliness of soul which enables him to die for a poetic ideal where a better man would compromise. It is as impossible to damn such an one as to trust him, and women usually end as Jane did by imploring him to destroy them according to his pleasure. These are "*The Loves of Edwy*," Edwy himself being a sort of bellowing Memnon man, too large and too serious a character for the funny pity pictures in which he appears. The author has illustrated her story even better than she has written it.

* THE LOVES OF EDWY. *By Rose Cecil O'Neill.* Boston: Lothrop Publishing Co. $1.50.

The Pathfinders Again

MR. WHEELER carefully follows the Lewis and Clark expedition on its wonderful journey, explaining and identifying its route, and clearing up a number of disputed points.* He has himself traveled over much of the trail, particularly in Montana and Idaho, and he gives many excellent illustrations of its more interesting features. He has also gathered a great deal of new material concerning the members of the expedition. Despite the generally accepted statement of President Jefferson that Captain Lewis committed suicide, it would appear from the evidence submitted by Mr. Wheeler that the explorer was murdered.

The identification of the route from Travelers' Rest Creek to the forks of the Clearwater is particularly valuable. There has long been matter for dispute as to many portions of this trail, but it is likely that Mr. Wheeler has closed the controversy. Especially notable also is the careful delineation of Captain Lewis's homeward route from Travelers' Rest Creek to the Great Falls and of his dangerous and almost fatal adventure along the Marias River.

* THE TRAIL OF LEWIS AND CLARK. 1804-1904. *By Olin D. Wheeler.* (*With 200 Illustrations.*) New York: G. P. Putnam's Sons. 2 vols. $6.00.

It is remarkable, considering that this journey was made between 98 and 100 years ago, that there should have been found within the present generation any person who remembered it. Yet Mr. Wheeler, with plausible, if not entirely convincing, evidence, records the case of Pe-tow-ya, a Cayuse Indian woman, whom he found at the Umatilla Reservation in 1901, who vividly remembered the expedition. She was then 110 years old, and was thus about 15 when the explorers passed through the region which her tribe then inhabited. Mr. George Bird Grinnell, the noted writer, also records meeting and talking with an Indian who claimed to have borne a historic part in that exploration. This was Wolf Calf, one of the Blackfeet who treacherously attacked Captain Lewis and three men of his command on the Marias. The evidence, however, while satisfactory in the case of Pe-tow-ya, is weak in the case of Wolf Calf.

For the book as a whole there is no word but of praise. Perhaps a trifle too much concerning the wonderful virtues of the Northern Pacific Railway is to be found in its pages, but this is forgivable in view of the patient and conscientious research which it reveals, and of the great wealth of material which it displays concerning what must be considered the greatest exploration of American history, and perhaps of all time.

Trusts

THAT economic Frankenstein monster—the Trust—has become a problem that presses for immediate solution. Indicative of its importance are the volumes of discussion. And varied, indeed, the different and opposing attitudes on this phenomenon. The capitalist believes it an inevitable product of modern industrial evolution and all anti-trust legislation as blind workings against nature; even more, as destructive of all true business interests. This expresses also the position of the Socialist, but to him it sounds the death-knell of modern economic and social conditions. To the average man, who sees in the trust a dangerous monopoly, obversive to his traditional and instinctive idea of "free competition," it looms up as a serious menace to the peace and order of society.

M. Saint Léon* considers it in its historical and comparative phases. The first reaction against competition took the form of pools (*Cartells*)—the form which persists to-day in most European countries. The disadvantages of this form of combination, its looseness and instability, its difficulty in enforcing necessarily secret contracts, tended to the organization of the more solid form—the trust. The latter also has undergone an evolution. Its more primitive form—the trust-certificate corporation—gave way to the consolidation-trust, the most usual up to 1898, and to the holding-trust, generally prevailing at the present day. It is this last form which has received a serious check in the recent Northern Securities decision.

An equally valuable, but more intensive, discussion of trusts in America is to be found in Mr. Montague's work.† A fair presentation of the case for the trusts conveys an excellent idea of their *raison d'être*. That the trust has come to stay becomes patent to every man upon a reading of the savings of combination, the immeasurable benefits in marketing, the lowering and stability of prices, greater output, improved process and higher efficiency of superintendence. The three great evils of trusts in general, and of the present trusts in particular, are, in his opinion, the control of output and of prices, the destructive attempts to break competition, and overcapitalization. Another serious difficulty is presented by the inability of the Federal Government to control the trusts, owing to the inefficiency of the Inter-State Commerce act and the Sherman Anti-Trust law of 1890.

That this inefficiency is unavoidable in the nature of the case is the argument of Mr. Moody.‡ In his introduction to the history of the trust movement in America Mr. Moody frames his definition of the trust, well substantiated throughout this exhaustive study of industrial combinations, as "a combina-

† TRUSTS OF TO-DAY. By Gilbert Holland Montague. New York: McClure, Phillips & Co. $1.25.

‡ THE TRUTH ABOUT THE TRUSTS. By John Moody. New York: Moody Publishing Co. $2.00.

tion . . . formed with the intent . . . to monopolize business, to restrain or interfere with competitive trade, or to fix, influence or increase the force of commodities." In no vague terms does he declare that monopoly is the essence of the trust, or, at least, of the successful one, and that to attempt to interfere with this "natural tendency" must prove "futile and ineffective," as shown by the facts that very few cases against trusts have been successful, and that more than two-thirds of the trusts have arisen since 1898. The major part of the work is taken up with a description and analysis of the different trusts and trust groups. The three great trust groups are Industrial, Franchise and Railroad Trusts, almost practically concentrated in the hands of the Rockefeller and the Morgan interests. Very impressive and instructive are Mr. Moody's figures. A general review of the trust situation and the "so-called remedies" for the "evils of the trusts," pregnant with individualistic *laissez-faire* doctrine, terminates the work.

The opinion of the average man finds expression in Richie's *Trusts versus the Public Welfare*,§ which is a bitter attack upon trusts from every point of view, denying their benefits and exposing their evils. Evidently a hasty production, it is marred by a careless style, with many slips in grammar and with many a sentence that defies comprehension, unless after a time-taking unraveling of the tangled web.

The Problem of Monopoly‖ is a course of lectures to an every day audience, yet containing so lucid, wide and thought-compelling a discussion of the subject is, indeed, a rarity and evidences the skill and grasp of the trained thinker. While Professor Clark does not belittle the trust as an economic force of enduring value, he puts forth a strong plea against trust monopoly as striking at the root of the present industrial system. Free competition is so much in danger, to his opinion, that even government ownership of railroads and mines, while it has its own evils, may justifiably be resorted to. To the farmers' relations with the trust a thoroughly sympathetic and understanding chapter is devoted, explaining a situation in the West very little known elsewhere and throwing light on the erratic and money-mad movements among the farmers.

Books on Russia

THE motto on the title-page of *Russian Affairs* * reads as follows:

"I believe that Russia has a civilizing mission such as no other people in the world, not only in Asia, but also in Europe. . . . We Russians bear upon our shoulders the new age; we come to relieve the 'tired men.'—Count Mouravieff."

The author goes at once into raptures over the "great activity in every part of the vast dominions of the Tsar. . . In the North, the tale of Finnish exiles grows daily longer. . . . In the South, the massacres of Kishineff give one more proof of Russia's determination to achieve at all costs her aim of national solidarity. . . ."

Then Mr. Drage goes on to say that tho all this seems to the Western world a record of political crime and barbarity, to Russian statesmen these incidents are the inevitable steps whereby Russia is advancing on her mission of culture and beneficence.

On page 188 we read that "every sort of device is employed to prevent Jews from obtaining the education which they are so anxious to acquire. If they are willing to establish and maintain schools of their own, permission is seldom granted without a struggle;" while on page 2 the author assures us that "Russia is to bring enlightenment, civilization and faith to China; she is to deliver the victims of British oppression in India; on her own people she is to bestow a new culture which shall be indigenous, a true product of Slavonic genius, far superior to that spurious culture which they have tried to borrow from the weary and effete Western world."

It is quite natural that a book on Russia, written in such a spirit as this, should contain nothing about Russian literature

* RUSSIAN AFFAIRS. *By Geoffrey Drage.* New York: E. P. Dutton & Co. $6.00.

—the only bright ray in the dark land of the Tsar.

Mr. Schierbrand's work† is a sane, unprejudiced, clear analysis of conditions in Russia as they are to-day. The chapter on Russian finances shows wide information and a keen insight into M. de Witte's methods. It is to be regretted that the review of Russia's literature in this volume is so brief and so superficial.

In his concluding chapter Mr. Schierbrand says:

"A crushing defeat for Russia in a large foreign war would be a severe lesson, it is true; one very painful to Russian pretensions, Russian jingo spirit, and in a certain sense to Russian patriotism of every stripe. But, for all that, such a defeat would be a blessing in disguise to the whole nation, drunk with aggressive power as they are, and with a national conscience callous to the best dictates of enlightened humanity and to the unwritten laws of fairness in dealing with weaker but more gifted and advanced races."

Miss Singleton's compilation of extracts from the works of *Great Writers*‡ on Russia is insignificant. The selections will rather confuse than enlighten the reader. The last chapter of the book, that on present conditions, tho brief, is to the point.

New Land: Four Years in the Arctic Regions. By Otto Sverdrup. Two volumes. New York: Longmans, Green & Co. $10.50.

There is something fascinating about the exploration of the Arctic regions. Within recent years we have had many expeditions that have sought to reach the North Pole, and the end is not yet. The severest kind of privations have been cheerfully borne by every Arctic explorer, and many valuable lives have been sacrificed in the oft repeated attempts to find the North Pole. In *New Land* we have a record covering four years, in spite of the fact that no attempt was made to actually reach the Pole. Life on board the "Fram" has been vividly presented, the coast of Greenland has been described, and the author interestingly recounts his contact with the Esquimo and various Polar animals. Some of the sledge journeys taken across the great glaciers are full of adventure, mingled with no little peril. The book records a careful study of vegetation—both the flora and fauna of the Arctic regions. The familiar experiences of our own Peary will be found duplicated in many instances. Mr. Sverdrup frequently lacks the vividness of Jack London, but he has given us a careful description of the beauty of the Arctic night. In all, an approximate area of 100,000 square miles was explored during the expedition described by the present writer. The expenses are given as $60,000 in round numbers. The scientific appendices include some account of the geological survey, a summary of the botanical work of the expedition and its results, the animal life in King Oscar Land and the neighboring tracts, as well as a summary of the meteorological observations made.

The Life and Letters of Robert Lewis Dabney, D.D., LL.D. By Thomas Carey Johnson. Richmond, Va.: The Presbyterian Committee of Publication. 600 pages. $2.50.

The author is not an adorer of Dr. Dabney, but an admirer and a faithful biographer. He has included in his book something which we could wish were not true, but his apology for so doing is a tribute to Dr. Dabney. He relates that when Dr. Dabney's "Collected Discussions" were being brought out, it was suggested that one of the articles would injure his reputation if republished. The Doctor, on hearing this, said: "What do you think of this? Do you like the plan of trimming a man, whose life and work you would perpetuate, to suit your notions, and then handing the resultant down as if it were real?" The answer was made that it was best that "they and he should be handed down as they were, warts and all." He replied, emphatically: "The truth demands it, sir." And so the author has made an effort "to present, as nearly as possible, the genuine Robert Lewis Dabney. Warts and all," he was a commanding figure in the South, and exerted a deep and abiding influence. In all his varied and useful life he was manly, brave, true. The book is well written, and holds the attention from the very start. Students

of our national history might do well to read it, in order to see something relating to our Civil War from the Southern standpoint.

Jeremy Taylor. By Edmund Gosse. New York: The Macmillan Co. 75 cents.

This volume is one of the series "English Men of Letters," edited by John Morley. While we cannot expect that an exhaustive biography of a great man can be compressed within the limits of 228 pages, yet we have here such a life of Jeremy Taylor as makes us feel well acquainted with him. It is a most interesting history of the life and work of a very remarkable man, and the reading public is to be congratulated upon having for its author one who is so appreciative and sympathetic, and, at the same time, so able and discriminating.

The Congregationalist. By Leonard Woolsey Bacon. New York: The Baker & Taylor Co.

Dr. Bacon, as one of the brightest of a very able family of Congregational ministers, has been selected to write this volume on "The Story of the Churches." He has been steeped from his earliest youth in the theology and history of the Churches he describes, and has all the gifts necessary for telling that story. This he has done in a compact and vivid way, to which exception will be taken only by those whose training and sympathies ally them with the teachings of the early times. He regrets more than most Congregationalists do now the Unitarian schism, and is inclined to place the main blame upon the strictness of Congregational theology, which would not allow latitude of faith. To be sure, he recognizes the weakness of Unitarianism, which indeed is writ large in its history. He has very little sympathy with the line of theologians from Edwards to Emmons. He thinks Edwards was wrong in his conflict over the Half-Way Covenant, that Hopkins was a severe doctrinaire who limited the Church, and that the theological influence of Emmons was thoroughly bad, however sympathetic he may have been with the missionary movements of his day. The history of the theological current in New England is inadequately given, and one is surprised to see the names of Nathaniel W. Taylor and Edwards A. Park mentioned incidentally but once and that of Moses Stuart entirely omitted. The later conflict over Andover Seminary and the American Board is not even mentioned. Dr. Bacon is an enthusiastic Congregationalist, who would make the Church very inclusive and break down the divisions which separate it from the less Evangelical denominations. He recognizes the extraordinary influence which Congregationalism has had in American Christianity and education, and is not wholly out of the way in identifying this influence with that which has produced the so-called Americanism in the Catholic Church of America, France and Germany.

The High Road: The Autobiography of an Ambitious Mother. Chicago: Herbert H. Stone. $1.50.

The title of this volume calls to mind "A Match Making Mother," a book that appeared two years ago. This lady married off half a dozen daughters and then capped the climax by marrying herself. But with her match making was a sort of tender passion. She sustained a maternally sentimental relation to every daughter's love affair. But upon this social high road we meet another type in the ambitious mother. She is a West Virginia woman, whose grandfather was a Hard Shell Baptist preacher; but she had the aspiring mind, and having no better standard of excellence, she modeled her life and ambitions to fit the plots she found in English novels. And that is not an unusual pastime for village matrons, but the difference is that this one insisted upon realizing her castles in the air. If she had been born and bred to the inertia of the social world in which she aspired to move, she would have lacked the courage and executive ability for such an undertaking as the marrying of her children to the lords and nabobs of this earth. As it was she carried out her designs with a pluck and shrewdness that command admiration, whatever may be said of her motives. And she proves what a woman can do who is without conscience or sentiment. Incidentally she gives original and vivid impressions of social life in London,

Paris and New York. And she brushes aside forever some illusions parvenus of the West have long entertained concerning certain royal personages. In short, she has made the way as clear for those who would follow after her as if she had written a cook book. But there is one curious quality about the adventuress, she is invariably proud of her success. The villain, man, no matter how brilliantly he plays his part, is secretly ashamed of it. When he writes his own biography he is at great pains to explain and excuse his faults. He charges them to heredity or environment. But the woman is so naturally helpless that nothing is so fascinating to her mind as the ability to accomplish her ends. She is heartlessly happy over the result, and that is really the moral of this book. It indicates the stages through which an innocent, intelligent country woman passed into the social parasite, a criminal in her unscrupulous methods, and a respectable monster of wickedness generally.

Literary Notes

"THE WORLD'S WORK" has issued a double number for August, sold at 50 cents, which gives a more comprehensive account of the Louisiana Purchase Exposition than has hitherto been published. The illustrations are numerous and printed as only Doubleday, Page & Co. can print half-tones. There are some 200 pages of text and as much more of advertising matter quite as readable and attractive.

....A dainty little volume on "The Child's Book-Plate," by Gardner C. Teall, has just issued from the Charterhouse Press. The book contains real book-plates designed by the author, some of which are hand tinted. The following inscription, which is included, seems exceedingly appropriate:

"My little Book!
My little Friend!
I wish you both good-morrow!
But don't forget
I do but lend
The book you do but borrow!"

....Lewis Buddy III (the Kirgate Press, Canton Pa.) has just issued a reprint of Horace Walpole's "Essay on Modern Gardening" The edition is strictly limited to 300 copies, and the volume is in type *fac-simile* of the edition printed by Mr. Walpole at Strawberry Hill, MDCCLXXXV. It is the first reprint since that date. The copper plate on the title page show Strawberry Hill. A pleasing and scholarly introductory note to the present publication has been written by Mrs. Alice Morse Earle.

Pebbles

DOC ROBINSON has bolted Judge Parker: he says Parker bathes too much.—*Atchison Globe.*

....Naturally that regiment of which the baby Czarevitch is colonel belongs to the infantry.—*The Baltimore American.*

....We are proud of only one thing: That we have never let any man decide for us what are the Hundred Best Books.—*Atchison Globe.*

....Now the Czar decrees the total abolition of corporal punishment in Russia; but it will probably still continue in Delaware.—*The Boston Transcript.*

....Dearly Beloved Brethren, the Scripture moveth us in sundry places to make the best of things; that where an evil already exists, it is best, if possible, to replace it with a lesser evil. The bartenders will now pass through the congregation taking orders for pure beer and whisky. So that if any man has a thirst that makes it imperative to go out between the acts, let him remain here quietly and satisfy it. Let us all unite in singing:

There is a fountain filled with beer,
Where thirsty thousands drink,
Where barmaids serve all liquors clear,
And no one tips the wink.

—*Life.*

....The Modern Doctor arrived in his automobile in the nick of time. The patient was getting well. In a couple of days of rest and quiet he would have been all right. "His pulse," said the Modern Doctor, "indicates that streptococci will arrive on the next train and may force an entrance if the doors are left open, and they can get in without registering. His temperature, although normal, is only this way because he didn't expect me, and his respiration shows plainly that he must have been drinking Florida water and swallowed one of the seeds. This is no time, therefore, for child's play. We must remove the appendix at once." "But," said the Modern Patient, "let me understand the precise reason for this thing which I cannot but regard as a serious matter." "Ha! Ha!" laughed the Modern Doctor, "as if, with thirteen more operations to perform before the noon bell rings, I had any time for small talk." So saying, he clapped on the ether bag, performed a few deft movements with the upper arm, and motioning to his private secretary to enter up the amount on his card system, he was off once more.—*Life.*

Editorials

The President's Letter of Acceptance

We can only abstract, in other columns, President Roosevelt's long letter of acceptance, which the daily papers print in full. It is a worthy letter, which we can only characterize here in brief words.

It dodges nothing; it apologizes for nothing. With a proud confidence it lays bare the full record of the Republican Party and its administration for eight years and challenges criticism. It makes no defense, but simply recounts the achievements of the past and dares the enemy to fix blame. It does not attack the policy of the Democratic Party, because it can find no definite, sustained policy which is accepted and defended. How can you attack, except for instability, a party whose members are radically at variance on the most vital issues?

See what are the items in the record of assets which the President records to the country and on which he invites its judgment. There is the Panama Canal, the opportunity seized, the new Republic recognized, the canal made sure and speedy. Criticism can attack the only possible course that would have made the canal possible for years. There is all our foreign policy: the protection of American interests in Turkey; the settlement of the Alaska boundary line; the acquisition of Hawaii; the freedom of Cuba; the protection of American citizens threatened in Pekin; the settlement of troubles in Venezuela; the maintenance and civil government of Porto Rico and the Philippines, and the general upholding of the Monroe Doctrine, and the enhanced strength and honor of the American nation among the nations of the world. Is not all this a record that can, with some pride, be put before the voting citizens of our country?

As to matters at home, we do not think it worth while to repeat the President's unnecessary defense of the pension order, which presumes that a man who has reached the age of 62 is only half an able bodied man physically. Everybody knows it is so. The President's action in the coal strike there is no occasion to defend, for no party would dare to assail it. The New York Democratic platform went further, even to the socialistic limit of demanding that the Government take possession of the coal fields. Nor would any platform dare criticise the successful suit against the Northern Securities Company; and the financial policy is equally beyond criticism, at least by a party whose members are at sword's play with each other. A Department of Commerce and Labor, with a Bureau of Corporations, makes it possible to deal effectually in the future with the trusts. The Administration has treated all men, rich or poor, capitalists or laborers, "whatever their creed, their color, or their birth place, as standing alike before the law" (Chinese excepted!) The Civil Service rules have been extended so that the classified service covers the Philippines, and is wider in this country than ever before.

Then there is the tariff. The President believes in protection as a principle, shows that under it our country has reached phenomenal growth and financial power, argues that it helps all classes of society, proves that the Democrats do not desire or expect any general change of policy, and he shows his favor to certain modifications, where needed, and treaties of reciprocity.

The President does not avoid the question of economy. It has been charged that a surplus of $80,000,000 in 1900 has been changed to a deficit of more than $40,000,000 in the year just closed. That charge does not frighten Mr. Roosevelt. Since 1900 we have taken off war taxes to the amount of $105,000,000 a year, and last year we paid in one extra lump $50,000,000 for the Panama Canal. Further than that, we have added rural free delivery and irrigation expenses. The record is not bad.

We need not dwell, with Mr. Roosevelt, on our retention of the Philippines. We could do nothing else, and we have

done better for them than any other nation ever did for a foreign dependency.

The ethical sense runs through President Roosevelt's letter, as it is the very texture of his soul. He thus puts it: "We have striven both for civic righteousness and for national greatness." He appeals to those "who feel love of country and trust in the uplifting of mankind." And there is in this no cant, no winking at fellow-augurs, but a real and serious purpose which the world must recognize. There is about it a healthy upper breath of vital air.

The Laborer and His Hire

THE newspaper press has shown feelings closely akin to anger over concessions made by the Interborough Railway Company of New York to employees that have been threatening to tie up the elevated railway system.

The company proposed to pay $3.00 for a ten-hour working day to motormen on the new subway trains. Engineers on the elevated have been receiving $3.50 for a nine-hour day. The company held that the work of a motorman on an electric train is less difficult and requires less skill than that of a locomotive engineer, and claimed that $3.00 is the maximum wage for such employment in the United States, except on the New York elevated railroads, where the old wages of locomotive engineers have been maintained for motormen since the substitution of electricity for steam. The newspapers are saying that under present industrial conditions $3.00 is all that motormen ought to get, and that a ten-hour day is not too long, and they attribute Mr. Belmont's "weakness" to "politics."

In every labor dispute that arises there are three parties in interest, and one of the three is usually ignored. The general public—that is to say, all classes, including business men and wage earners other than the quarreling employers and employees in the given case—is the chief sufferer by any disturbance of the regular course of communication, transportation, trade or production. But the interest of the general public finds few champions. This fact is discreditable to the newspaper press, which should stand for the public interest and not for a class.

In this clash of railway employees with an employing company the public interest has hardly been mentioned. That interest in its supreme form is the safety of the millions of passengers that are daily intrusting their lives to the judgment, fidelity and "nerve" of railway employees.

Next to our shameful record of lynching, the appalling loss of life by needless railway and steamboat accidents is the most disgraceful fact in American civilization. Nothing to match it has ever been shown by the railway and steamboat management of other countries. To say nothing of death in other shocking forms, the number of victims burned alive on American railways in twenty-five years probably exceeds the number of heretics burned alive in all the religious persecutions since the beginning of the Christian era.

That a large proportion of these accidents must be attributed to the overwork and unbearable fatigue of railway employees is well known. It has been proven, over and over again, in coroners' inquests, and in suits for damages, and the report of the statistician of the Interstate Commerce Commission calls attention to it almost annually as a great and shameful evil. It is certain that the average human being cannot for many years endure the wear and tear of nerve incident to the life of an American railway employee without danger of fatal collapse at some critical moment. Our life is one of intense strain and rush. We demand fast trains, short stops and a reduction of "headway" to the narrowest margin of safety.

Under these conditions it is either imbecile or dishonest to say that a given rate of wages is as "high as it ought to be" merely because no remarkable skill is demanded, and plenty of men can be had for the job. Technical skill is but one element in the combination of qualities that the railroad demands, and not the most important one. No man is fit to be an engineer or motorman, to take his place at the head of a train, with hundreds of human lives behind him, who has not the sterling moral qualities of responsibility, trustworthiness, instant and unfailing judgment and cool courage. The value of these qualities cannot be measured in money. It should be esti-

mated with an eye to justice and even to generosity, and with some indication that employing railway companies enjoying public franchises recognize their own accountability to the people.

More vital, however, than the question of wages, from the point of view of the public, is that of hours. When the Interborough Company used the argument that most railway employees in the United States are working 12 hours a day, it announced a fact that, if true, should at once be made the basis of legislation in every commonwealth of the United States. If the railway companies of this country are intrusting millions of lives to men that are kept under strain, under existing conditions of railway operation, for 12 hours a day, their directors and managers should be made liable to indictment for felony.

Judge Parker on Editors

JUDGE PARKER may know a great deal about law, but he knows very little about the duty of editors, if we may judge from his address to the Democratic editors who visited him at Esopus last week. He meant his description of the ideal editor to be very complimentary to the four hundred whom he instructed, but it was a mean ideal which he set before them, an ideal of foxy craft, and not of ethical purpose. He said—and we quote all he said on the subject:

"So the great papers are those which anticipate the careful judgment of the majority. The great tribunal of the American people may be implicitly relied on to decide all questions with unerring and exact justice when all the evidence is in and deliberation had, and those who would hold place as leaders of the people must be so thoroughly American, so discreet, so far-sighted and so sure of the pulse of the people as to discern the course public opinion will take. Tho the instant judgment of the people may be often at fault, the ripe and final decision is always for the right. And the part of leadership is to know the right, and to honestly, patriotically, fearlessly and zealously advocate it.

"Just as long as the press can discern and lead the unhurried and well-considered judgment of the people, so long will its power grow mightily, and so long will it hold its place in the front rank of the unfaltering and vigorous march of national progress. To the upbuilding of the power of the press, and to the best use of that power, you have devoted yourselves."

Let us see what he thinks of the editorial duty.

It is, he says, just this, "to anticipate the careful judgment of the majority." Editors must be "sure of the pulse of the people;" they must "discern the course public opinion will take;" they must "discern and lead the unhurried and well-considered judgment of the people." That final judgment will be right, he thinks, always. It may be at fault for a while, but it will always be right in the end. Thus anticipating ripe public opinion they must "fearlessly" advocate it.

What is this but making of the press a political weather bureau? Look ahead, he says; see how the wind will blow in the end, for it is sure to blow right, and trim your sails accordingly, and thus lead public opinion, and you will be "great papers." A more contemptible view of editorship we can hardly imagine. We commend it to the careful attention of those "independent" journals which have found in Judge Parker extraordinary insight and courage.

It is not true that the final judgment of the people, within any period that can be anticipated, will be right. It may be, and often is, utterly wrong. Secession is an example, and the spirit of secession still rules its region after half a century. The "final decision" of great questions of government and religion concludes so far as mere study of "the pulse of the people" can possibly anticipate, and as centuries decide it, one way in England and another in Italy or Spain. Our public opinion is diametrically opposed in all its currents to that of Austria or Belgium, and what is the "part of leadership" to be? It is, we are told, to look ahead, see the current, study the trade wind, and "lead." That is what we call following, with the conceit of leading. It is the part of the bushwhacker who robs and burns ahead of the army; or it is, at best, that of the drum-major who struts before it and imagines himself to be the general in command.

A noble position is that taken by the independent press, but it is not what is described by Judge Parker. It is not watching cloud currents. It has an eternal compass which points fixedly to the polar star. Currents may change, popular opinion may veer, or may settle wrong for secular periods that seem to know no change, but that does not concern the real leader. It is not what the people think, or what they are likely to think, or what they will some day or other think, that he bothers himself with. His question is with the right and the wrong, not the "discreet," not the "judgment of the majority." There are certain great principles of justice, liberty, equality, by which he squares his teaching; and he attempts, succeed or fail, to bring the *vox populi* to his eternal standard. Such men we have had; such a man founded the *Tribune;* such men in our day, to their best understanding accepting strenuous right, have been real leaders, not blown like dead leaves before an advancing gale, but themselves showing the people what is right, directing the course of public opinion, and guiding it in a way which it would not otherwise have taken.

We trust that Judge Parker believes better than his bungling words express. It is the second time he has bungled; he had to correct his language about self-government in the Philippines. We should be very sorry to believe that he is only a weather-vane stuck very high in the air, in search of the topmost current.

"They"

KIPLING'S latest masterpiece in the August *Scribner* arouses so much discussion because it is essentially undiscussable. It may be felt by some, but interpreted to others by none. Only those who have suffered can see.

Kipling never strikes twice in the same place. When he has made one reputation he sets out to make another. But this is not the first time he has mingled without incongruity, the practical and the mystical, and made the prosaic transparent to the poetical. If any one save Rudyard Kipling attempted to write the Odyssey of the Automobile we might fear some frozen mechanism—a thing of steel and cogs and wheels. But the wizard touch does not fail him—or us, and in the exquisite half-light of his imagination we see the lovely little people who throng the enchanted grounds of the children's castle he builds for us.

Only they who have had children of their own, have loved them and lost them are fit to walk in these holy places of memory and imagination. That a motor-car, the epitome of all that is practical and prosaic and matter of fact, should be chosen as the vehicle to transport us through this mystical land is one of Mr. Kipling's paradoxical triumphs, justified by genius. It is a real automobile, touring through an unreal world of fancy. The mystic garden; the sightless maiden, who stands in her loneliness for all unsatisfied motherhood; the poignant pleasure of half-seeing, half-divining the presences; "They" who lurk in feathered nooks of fern and forest, and who flee at a look—one fears to touch the unfurled velvet of this half-unfolded flower.

Here is not the trumpet voice of the poet Laureate of Imperialism, this is the Kipling who wrote "The Brushwood Boy." The touch of supernaturalism does not offend—for sweeter spirits than these vanishers never lived in fairyland or love. We hear the whispers of their childish secrets, the soft footfalls of tiny feet, the stir of gliding garments as we read, and at a touch like this the heart stands still:

> "The little brushing kiss fell in the center of my palm—as a gift on which the fingers were expected to close; as the all-faithful half-reproachful signal from a waiting child not used to neglect even when the grown-ups were busiest—a fragment of an old mute secret code devised very long ago."

Who does not remember some especial mark of favor or affection "They" used to give us long ago? Who cannot recall some grace or charm, now vanished, in which "They" were not like other children? And it is like the very "parting of flesh and spirit" not to linger near the threshold where we can almost see "Them;" to heed the call of duty summoning us elsewhere, to be willing to wait until "They," or we, perhaps, are no longer shadows.

The Inter-Parliamentary Peace Congress

Our readers will recall that for the past year we have published occasional articles by Mr. Horne Davis on the organization of a world wide Government, and elucidating the subject from time to time in our editorial columns. It is the very line of the purpose of these discussions that the Interparliamentary Peace Congress meets this week in St. Louis. The Hon. Richard Bartholdt, chairman of the Joint Committee of the Senate and House for Receiving the Parliamentarians, has given out an interview, in which he says that the conference at St. Louis will be asked to make a stand for the things they foreshadowed, and particularly to pass a resolution requesting the President of the United States to invite all other nations to send delegates to a conference, empowered to negotiate arbitration treaties, and to discuss the creation of a Congress of Nations.

Mr. Bartholdt has given cogent reasons why the United States should be the nation to take the initiative in thus perfecting, in its likeness, the existing Union of Nations, and why the meeting of this conference at St. Louis is the critical time for practical action in this direction.

All nations will be there, exhibiting on their commercial side their means of serving each other in material things. This Exposition is itself a proof of the perpetual interdependence of all peoples.

When the delegates to this Interparliamentary Union take their seats in conference, every one of them will be in the midst of a country among whose people are a substantial body of his own countrymen. Each of them has simply followed to the United States a stream of people from his own land. There is no other country in the world of which this is true. The United States is to the nations what the ocean is to the rivers of the world, the place where they are all made one. Under such circumstances these Parliamentaries from nearly every nation will be assembled to celebrate the peaceable transfer of the heart of this continent to the human race, for its transfer to the United States was a transfer to the race; also the creation of this nation and its demonstration of the fact that all races can be united under one Government and accomplish wonders, if the Government is rightly formed, and all are given due voice in it.

These members of National Parliaments have come from various parts of the world. None of them come from a place where it has been found possible to preserve peace between contiguous independent political bodies. War has periodically broken out everywhere except within the limits of an organized political authority, and occasionally within such bodies. Conscious of the fact that war between the nations they represent must continue to break out until all nations are permanently united on the basis of one union, what will the European Parliamentarians say to America's resolution that all nations become members of one Grand Republic, completely organized with both Congress and Court, very limited in authority at the beginning, but so formed that it can grow in power as it grows in years? We believe that the hour will have struck for taking this practical step toward the realization of man's highest possible political ideal.

It is not without significance that this conference convenes just three hundred years after Henry the Great of France conceived this idea of a political system co-extensive with France's widest commercial activities. The occasion seems to invite the delegates from France to do more than follow in the practical realization of this grand conception of their greatest King. But the great question is not who shall lead and who shall follow, but that all nations shall rise to the hight of responding to the call of the twentieth century for organized peace and a Parliament of the World.

The Intellectual Side of the Exposition

The Louisiana Purchase Exposition has been from the start very greatly handicapped by insufficient and inefficient advertising, and this is particularly deplorable in the case of its international congresses. Only a very small propor-

tion of those who would be interested in the Congress of Arts and Science to open at St. Louis September 19th have been made aware of its character and importance. The American people are, however, so deaf to anything but loud talking that nothing less than red and yellow circus posters proclaiming it, not untruthfully, as "the most stupendous aggregation of living talent brought under one canvas in this country" would be necessary to bring the general public to a realization of their opportunities.

As a nation we are giving our guests very shabby treatment. The delegates of the legislative assemblies of all the nations of Europe have journeyed thousands of miles in order to come personally into touch with our Congressmen for the discussion of matters of common interest, and only a few of our statesmen can be induced to take a day off to meet them. The Society of Chemical Industry, which includes among its 4,000 members the most important manufacturers of the world, visits our commercial metropolis and the Mayor of New York refuses to receive them, either personally or by delegate. The Premier of England delivers an address on the constitution of matter before the British Association for the Advancement of Science; the President of the United States cannot interrupt his vacation or his campaign long enough to say "Delighted to see you" to the assemblies of distinguished statesmen, scientists and men of letters now visiting us.

The International Congress of Arts and Science at St. Louis is intended to be entirely different from such assemblies in the past. The plan, which is largely due to Professor Münsterberg, of Harvard, has been very sharply criticised on the ground of impracticability, but its aim is certainly a good one. Its purpose is not the advancement of science, but its unification. The papers are not to be reports of new discoveries, but are to give the recent history and present state of each science, and especially its relation to the others. In this way it is expected to overcome in a measure the evils of the extreme specialization now so prevalent.

It will be seen from this that the Congress will interest a much wider class of people than the ordinary scientific meeting. Instead of a hap-hazard collection of technical papers, important and trivial, on all sorts of subjects by all kinds of men, we will have at St. Louis the systematic reports from every department of human knowledge by the most competent scholars who can be obtained from any part of the world. There are seven grand divisions, Normative Science, Historical Science, Physical Science, Mental Science, Utilitarian Sciences, Social Regulation, Social Culture. Each of these will be the subject of an address by an American scholar, and followed by addresses, also by Americans, on twenty-four departments into which science is still further subdivided; one address being given in each department on fundamental conceptions and methods and the other on the progress of the last century. On the four remaining days of the Congress 128 sectional meetings will be held, at each of which at least two papers will read, chiefly by foreign scholars.

Let no one be deterred from attending some of these meetings by the thought that he can read the reports later in the volumes to be published, for even in this age of print the power of the bodily presence and the living voice has not lost its importance. It is true that no definite relation has been established between physiognomy and intellect, and it does not add much to one's knowledge of a subject to see that one of its masters is tall or short, is baldheaded or gray, has a pointed beard or is smooth shaven, but it gives a greater interest, a sense of reality, to see and hear the men who are doing things; the men whose personalities are molding the thought of to-day and forming the concepts and creating the language of the future; men who have annexed provinces of human thought more important than the Louisiana Purchase, and have contributed more by their discoveries to the wealth and happiness of the millions than the event which the Exposition at St. Louis commemorates.

The list of the four hundred scholars who have been invited to take part in the Congress is too long to publish. The names mean either much or nothing to the reader, but all will recognize the exceptionality of the opportunity which enables one to hear within a few days

such men as Josiah Royce and Borden P. Bowne on Philosophy, Wilhelm Ostwald and Benno Erdmann on the Methodology of Science, Woodrow Wilson, Andrew D. White, W. W. Rockhill, Arminius Vambéry and John P. Mahaffy on History; Francis A. March, Friedrich Delitzsch, Paul Haupt, on the History of Language; Basil L. Gildersleeve, Charles R. Lanman, A. W. Jackson and F. Brunetière on the History of Literature; R. B. Richardson, Adolph Fürtwangler and John La Farge on the History of Art; Edward Hopkins, Hermann Oldenberg, Maurice Bloomfield, Karl Budde, Benjamin W. Bacon and Adolf Harnack on the History of Religion; J. J. Thomson and Sir William Ramsay in Physics; Henri Moissan, Rudolf Fittig, J. H. Van t'Hoff and W. O. Atwater on Chemistry; Thomas C. Chamberlain, Nathaniel S. Shaler, Sir Archibald Geikie, Svante Arrhenius and the Prince of Monaco on the Sciences of the Earth; Jacques Loeb, Hugo de Vries and H. H. Donaldson in Biology; Harold Höffding, James Ward, G. Stanley Hall and Pierre Janet in Psychology; Franklin H. Giddings, Jean G. De Tarde and Harold Westergaard in Sociology; Ronald Ross and Nicholas Senn in Medicine; G. Marconi and Michael Pupin on Electrical Engineering; James Bryce and Paul S. Reinsch on Administration; Baron d'Estournelles de Constant and Philipp Zorn on International Law, and C. Lombroso on Criminology; not to mention the "citizens on foot." The full program, from which these names have been almost casually culled, may be obtained without charge from Howard J. Rogers, Director of Congresses, World's Fair, St. Louis.

Coming Home

We are coming home again, as the bees fly to their hives before a shower, and, like the bees, most of us have a load of honey, or at least some pollen of experience. It is a good thing, even if it has cost a good deal of labor and money, to have had a vacation. Down the mountain sides, in from the seashore, away from the lakes, and out from thousands of farm houses, the flight is in flocks and in swarms—homeward bound. Home was never so sweet as after an absence of a few weeks. How good the old door knob feels. The very musty smell that has accumulated in the closed hall rushes out to greet us. We noted the weeds in the pathway, and now we are conscious that indoors as well as out there is an accumulation of things that must be attended to. A locked up house contains a sort of activity. Many things have gone on in here since we turned the key and our backs. Our mental memoranda is accumulating fast, before we get into an easy chair, and fling down our bundles, with "Thank the Lord; back again!" Mind you, even Paradise would grow dull if you were everlastingly shut up in it. Golden streets would be gladly exchanged for a bit of turf and mellow garden soil. The fact is we cannot rest until we have got at our work—at least we must empty our brain cells of accumulations.

The old duties which had become monotonous and heavy are now once more become delight. Green gages and magnum bonums cover the grass, and the apples have drunk so many showers and so much sunshine that they look at us with evident desire to be picked and put away to rest. The summer strawberries carpet the ground with crimson, while the Bunker Hills suggest a month of puddings and pies. The last blackberry is gone from the bushes, but a few white grape currants still welcome our greedy hands. Query: Why does fruit away from home never taste like that plucked off our own vines and trees? Mem.—never to be away again from home when blackberries are ripe. "A blackberry pie," says Old Humphrey, "is ye very highest achievement of ye kitchen laboratory."

The vegetable garden is a sorry sight. What can be more dismal than a potato patch, with wilted vines mixed with weeds, and waiting to be dug? Get your digger and at it, for what can be finer than a dish of Snowflakes, well boiled in salted water and "dried off" as our mothers did it, till the skins burst open and the heart of the potato throbs with benevolent pulsations. It has done its duty under the soil all summer, and now it is going up to accomplish a higher mission of life. "Matter," says Cole-

ridge, "is always climbing;" from the cell of the bean to the cell of the brain. It is the same instinct that makes the vine climb up and the tree lift itself, year by year, into light and sunshine. One rather enjoys a good home-made back-ache after a month at a "resort," where sport and rest become the tedious law of existence, and everybody grows to be so near like everybody else, with golf sticks and tennis racquet, as to lose individuality. There is little left at such a place but to grumble and growl to make you distinctive. After all, there is nothing quite so fine as work. The sensation of having your own private duties to do makes you self-respectful. Editorially we are proud of the potatoes we are digging. "Come," said Diocletian, "Come and see my cabbages."

No one ever yet valued home too highly, and few have comprehended the full duty and possibility of home-making. The highest idea of God is Father—of Heaven is Home. Our homes are buds of an infinite home—the concentered thought and sentiment which has blossomed into our human hope of an eternal homing. It is not a narrow thought, but broad, full, aggressive and growing—an evolution without end. A narrow theology gives us a meager conception of the future; a mean home spoils this life. The highest ambition of man or woman, and of both together, is a fine home—a home full of beauty, truth and goodness.

Coming out of the woods, and shaking off the scarlet leaves of the sumach and the golden leaves of the butternut—or if it be from Chautauqua or Greenacre—we are in no mood to moralize. The joy of existence compels activity. We only feel compelled to make life sweeter, richer and more honest. We shall need other vacations, but they shall all send us back stronger for manly ideals to be worked into home life. The day is coming when society will be able and willing to cast off its trivialities and conventionalism, in order to work in the divinely human. Then we shall hear no more about strikes, and divorces, and anarchism, because our ideas of human life are revolutionized.

We said, like the bees; and that is true. It takes them some time to remove the pollen and disgorge the sweets they have collected. By and by you will find fine combs full of honey. It will be many weeks before what we have gathered of wit and wisdom may have been worked over into overflowing honeycombs, into our public or domestic duties, and brightened firesides and enlivened households. Not one but will be the better for an outing, yet the one settled conviction that seems growing on the American people is that our homes are too artificial and conventional—that they need not be so far from nature as they are. We flee to the woods for a part of the time because we are naturally barbarians. Civilization that is not an improved barbarism is a burden and will be got rid of. Our homes are too complex; our cities too far from the groves; our lives too far from simplicity. Half our social life is artful and soulless. It naturally and easily drops into intemperance and falsehood. The part of good citizenship is to help toward a clear-visioned and cleaner-hearted home. Who shall dream the ideal? Who shall dare to live the real?

The Ideal of Great Nations

Is it true, what the *Athenæum* says, in a discussion of the passion for liberty in Swinburne's earlier poetry, that "liberty is no longer a war-cry or even a shibboleth;" that "freedom is a shadow of a shadow;" that "force is the fashionable god, and force in alliance with avarice is the highest ideal of great nations;" that "utilitarian ambitions have swept aside the misty ideals of universal brotherhood;" and that "nations fight for markets rather than for holy places?" While the writer was penning these lines he might have seen thousands of Englishmen arrested because they would not yield their religious liberty; all Scotland stirred because the highest court put the rights of property before the rights of conscience, and $300,000 immediately given to tide over the loss. He might have looked to see the party in power beaten over and over again by the cry of free education, temperance and free trade. It sounds like the wail of some senile conservative, who has lost the fervor of young enthusiasm

Far better was Browning's outlook, not discouraged when the sonneteer of French and English liberty turned Tory with his Poet Laureate's tierce of canary, but shouting his defiance, faith and grief:

"We shall march prospering, not through his presence;
Songs may inspirit us—not from his lyre;
Deeds will be done, while he boasts his quiescence,
Still bidding crouch whom the rest bade aspire."

If one cares to see the expression of the higher ideal in national life, let him read President Roosevelt's letter of acceptance this week.

A Prophetic Acrostic

Is it generally known that the Japanese are the descendants of the lost ten tribes of Israel? At least that is what the Jews in Jerusalem are saying, and the victories of the Japanese over the Russians greatly delight them. The Talmud tells us that there is a certain sabbatical river which on the Sabbath rests from throwing up stones, and on its banks the ten tribes have enjoyed long rest. The river is supposed to be in Japan. Besides, there are prophetic passages which are clear on the subject. One of these is Is. 62: 4, which reads: "For the day of vengeance is in my heart, and the year of my redeemed is come." This passage is enlarged by making each Hebrew letter the first letter of a selected complete word—that is, making *r* stand for *Russia,* and *J* for *Japan,* when the passage reads thus:

"All Israel shall perceive and shall know the downfall of Nicholas, the Czar of Russia, at the time of his warring in the war of Japan; and after the year of his downfall there shall be true redemption; and it shall be announced to all Israel by the hand of Elijah the Prophet."

Here is a study in acrostics for students of Hebrew, for whose benefit we preserve the original text. We commend the prophecy to Elijah at Zion City.

The Strange Beck Case

The case of Adolf Beck is likely to lead to some very desirable reforms in criminal procedure in Great Britain, and it has suggestions for this country. One John Smith was condemned in 1887 for frauds on seventeen women, and was condemned to five years penal imprisonment. Nineteen years later a precisely similar series of frauds was committed, and Adolf Beck was accused of them, it being charged that he was identical with the aforesaid John Smith. He was innocent, could have proved, if permitted, that he was not Smith, but was railroaded through by the police and condemned to seven years penal servitude. He served his time, was released, and was again arrested when similar new frauds appeared. The jury convicted him, but the judge reserved sentence. Just then the real John Smith turned up, inquiries followed, and Beck was pardoned and $10,000 offered him as a sort of reparation. But he refuses to be silenced, demands full examination, and the Government has been forced to appoint a Commission to investigate the evil. In this country there seems to be plenty of delay and opportunity for an accused man to prove innocence, if he has money; but there is no redress for one who has proved that he has been unjustly condemned and imprisoned. This needs reform.

Good Methodist Church Actions

We have observed that somehow it is the Southern Methodist Church that seems to lead the way toward justice and fair treatment of all men in the section where that Church is strong. We have seen plenty of words, but nowhere have we seen definite acts more hopeful than those taken by the Southern Methodist Church in Statesboro, S. C., in reference to the lynching which took place there lately, when the sheriff and the militia showed such cowardice. The church has passed unanimous resolutions calling upon any of its members who participated in the lynching to resign from the Church, unless "a public confession of wrong be made, with expression of sorrow and contrition." The pastor of the church, the Rev. Whiteley Langston, had the courage to give to the Governor's Commission of inquiry the names of several of the lynchers, and he has been strongly censured for it, but the church has voted to commend him for his "Christian conduct."

We have not expressed the opinion that Great Britain was guilty of selfish Imperialism in sending an expedition to Tibet. It is not easy for us to say that the refusal of the Tibetan authorities to carry out the terms of the treaty was not reason enough to resort to force. Now the treaty is signed, and Colonel Younghusband returns to India, not annexing Tibet by any means, but at least opening it up to trade. It is good for the world, good for Tibet, that the expedition has taken place. Of course, it is fortunate for Great Britain in this affair that Russia was occupied with Japan, and it was good statesmanship for England to take advantage of the time when Russia could not interfere. With the Dalai Lama fled to Mongolia, where the Russians will take care of him, and the rival Lama in rule, we may expect a happy revolution. The Dalai Lama is the thirteenth incarnation, and there is an old popular saying in Tibet that there would be but thirteen incarnations. As with other practices that mimic Christianity these Buddhists seem to have Saint Malachy prophecies and unlucky numbers.

Do our readers know what is, educationally, the best State in the Union? It is Arkansas—at least so says Governor Jeff Davis, in his address to voters before the late election:

> "We have the best public school system of any State in the Union. We pay as much for the education of negroes in Arkansas as does Massachusetts for the education of white children. Our system of public school education is almost perfect in its every detail."

Our readers will please excuse us for not putting this in the column of "Pebbles." Massachusetts expended in 1902, by the last statistics published by the United States Bureau of Education, $38.21 per capita of school attendance, and Arkansas $7.41. The Massachusetts school year was 185 days, and that of Arkansas 91.5. The average number of days attended by each pupil in Massachusetts was 146.6, and in Arkansas 57.5. The average monthly salary of male teachers in Massachusetts was $140.94, and in Arkansas $36.17. "Almost perfect," "best in the Union!"

It is in discussion of Lord Hugh Cecil's proposition to increase the duties of the House of Lords that *The Guardian*, the leading English Church of England paper, remarks that "at present a very moderate share of ability is sufficient to bring a peer to the front, and steady application will do for him what can only be accomplished in the Commons by an unusual combination of qualities." This is a remarkable confession, and reminds one of the old tale of the man who urged his father to come West, because in the border States mighty mean men could get elected to Congress.

Here is a case of conscience which we refer to those who are wise. There was a smoke seen issuing from one of the entrances to the new subway in this city. As it increased the crowd gathered so close that the police could not beat them back to make room for the fire engines that were coming. Then one of the policemen shouted out, "Back there, for your lives! There's half a ton of dynamite below!" and the crowd ran back, and there was no dynamite. Now, when he makes confession to the priest, what sort of a penance would an expert in "moral philosophy" impose?

Rear-Admiral Watson, after a distinguished career, retires at the age of 62. If he had been in the army he could have remained in active service two years longer. The Japanese seem to know how to run a war, and of their two field marshals one is 65 years old and the other 66. General Nodzu is 63, and General Kuroki is 60, while General Oku is 58.

What education is doing for England and Wales is shown in the fact that the last year out of 1,000 marriages only 23 grooms and 26 brides were unable to sign their names to the registers. Fifty years ago the numbers were 305 and 446 respectively. Such a showing ought to shame even the confirmed grumblers against the times.

Careers for the Coming Men: Life Insurance

An attractive little book has just been issued through the Saalfield Publishing Company of Akron, O. It is entitled "Careers for the Coming Men," and contains chapters by twenty-three prominent business and literary men. The chapter on Life Insurance is by the Hon. John F. Dryden, United States Senator and President of the Prudential Insurance Company of America. According to Mr. Dryden life insurance is a marvelous business in that, while practically unknown in this country a hundred years ago and of insignificant proportions even fifty years since, it has progressed to such an extent as to be of the greatest importance in this day and generation.

Some idea of the magnitude of the business of life insurance may be gathered from statements appearing in Mr. Dryden's chapter, which give the total annual income of all the life insurance companies as more than $500,000,000, while the surplus to policy holders exceeds $300,000,000. In the business of life insurance there are many opportunities for young men both in office and field work. Office work is very similar to office work in other industries, but in field work there is large opportunity for the development of individual talent. Very little technical education is required for industrial field work, and the chief elements of success are energy, tact and integrity. The opportunities for advancement are more rapid than in other lines, such as banks, railways or other financial and commercial enterprises.

The demand for young men of exceptional ability is out of all proportion to the available supply, and there is an abundant field for the profitable employment of large numbers of college bred men or men of higher education. The chapter closes with the statement that it would seem to be a perfectly rational view that the intelligent, industrious and tactful young man is not likely to be in error in making a choice of life insurance as a business career.

The stability, thrift and prosperity of a community is fostered by life insurance. The insured man is both strengthened and fortified by it and cannot help being a better man than is his uninsured brother. His policy gives him a personal interest in the insuring company and tends to interest him also in the welfare of the community in which he dwells. He takes part in influencing national conditions for, rather than against, prosperity in so far as he can and with his insurance is apt to consider things more broadly. The insurance he carries may even influence his vote and in every way his insurance is constructive rather than destructive. The whole community is benefited, and the citizenship of the insured man, both at home and abroad, cannot help being of a higher type.

During the present year the Canadian Post Office Department has inaugurated a system of insuring valuable letters. Only regularly paid letters are insurable and the person insuring such letters must pay a charge of five cents for registration as well as a fee varying from three to six cents, according to the value of the insurance taken out. The fee for a letter carrying an insurance of $10 is three cents; for $15, four cents; for $20, five cents, and for the $25 maximum, six cents. This would make the total cost for insuring a letter valued at $25 which was not over weight thirteen cents. On payment of this sum the person mailing the letter receives a special receipt from the postmaster, and the insured letter is shown to be of value by a red seal which is affixed. Special precautions are taken under regulations covering such transactions in order to guard against the possibility of the letter breaking open and the valuable contents dropping out. Thus a letter tendered for insurance under the Canadian system must be inclosed in a strong envelope, properly sealed with gum or wax. Coins, jewelry or precious stones and the like must be inclosed in stout boxes and packed in accordance with specific directions furnished upon request by the postmaster. It would seem that a similar system might well be applied to United States mail.

Financial

Entertaining Bankers

INTERESTING SIDE LIGHTS ON THE WAYS AND MEANS OF OBTAINING BUSINESS ON THE PART OF METROPOLITAN BANKS.

RECENT statements in the daily press are to the effect that a certain bank had made an appropriation of not less than $10,000 for the entertainment of visitors to the thirtieth annual convention of the American Bankers' Asssociation, which began in this city on Wednesday of this week. Other city banks doing an out of town trade, not to be entirely outdone in this regard, arranged to give their banker dealers luncheons, carriage drives and theater parties. The *Evening Post* estimates that banks in Manhattan will have spent between $100,000 and $200,000 in seeing that visiting bankers are entertained during their three days' stay in New York City. This is considered a perfectly legitimate method for a bank to use in seeking to obtain business.

One officer of a Wall Street bank stated in a published interview that with three or four thousand out-of-town bankers in the city we have to give them a good time and, incidentally, strengthen connections in a business way. By meeting a delegate at the station and providing a handsome carriage for his transportation to the hotel, and seeing that his wife and daughters receive flowers and courteous attention as soon as they are comfortably located, you can sometimes secure a $500,000 account. At all events, attention of this kind will interest him far more than the conventional letter, no matter how carefully written, in which your surplus and heavy capitalization are set forth, no matter how seductively.

So far as security is concerned, every country banker knows that any one of the large Wall Street banks could render him satisfactory service and carefully execute his banking business. Other things being equal, the out-of-town banker naturally selects as his Eastern depository the bank that treats him best. Sentiment plays a part in banking as it does in any other class of business, and sentiment has more to do with the selection of a New York correspondent than some people are inclined to suspect. The entertainment of bankers by other bankers certainly has a business end, but this is not so apparent as to lessen even in small part the enjoyment and good fellowship that spring out of it.

A REDUCTION of $5 per ton has been announced by steel tube manufacturers.

....Revised estimates of the wheat harvest indicate a reduction of 67,000,000 bushels in spring wheat prospects.

....A largely increased iron output was a trade feature of last month. Sixty-three thousand tons in excess of July's production was noted in the blast furnace reports.

....Thirty-eight national banking associations were chartered during the month of August. The total capital stock of these institutions was $1,532,000.

....From the records of the Sub Treasury it would appear that the amount of money so far transferred for crop moving this year is somewhat in excess of the sum required for the same purpose last year.

....The striking Ohio coal miners in sub-district No. 6, after having lost something like $3,200,000 in wages, have finally concluded to declare the strike off. According to dispatches from Zanesville they have now agreed to accept a wage reduction of 10 per cent. less than that received for two years prior to April 1 of this year. The strike originated because of a request that they accept a greater reduction than that contained in the Indianapolis convention agreement.

....Dividends announced:

Manhattan Railway Co., quarterly, 1¼ per cent., payable October 1st.

New York Dock Co., Preferred, 1 per cent., payable October 15th.

The Independent

Vol. LVII NEW YORK, THURSDAY, SEPTEMBER 22, 1904 No. 2912

Survey of the World

The Field of Politics

At the election in Maine, on the 12th inst., the Republican nominees had a plurality of a little more than 27,000, which may be compared with 33,000 in 1900, 48,000 in 1896, and 12,500 in 1892. A heavy vote was polled. The plurality largely exceeded the preliminary estimate of the Republican leaders, which was from 15,000 to 18,000. In the number of votes cast the Democratic increase since 1900 was much greater than the Republican, but the Democratic total was less this year than in 1892. The Republicans appear to be well satisfied with the result, but the Democrats also find cause for encouragement in the large addition to their voting force, which may be due chiefly to the return of Gold Democrats to the party. In the Legislature the number of their Senators is increased from one to four, and the number of their Representatives from twenty to thirty. The four Republican Congressmen were re-elected by pluralities ranging from 5,000 to 7,000. Local Democratic victories indicate a growing opposition to prohibition. In Senator Frye's county (Androscoggin) all the county officers will be Democrats, and among those defeated was the sheriff, a Methodist minister who had rigidly enforced the prohibitory law. In Cumberland County, however, which includes Portland, a Democratic sheriff who had permitted the sale of liquor under restrictions was re-elected by an increased plurality.—With extracts from the forthcoming Campaign Textbook of the Democratic party, the editor of it, Mr. George F. Parker, has given to the press the following letter, addressed to him by Judge Parker on August 17th:

"The *Times* of this morning says that the party textbook is about prepared, and that it will go to the printer in a few days. Therefore I hasten to beg you to see to it that there is no word in it that reflects upon the personal honor and integrity of President Roosevelt. An *Evening Post* editorial indicates that but little care was taken in that direction toward myself by the compiler of the Republican textbook, but let there be no rejoinder in kind or otherwise. I feel confident that you need no reminder, still my anxiety impels me to send this caution."

Judge Parker has been urged by Democratic journals to make public addresses. It is said that he has reconsidered his original determination and will make speeches in New Jersey, Connecticut, New York and Indiana. He has been told that his home in Esopus is almost inaccessible. Therefore he has decided to spend a part of the time in New York. He visited the city last week and was in consultation with many prominent Democrats, some of whom may have repeated to him the complaints of leading Gold Democratic journals as to a lack of vigor in his campaign and the failure of the party's committees to make effective use of such issues as the tariff and reciprocity. It is announced that Senator Gorman will remain in New York hereafter, taking an important part in the management, but acting in an advisory capacity, and not superseding Chairman Taggart.—The Reform Club has addressed a letter of inquiry to the Democratic editors of the country. About seven-eighths of the 812 answers received express a desire for tariff revision and for a use of the tariff question in the campaign. The Parker Constitution Club of New York has issued a long statement concerning the President's pension

order of March 15th last, which, it says, was "unconstitutional, lawless and most reprehensible."—Ex-Senator Jones, of Arkansas, Chairman of the Democratic National Committee during the Bryan campaigns, sharply attacks the Populists and their candidate, Mr. Watson, asserting that they are working in the interest of the Republican nominees. They are spending "plenty of money," he says, and he has "a pretty strong idea as to where it is coming from." A natural inference is that he believes it comes from Republican sources. "Mr. Watson's purpose," he adds, "is to assist the Republicans." He denounces as absolutely false "the cheap and contemptible charge that Judge Parker is dominated or controlled by corrupt Wall Street elements."

State Conventions

The Republicans of New York have nominated for Governor Francis W. Higgins, now Lieutenant Governor, who was for several years a prominent member of the State Senate. Ex-Secretary Root had positively declined to be a candidate. Mr. Higgins appears to have been the choice of Governor Odell, chairman of the State Committee, who has superseded Senator Platt as leader of the party and "the organization." The convention was marked by some bitterness, owing to a contest between the old leader and the new one. Senator Platt's candidate was ex-Lieutenant Governor Timothy L. Woodruff, whose friends publicly asserted that the convention was not a free and "open" one, but was controlled by Governor Odell, who feared, they said, that Mr. Woodruff, if elected, would be Governor in fact. Before the roll call, Mr. Woodruff withdrew his name and moved for the unanimous nomination of Mr. Higgins, whom he heartily commended. The nominee has accumulated a fortune of several millions in the grocery trade, in mining and in the lumber business. Democratic journals assert that the work of this convention has given their party an inviting opportunity. The leading candidates for the nomination to be made at the approaching Democratic convention appear to be F. M. Shepard, John B. Stanchfield and District-Attorney Jerome. Among those who have declined to permit a use of their names are Daniel S. Lamont (formerly Secretary of War) and Judge Cullen, who has been nominated by the Republicans, as he probably will be by the Democrats, for Chief Judge of the Court of Appeals, the office recently held by Judge Parker. At the suggestion of Judge Parker, it is said, William B. Hornblower has been selected for temporary chairman. It is recalled that, some years ago, David B. Hill, then a Senator, defeated the nomination of Mr. Hornblower (by President Cleveland) to be a Justice of the United States Supreme Court. It is not expected that Mr. Hill will control the coming convention.—In Massachusetts, Richard T. Olney has refused to be a candidate for Governor, and Colonel Gaston declines to run again.—The New Jersey Democrats have nominated for Governor Charles C. Black upon a platform demanding the local taxation of railroad and canal property at the rates imposed upon ordinary real estate, and the taxation of the franchises of the railroad and canal companies by the State at the rate of ½ of 1 per cent.—In Colorado, the Republicans have renominated Governor Peabody. Their platform commends his course with respect to the labor controversies, and favors an eight-hour law.—The withdrawal of Mayor Fitzgerald, of Pawtucket, from the field, in Rhode Island, clears the way for the renomination of Governor Garvin. The Legislature, summoned in extraordinary session by him, met on the 13th inst., and defeated his purpose by adjourning on the same day, after passing a resolution in disapproval of his action. He desired the passage of bills providing for the initiative and referendum (with special reference to a change in the present system of representation) and strengthening the laws against the bribing of voters.

The Prosecution of Lynchers

In Alabama, Georgia and Mississippi the authorities are now attempting to punish persons who took part in recent lynchings, or who as members of the militia failed to defend prisoners

against lynching mobs. Horace Maples, a negro who had murdered a white peddler named Waldrop, was taken from the jail at Huntsville, Ala., on the 7th inst., and hanged. A special grand jury has now indicted 19 persons who participated in that lynching. Four of the indicted men have been arrested. One of them is the proprietor of a hotel. These men are in the jail, which is guarded by two companies of militia, instructed to resist any attempt to rescue the prisoners. An inquiry as to the conduct of the militia at the time of the lynching is to be made by a military court. It was reported that the grand jury had indicted the Mayor of Huntsville and the Sheriff of the county, but it appears that the jury only asked the court what steps should be taken to procure the impeachment or removal of these officers.—Governor Terrell, of Georgia, has ordered the trial by court martial, in Savannah, on the 29th, of all but one of the officers of the militia stationed at Statesborough when the two negro murderers, Reed and Cato, were taken from the Court House (after conviction and sentence) and burned at the stake. A board of inquiry reported that the troops could have taken the negroes from the mob while they were on their way to the forest. The Governor promises to request the Attorney-General to assist in the prosecution of the lynchers if a grand jury will indict them. The Methodist Church at Statesborough has called upon members who took part in the lynching to resign or make public expression of penitence.—At Brookhaven, Miss., three white men are in jail for murdering a negro named List, and Governor Vardaman has sent militia to prevent a release of them by their friends. A detective employed by him joined a Whitecap band and obtained evidence relating not only to this murder, but also to plans for the killing of other negroes.—At Camilla, Ga., last week, one Williford, a negro, was convicted of murder and sentenced to be hanged on October 6th. He was guarded by militia, who were ordered publicly to load their rifles and to use them if there should be any attempt to lynch the prisoner.—It is announced that Senator McLaurin, who has been employed to defend W. C. Eastland, who is soon to be tried for assisting in burning at the stake Luther Hollsert and his wife for the murder of a white man, some months ago, will endeavor to convince the jury that this burning was justifiable. Governor Vardaman sent troops on a special train to prevent this lynching, and it is said that prominent attorneys have been retained to oppose the Senator.—All the negro inhabitants of Carlisle, Ind., twenty families, have been driven out of the town by a mob, because a constable was wounded by a negro farmer, who had quarreled with men of his own race and was resisting arrest. The white residents says that they will have no negroes in Carlisle.—In a letter concerning the burning of negroes at Statesborough, Ga., Senator Tillman says:

"Mobs are bad, but they are evidence of the spirit of liberty. We of the South have thrown off the yoke of the black majority. From necessity we used force and fraud. The negroes have the memory of eight years of license, and, inspired by the actions and utterances of President Roosevelt, they have given evidence only too plentiful of a hope and belief that their time will come again. Race antagonism and hatred grow apace. Negro equality is something that will not be tolerated, and if it comes to war the negroes will be exterminated."

Labor Disputes

No settlement of the controversy between the builders and their workmen, in New York, has been reached. The striking and locked-out unions have sought the assistance of other organizations, and there is talk of a general strike if the employers do not yield this week. It is said by the employers, however, that they will neither enter into an agreement with the locked-out unions nor discharge any of the non-union men now at work.—A report that the cotton mills at Fall River would be opened on October 3d for all who were willing to accept the wage reduction, caused the weavers on strike to hold a meeting and to declare by unanimous vote that they would not enter the mills. But it appears that the report was not well founded. The strike is now in its ninth week, and many of the strikers are living on charity.—The coal miners in Tennessee have been advised by the union's Executive Board to accept a reduction of 7 per cent., because a strike

could not be successful.—Seven thousand men are idle at Pullman, where the car works have been closed. The workmen were directed to remove their tools, and this leads them to think that work will not soon be resumed.—Orders have been given for work at full time (55 hours per week) in the shops of the Pennsylvania Railroad Company, where only 32 hours have recently been the rule for a majority. This change affects 20,000 men.—All of the members of the Amalgamated Association employed in the Mahoning Valley have been ordered out of the mills by President Shaffer. This order is aimed at the Carnegie Steel Company, and it follows a strike in the steel hoop factories at Youngstown and Girard, O., where the manager is now willing to sign the wage scale and to employ union men only. But he insists upon retaining the new men recently employed, and the union demands that all the strikers shall be taken back. It is not expected that the strike will involve other branches of the Steel Corporation.

The Philippine Islands

General Wade reports to the War Department that it is not only practicable, but also advisable, to reduce the military force now maintained in the islands by withdrawing one of the four regiments of cavalry and two of the nine regiments of infantry. It is expected, therefore, that the soldiers who are not needed will soon sail for San Francisco. Brigadier-General Carter, commanding the Department of the Visayas, in his recent annual report, urged the importance of holding Manila and the other principal seaport cities by an armed force, to insure control of the islands. Sites for permanent garrisons, he said, should be selected. "Temporary construction and makeshifts of every kind only serve to develop and confirm in the minds of the Filipinos the idea that the Americans do not intend to hold the islands permanently." He also remarked that the "effect of native drinks on Americans" was "violent and deleterious in the extreme;" and spoke as follows of the exclusion of the canteen or post exchange:

"The construction of some of the posts has been followed by the usual crop of saloons and disreputable people. With the well-regulated post exchange of former days the weak had a choice of evils and generally chose the less—the pure beer of the exchange. So long as the misguided Christian women of America insist on carrying the canteen question into politics, young soldiers whose powers of resistance to temptation are below the normal, or not firmly exercised, will continue to fall victims of the plagues of service in India and the Orient generally—drunkenness, dissolute company and venereal diseases."

Having been commissioned by the War Department to report concerning the reconstruction of certain parts of Manila and the planning of a summer capital in the highlands of the Province of Benguet, Daniel W. Burnham, the well-known architect, of Chicago, will soon sail for the islands.—There has been published an interview with Dominic I. Murphy, who was Pension Commissioner under President Cleveland and is now secretary of the Isthmian Canal Commission. Mr. Murphy is a Catholic and was recently the editor of a Catholic journal. He says:

"Independence for the Philippines, at least for a long time to come, would be calamitous, especially to the Catholic Church in the islands. The Aglipay schism is nothing more or less than a continuation of the Aguinaldo rebellion, and we all know how hostile that movement was to the Catholic Church. I believe that if independence were granted to the Filipinos, and our forces were withdrawn from the islands, the last ship would hardly have sailed out of Manila Bay before our bishops and priests would be in imminent danger of their lives, and our churches and church institutions would be burned to the ground."

Mr. Murphy's statements were made in reply to questions suggested by recent declarations of Catholic journals in support of Mr. Roosevelt and by predictions that other journals of the same class would take this course.

Russians at San Francisco

As reported in our last issue, the Russian converted cruiser "Lena" made its sudden appearance in San Francisco harbor on Sunday, September 11th. Our Government had previously been able to escape any complications with the Eastern war, except as consignments of American goods in foreign vessels had been captured by the Rus-

sians. Now the same difficulty was presented as the Germans and French had met when Russian war vessels escaped from Port Arthur had sought refuge in their Eastern harbors. Under international law the "Lena" had the right to remain but twenty-four hours, and to take on only coal and provisions enough to allow her to reach the nearest Russian port, which was Vladivostok. But her captain claimed that her engines were in so bad a condition that it would not be safe for her to go to sea without considerable repairs that would take some weeks. Immediately American war vessels in San Francisco harbor were directed to guard the "Lena," and the most careful investigation of the condition of her boilers was made by experts under direction from Washington. They found that the repairs were necessary, altho in two weeks partial repairs might be made, such as would allow the vessel to make eight miles an hour. She is, however, capable of making twenty miles, being one of the auxiliary cruisers built for mercantile and passenger service, under subvention of the Government for use in time of war. It seems that with two or three other similar cruisers she had left Vladivostok and had sailed across the Pacific Ocean by a northern route, probably with the hope of intercepting Japanese vessels carrying large freight from this country. Where the other vessels are is not known at this writing, but it is supposed that they are hovering near our coast, where one has been seen. The condition of the "Lena" made it necessary that she should remain longer than the twenty-four hours, and finally, by request of the captain, and after correspondence with the Russian Government, the authorities at Washington consented that she should be dismantled and remain interned, with her officers and crew, until the close of the war. This was done with full consent of both the Russian and the Japanese Governments, altho the latter insisted that the officers and crew should not be sent back to Russia, but should be kept in San Francisco, where they are to remain on their vessel, but on parole within the limits of the city. Thus the Japanese escape any further danger from the cruiser, while the Russians save their vessel at the end of the war. Meanwhile we escape any unpleasant complications and keep the good will of both combatants. American vessels have been ordered to make search for any of the other Russian cruisers, apparently with the view of protecting our merchantmen from attack.

A Lull in the War

During the week no active operations have taken place with the armies about Mukden. Both sides were so utterly exhausted by the week-long battle of Liao-yang and impeded by the mud that it was physically impossible to do more than to bury the dead and care for the wounded. It is probable that not less than fifty thousand were disabled in the battle. It also became necessary for both sides to bring reinforcements. The report that the Russians had received heavy reinforcements from Vladivostok does not seem to be confirmed, but a large force has gone south from Harbin. At the same time the Japanese are using water communication, by Niuchwang and the Liao River, to add to their strength. The Japanese hold Liao-yang, but have not occupied it, for sanitary reasons, on account of the number of the dead bodies. Their armies have slowly followed the Russians in their retreat along the railroad to Mukden. The Russians are mainly about Mukden, altho a considerable part of their force has passed on nearly forty miles to the Tieling Pass, where is a narrow defile by the river, and where they are likely to make a strong stand, if not at Mukden itself. The Japanese, who seem to be able to bring on reinforcements quite as fast as the Russians, have their main force along the spur of the railroad which goes to the Yentai coal mines, but they extend north, under General Kuroki, along the east flank of the railroad very nearly as far as Mukden; but at a distance of some miles, and another force is moving in the west to Sinmintun. Once more it is believed that it is the aim of Oyama to outflank the Russians and cut off their retreat by seizing the railroad to Harbin, in accordance with his previous plan, which failed in the battle of Liao-yang. Skirmishing has already begun a dozen or twenty miles southeast of Mukden,

and it may mean a great battle. In anticipation of such a battle there the Chinese Government has made representation to both sides for the protection of the sacred imperial tombs, which are but a few miles from Mukden on a high bluff that would be likely to be a scene of battle, in which case the tombs would be likely to be demolished by the cannonading. Both sides have promised to respect the tombs. The Russians, however, seem to be retiring toward Harbin, where it is reported that General Kuropatkin has made his headquarters, and only two Russian divisions are said to be south of the Hun River just below Mukden. The Russian losses in stores and ammunition at Liao-yang were enormous, as it was the richest entrepot in all Manchuria, and eighteen immense depots of supplies were destroyed. A dispatch from St. Petersburg to a French paper puts the value of material lost at Liao-yang, including fortifications, at $30,000,000, with the loss of two generals, 256 officers, 21,800 men and 133 guns.

The Defense of Port Arthur

The Japanese seem to be renewing their bombardment of Port Arthur and a general assault appears to be imminent. The Japanese are said to be mining to reach the forts, and a capture of 500 Russian cavalry is reported. It is clear that the Russian ammunition is giving out and that provisions are not abundant. The Japanese have again sent a demand for surrender, but it is said that General Stoessel replied that if such another demand were sent he would hang the envoys. The latest news from within the fortress comes from Lieutenant Prince Radziwill, who has escaped in a junk to Chifuh, bearing dispatches to General Kuropatkin. He declares that the belligerents on both sides have reached an absolutely merciless stage, and that each side accuses the other of violating flags of truce and Red Cross flags, so that they fire upon them. Prince Radziwill served with the British in the Boer War, and was in the siege of Ladysmith, but says that the conditions in Port Arthur are much more terrible. The Russians believe that in case of surrender they would be murdered by the Japanese. General Stoessel allows civilians to leave Port Arthur, but there are three hundred women there who refuse to leave the cure of the wounded. Mme. Stoessel is at the head of the nurses and indefatigable. Many Japanese dead on the slopes of the hills are yet unburied, since flags of truce are ignored, and the stench is intolerable. He tells of two companies of Japanese whose retreat was cut off and who hoisted a white flag of surrender, which the Russians would not regard, but continued to fire volleys into them. Meanwhile, the Japanese in the rear, angry that their companions should have hoisted the white flag, also fired at them till all were killed. The Prince says it is reported that General Nogi has been killed, there have been other reports that his successor has been appointed, but the Japanese deny these rumors. The Japanese are taking more pains to capture blockade runners, but junks do bring in large quantities of rice and flour.

Feeling in Russia

General Kuropatkin has received for himself and his army a sympathetic address from the Czar praising their courage and their skilful retreat. Yet the defeat at Liao-yang has greatly disappointed and considerably disheartened the people at home. There seems to be a new outbreak of the difference between the Grand Ducal clique that have controlled the Government and directed the war and the more liberal leaders, of whom Prince Mestchersky, a Russian editor with access to the Czar, has published a letter in which he rebukes those who declare that the war must be fought to a finish. He desires an understanding with Japan, and an alliance for control of the East. He speaks of the Czar's desire for peace, and then of the utter exhaustion that will follow if the war is continued, which will help neither side, but be of advantage only to their rivals. Russia will be utterly weakened for many years, while England and Germany will gain all the prizes. But the war party is fiercely opposed to any understanding, and will carry the war to a finish. There is much talk of the supposed agreement between Russia and Germany in protection of the

latter's interests, but Germany denies what seems to be generally supposed to be the fact. That Germany and Russia should now make an alliance with Japan is utterly unlikely, for Japan seems to be also bent on securing a complete victory, and will look rather to England and China for her allies. It is generally remarked that if it be true, as suspected, that Germany is trying to patch up a peace which would make Russia and Japan partners in the East, she is not likely to succeed, inasmuch as Japan has no good will toward Germany. We hear constant reports of indifference, if not hostility, in the Russian provinces. The order for the mobilization of the reserves makes trouble. Eight thousand reservists are missing in Kherson, 3,000 in Ekaterinoslav and as many in Bessarabia. Seventeen officers have been arrested in the Kieff district for disaffection, and peasants and artisans are refusing the summons to mobilize. The Russian ukase making concessions to Jews as to their residence and trading is regarded by many as a device to secure favor of Jewish bankers on the Continent to the attempt to raise a large loan. Those Jews who are to be allowed to settle or rent premises outside of the towns are mechanics and guild working artisans, discharged soldiers and those who have received the higher education. But these are just the ones who will wish to live in the towns, while the poor Jews who have been driven from the hamlets of the pale into the towns are not relieved.—Prince Peter Sviatopolk-Mirsky has been appointed Minister of the Interior to succeed the murdered De Plehve. This is regarded as an excellent appointment under the circumstances, for he is said not to have the harsh and tyrannical disposition of his predecessor. He is forty-seven years old, of noble family, tracing his descent from Rurik, the founder of the Russian monarchy. He graduated from the Imperial Page Corps in 1875, was made captain three years later and appointed aide de camp to the Czar as a reward for his gallantry during the Russo-Turkish war. After rising to the rank of major-general in the army he was appointed Governor of Penza, and two years later he was transferred to Ekaterinoslav. In 1900 he became Assistant Minister of the Interior under Sipiaguine, who was assassinated April 16, 1902. The late Minister of the Interior, De Plehve, appointed him to his present post of Governor-General of Vilna in exchange with Von Wahl, who had narrowly escaped assassination.—The detailed and interesting story of the escape from prison of Sassoneff, the murderer of De Plehve, by means of forged letters and pretended policemen, which was published in London, is officially denied at St. Petersburg.

The Tibetan Treaty

The substance of the treaty with Tibet concluded by Colonel Younghusband is given in the London *Times*. The Tibetans are to open three marts for mutual trading with India; they are to demolish the forts which have blocked the way; to give an indemnity, said to be $2,400,000, in instalments within three years, during which time British troops will occupy the Chumbi Pass; and they also agree not to sell, lease or mortgage any Tibetan territory without British consent, nor to allow any other Power to be concerned in the administration of the Government. The Dalai Lama, who fled on the approach of the British, is supplanted by another favorable to their purposes, by proclamations of the Chinese Viceroy. The cost to India of the expedition into Tibet is said to be about $4,000,000. The European papers express the opinion that the British have simply made Tibet a feudatory state, and that, while they have opened the door into Tibet from the south they have shut it to the north. They have secured themselves against any Chinese invasion, or the extension of Russian influence coming from the west or north. In the minds of hundreds of millions of Buddhists British importance is greatly increased because Great Britain holds the destinies of the country of the Chief Lama. The British will leave Lhasa September 23d, which is about as late as is safe. Already there are hard frosts nightly, and snow in the passes. From this time Tibet can no longer be called a Hermit Nation. It will be open to travel.

The Head, The Hand, The Heart

BY ANNETTE KOHN

THREE Nations stood before mankind
And prayed: "For us true judgment find;
Say which is worthiest of renown,
To hold the palm and wear the crown."
Three Nations that held mighty sway
And wrought great deeds in ancient day—
Proud Greece her conquering flags unfurled,
And mighty Rome that ruled the world;
Then meek Judea following came—
Three rivals—each with rival claim.

First Greece came forward and did plead
The crown should grace her sovereign head;
Her eyes saw beauty everywhere,
And Art for her did witness bear—
Behold in Nature's wonder book,
From hill and forest, running brook,
Her *brain* did hidden meaning seek,
And from her lips did wisdom speak,
She gave the world immortal song—
To her—to her, the palms belong.

Then Rome raised up her mailèd *hand*,
Said, "I did conquer sea and land,
Where'er my armies did encamp
They left of me the signal stamp;
I builded bridges, roads and towns,
I gave the Church its triple crowns.
'Twas I taught chivalry to flower,
And sowed the seed of feudal power;
In every conflict I struck home—
Who dares defy Almighty Rome!"

Then meek Judea in her place
Did upward lift her starry face:
"I make," she said, "no warrior claim
To win the shining crown of fame;
But since the day I quaked in fear,
When Sinai's God my soul did hear,
I taught men, tho I swooned in wo,
The Law, and Truth, and Love to know—
'Tis through the *heart* my claim I make,
I ask the prize for your souls' sake."

The Judgment Bar was satisfied;
Each cause was well and truly tried—
It said: "At last, O Judah, thou
May'st lift to Heaven thine anguished brow.
We read all clearly in thine eyes
The Truth that long we did despise.
The Head and Hand have ruled their day.
Their scepter now has passed away—
We yield the palm, the crown to thee—
The *Heart* rules to Eternity!

New York City.

The New World's Highway

BY W. W. RUSSELL

United States Minister to Colombia

[Mr. Russell was formerly assistant to Minister Bowen in Carácas, Venezuela From February 1st to June 1st of the present year he has been Chargé d'Affaires in the new State of Panama, and his experience makes this article, obtained as an interview, reliable and authoritative.]

IN company with the new Panama Minister to the United States, Señor José Doming de Obalï, I have just come up from Panama on leave of absence and left everything there pleasant and hopeful. Colombia has ceased to threaten the new state, and it is not likely that she will take any action in the direction of coercion. For better or for worse Panama in the future is likely to go her own way. She is only a few months old, but so far her proceedings have evinced a degree of sanity, not to say common sense, highly flattering to the present Government.

Of the $10,000,000 recently paid by the United States to Panama she has used a portion in paying off debts, has another portion still in hand, and has sent Commissioners Arias and Morales to this country with $6,000,000 to be invested "for the good of posterity"—meaning the posterity of Panama. These Commissioners are now in this country and will represent Panama at the World's Fair.

There was some fear that the large payment from the United States might precipitate an era of extravagance and do actual harm, but I have been on the spot ever since last February and saw no signs of such a result. The Government and the people are behaving very soberly and are making preparations for the great changes which the canal will cause throughout the world, but more especially throughout Central and South America. Of course, the first of these preparations was a general raising of rents, which has caused some grumbling.

There is a general interest in the canal, a belief that the United States will bring it to successful operation and that the benefits flowing from the traffic which will pass through will be felt in largest measure by all the Americas. I think that the people in the neighborhood of the canal's zone are quite as much alive to the benefits it will bring as are the manufacturers of New York, who will thereby find new markets opened at their doors.

The South Americans and Central Americans would sooner do business with the people of the United States than with Europe, but they have hitherto found the "Yankees," as they call them, indifferent to South American demands and requirements, and somewhat ignorant and careless concerning the conditions of the trade.

A wholesaler writing from some South American city to the manufacturer in New York gives special direction concerning the packing of goods in manner to suit his particular requirement, but to such directions the New York manufacturer is likely to pay no attention, shipping the goods in whatever way best suits him.

On the other hand, the German manufacturer complies with greatest care and minuteness with all the directions received from his customer, and, as a necessary result of this wise policy, the German trade with South America has been increasing fast, while ours stands still. This is certainly not as it should be, as the South American market is most valuable now, and going to be much more valuable in the future. As I have said, the South and Central American people would sooner deal with the "Yankees," if the latter did not make such dealings so very inconvenient by ignoring the fact that the whole Southern continent is practically without railroads or any other means of transit, save by mule-back or llama-back, and that, therefore, goods to be carried inland must necesssarily be put up in mule-loads, according to the directions of the South American wholesaler.

Of course, there is some prejudice

against "Yankees" among these Latin-American states, and one sometimes hears the North Americans abused, but this goes along with a very strong admiration for our country, and when it comes to a question between ourselves and any European Power the South American or the Central American ranges himself with us quite as a matter of course, and boasts of the fact that in the very forefront of nations stands the United States of North America.

The Protestant missionaries at and in the neighborhood of the Isthmus are doing a great and noble work in educating the people and ministering to the sick, and this work is thoroughly appreciated, yet at the same time there is a general latent suspicion. The whole population is Roman Catholic. It has always been Catholic since the days of the first Spanish settlements (at least as far as the white men are concerned); it can see no reason for changing. Yet there is a fear that the Protestant missionaries' vigorous operations may not be unconnected with a desire to turn Romanists to Protestantism. Religious freedom prevails throughout Central and South America. There is no attempt to persecute Protestants. They simply don't exist except among foreigners.

When I came North all was tranquil among the Southern Republics. Venezuela has had peace for nearly a month and others have made even better records. I think that as time goes on the revolutionary tendencies in these South American states will subside and the Governments will gradually become businesslike and stable. I believe that any one who has watched the Southern continent for the past fifty years must agree that a large part of former effervescence is now missing, and certainly the examples of Mexico and Chile prove to us that the Latin-Americans are far from being incapable of conducting Governments on democratic principles. Undoubtedly we will soon see other states giving good examples of stability.

South and Central America are securely wedded to republican government. I feel assured that Dom Pedro, formerly of Brazil, was the last of American monarchs. There is no monarchical party in any state, and the revolutions are simply caused by the Outs, who want to get in office and have not yet learned to manage things smoothly as we do here. As the poet remarks concerning another case:

> "Their manners have not that repose
> Which marks the caste of Vere de Vere."

In the absence of revolutions the only topic of general interest besides the canal was the rumor about treasure on the island of Cocos and the movement of warships consequent thereupon.

Tradition says that a great treasure was buried by somebody somewhere in the island of Cocos during the buccaneering times. German and English men of war have recently gone there to see about the matter, and I note that the U. S. S. "Tacoma" is also on the spot. Much expectation has been excited, but it has often been so before when the only result of search was the discovery of a mare's nest.

I went to Panama from Carácas with a good deal of trepidation, but I found that the evil conditions had been considerably exaggerated. There is, of course, an awful climate, but not quite so bad as people represent it. It certainly is not the cemetery that I imagined. Soon after I arrived the tertian fever presented me with the freedom of the country and entertained me quite hospitably for a week. I had to take to bed. One day my temperature would be extremely high and the two following days it would be normal, while I was very weak. The third day the high temperature would be renewed.

At the end of a week I was up and about again, none the worse for the tertian fever, and I have not had it since. I don't know what Chagres fever is like. Certainly the climate cannot be as bad as has been represented, when we find that Europeans and Americans can live there thirty or forty years and retain good health. A case in point was that of Mr. Henry Ehrman, the banker, who resided in Panama for forty years.

Nor do these countries in their capitals lack the attractions of excellent shops and of good society—in fact, a very high and fine society into which few Americans can penetrate. This is composed of the Spanish aristocracy, who have as

good opinion of the bustling, pushing, assertive and often vulgar white man from North America.

The city of Bogota is 8,000 feet above sea level, and yet the appurtenances of civilization are all to be found there. Most of these have been transported over the mountains, and their appearance at such a hight is very surprising to the stranger. There is certainly no lack of pianos, and one feels greatly tempted to inquire how in the world they could ever have been brought up the trail. It is said by those who know that in Bogota is spoken the very purest Spanish in all America. Old-fashioned Hidalgoes are there with their families—men with tremendous pedigrees, living in the glorious past. It is not easy for moderns to gain the *entrée* among them.

In return for the $10,000,000 paid to Panama the United States has obtained the lesseeship of a strip of territory ten miles wide, traversing the isthmus from side to side, with the canal line in the center of it. This divides the State of Panama, so that the people of one part desiring to visit the other will be obliged to cross territory which is in charge of our Government. But that fact is not expected to cause inconvenience.

Nobody yet knows when the canal will be finished. Perhaps not for eight or ten years. It is even not yet decided whether it shall be a lock or tidewater canal. If tidewater, some of the cuts will necessarily be very deep and the engineering problems most difficult. The vagaries of the tide also will make trouble, for tho on the Atlantic side of the canal line it rises only eighteen inches, on the Pacific side there is a rise of 21 feet.

However, the commercial world can well afford to wait a little longer in order that the best possible canal may be constructed. There is already great traffic of freight across the isthmus by means of the railroad there, but this will appear trivial in view of the tremendous trade tide that will surge across the new world highway after its completion.

NEW YORK CITY.

My Experience As a Political Orator

NEARLY every newly fledged member of the Bar is filled with a consuming desire to go on the stump and tell the American citizen just how he should cast his vote. I was no exception to the rule. Four years ago, when I first gratified my desire for stump speaking, it seemed to me that every ambitious young lawyer in our State—and some men who are ambitious but who are not lawyers—wanted to make political speeches. It was a Presidential campaign, however, and it furnished a golden opportunity for many thousands of just such men.

Not being acquainted with the mode of procedure in such cases, I wrote to the chairman of the National Republican Committee, and offered him my services during the contest. He replied to me very kindly; but referred me to the chairman of the State Committee. I afterward discovered that only the big guns, such as the Lodges, the Shaws, the Spooners, the Charles Emory Smiths, the Gormans, the Hills and the Baileys, come directly under the supervision of the National Campaign committees. All of the other orators, and especially those of lesser note, are handled by the respective State committees. I called on the chairman of our State Committee, and presented to him the letter from the National Chairman as a method of introduction. He, in turn, referred me to the Chairman of the Committee on Public Meetings; and I began to wonder whether I was to be referred through the entire campaign before having an opportunity of making my speech. The subchairman looked me over very critically, pretty much as the stage-manager of a theater would scrutinize an applicant for the chorus. I seemed to satisfy him, for he took down a big book and entered my name and address.

Then he reached for another book, marked "Open Dates," and, turning to me, said: "We have five or six assignments still uncovered. If you desire to fill them we will be glad to have you do so."

"That is my wish," I replied. Then, more for information than from a desire for the money, I said: "How much am I to be paid for this service?"

He loooked up in surprise.

"Do you expect to be paid?" he asked.

"Why, yes," I replied. "Isn't that the custom?"

He shook his head very vigorously, and exclaimed: "Not here, anyhow."

"What do you mean by that?" I asked, noting the emphasis that he laid on the word "here."

"Well," he replied, "you have to get a national reputation before you can expect to be paid for making political speeches. Indeed, very few speeches are paid for. Senators, members of the House of Representatives and other influential men go on the stump and make their services a contribution to the cause. Of course, their expenses are paid."

"Well," I replied, with a little hesitation. "Don't you think I should be compensated to the extent of receiving my expenses?"

He deliberated for a while, and then said: "We'll get you your transportation. You will not have to pay your railroad fare."

"Is that all?" I asked.

He pondered again, and finally replied: "You look as if you could make a good speech, and I think I will be justified in putting you in the first class."

"What is the first class?" I inquired.

"That means," he replied, "that your expenses will be paid. In other words, we furnish you with transportation and take care of your hotel bill. You can consider yourself fortunate in getting into the first class so early in the game."

By his orders, I called at the headquarters a week later and received my first lesson in the art of campaigning. I was told to go up into the third story back room. On doing so, I found myself in company with sixty or seventy other young men—mostly lawyers—who were about to go on the stump for the State Committee. Presently an elderly looking man, with a shrewd, smooth face, arose, and said that he proposed to give us a little information regarding the proper method of campaign speaking. The first step, he said, would be to provide ourselves with copies of the campaign text-book. While he was talking, copies of the publication were passed around to the company. It was a closely printed, paper covered volume of between four hundred and five hundred pages. It contained the platforms of the two great political parties, the speeches of acceptance of Major McKinley and Mr. Roosevelt, and the speech made in the National Republican Convention of 1900 by Senator Lodge, who was the temporary chairman of that gathering. Then the "professor," as we facetiously dubbed him, told us that we were to pay particular attention to the speech of Senator Lodge. One man in the rear of the room called out:

"Why?"

"Because," was the quick reply, "it furnishes the keynote of the campaign. Before Election Day thousands of orators will take that speech as their text, and the principles enunciated in it will be preached to the people in every part of the United States from Maine to California."

After laying still more stress on the importance of memorizing the chief features of the campaign book, the speaker concluded:

"Above all things, stick to your text; stick to the substance of the matter contained in this book. Talk about the platform of the party and the history of the party, and study the speeches of the recognized leaders of the party. Tell all the stories that you can think of, and that would be appropriate at a mass meeting; but don't attempt to be bright at the expense of facts. Don't talk about any issues that are not involved in this campaign. We want to be very careful and not develop any Burchards."

Ten days later I was assigned to make a speech in a small town in the interior of the State. The meeting was to be held on Saturday night, because that afforded the best opportunity for the working people of the town and for the farmers in the outskirts to be present. On the train, going to the meeting, I had the pleasure

of the company of Colonel Smithers, a seasoned campaigner, who had been on the stump for twenty-five or thirty years. He seemed very much interested in me, and expressed a desire to assist me in making what he called my "debut."

"My young friend," he exclaimed, giving me a pat on the back that was by no means gentle, "you want to win the affection of your audience; then you can say anything. Get them in a good humor. Tell them stories, and when they show signs of becoming weary, quit—and quit at once; but, above all things, my boy, you must not be afraid of springing little jokes on them. Don't say that you have no jokes in your speech. That would never, never do. If necessary, buy a copy of Joe Miller's joke book, and if you can't get that go to the nearest drug store and borrow an almanac; but, above all things, don't be afraid to tell them stories. There's one thing you want to learn, and that is not to be afraid of a joke because it is old—the fact that it has lived so long proves that it must be good. Look at the minstrel shows; the jokes you hear there are the jokes your father heard before you, and those, in turn, are the jokes that his father heard in his day and generation. But they always go, they are always good for a laugh; and when you get the people in a laughing mood they are ready to believe almost anything you tell them."

The meeting that night might properly be denominated as a howling success. The little hall was jammed to the doors, and many were unable to obtain admission. A band of music that had paraded about the town for a couple of hours before the gathering in the hall, occupied the front seats, and between the speeches they blew forth such air splitting and heart rending tunes as "There'll Be a Hot Time in the Old Town To-Night," and, when the speakers were introduced, "See the Conquering Hero Comes."

My military friend was the first speaker; he caught the fancy of the audience from the outset. I followed him, and naturally felt a little timid at first; but as I proceeded I felt more at ease, and finally decided that it was about time to spring a joke on the people. It so happened that a majority of those in the hall were either of Irish birth or Irish parentage, and nearly all of the preceding speakers had gone out of their way to pay a compliment to the race. Stroking my broad, smooth face, I said: "I am delighted to see so many representatives of the Green Isle in this audience to-night; and it gives me pleasure to say that a strain of Irish blood runs through my veins."

At this point in my remarks a little round-headed Irishman who sat in a corner of the hall near the stage looked up at me in a quizzical way, and said in a confidential tone that was distinctly heard through the hall: "Well, ye may have Irish blood in your veins, but you've got Dutch ancestry in your face."

This was received with a roar of laughter; it completely demoralized me, and I was unable to proceed with my speech, and finally sat down in great confusion. Thus, my first effort as a campaign speaker proved to be a fizzle.

The following week there was another meeting in the extreme part of the State, and the Colonel was again my companion. He said to me as we alighted from the train: "Now, youngster, you want to keep your nerve. That's all that is necessary in this business. It's just like going on the stage. You have the ability, and all that you need is confidence in yourself. Have your stories so arranged that you can tell them without interfering with the regular order of your speech. Watch me, and you may get some pointers. You have often heard the story of the sign in the Western dance hall, which reads: 'Don't shoot the pianist; he's doing the best he can.' Well, I am going to use that story to-night, but in a slightly different form. It will be freshened up, and I think it ought to make a hit."

The Colonel was right. He went on and talked in his usual vein for about fifteen minutes, and then started in on a defense of a prominent Republican official at Washington who had failed in a certain line of duty. The Colonel claimed that the man had done everything that lay in his power, and for that reason should be given credit instead of blame. He added: "This incident reminds me very vividly of an epitaph which I once read on a board over a miner's grave in the Rocky Mountains. It read:

"'He done his damndest. Angels couldn't do no more.'"

Then he proceeded with his speech,

and was voted a success by the audience, which was largely made up of coal miners and other representatives of the laboring classes.

Thus inspired, I determined to try my hand at story telling. After criticising the opponents of the administration for their lack of faith, I said:

"These people remind me of the man who would not believe in the story of Jonah and the whale. There was a good old honest farmer in the part of the State I came from, who always took great consolation out of the fact that he believed in the Bible. One day he met a friend who was a skeptic, and his friend said to him:

"'Dan, do you believe in the Bible?'

"'Yes, certainly I do.'

"'Do you believe in all of the Bible?'

"'Why, yes, of course I do.'

"'Do you believe the story that tells how the whale swallowed Jonah?'

"'I do.'

"'Why?'

"'Well, because it's in the Bible.'

"'Well, do you know anything about comparative anatomy?'

"'No, I don't.'

"'Do you know anything about the construction of the human body?'

"'No, I can't say that I do.'

"'Well, then, I don't understand how you can credit this story. Why don't you investigate it? Why don't you try to find out something about it on your own account?'

"'Oh!' exclaimed Dan, brightening up. 'I intend to. I intend to find out all about it.'

"'Well, how?' asked the skeptic.

"'Why,' he said, 'when I go to heaven I am going to Jonah and ask him all about it, and, if he isn't there, you can ask him in the other place.'"

I had redeemed myself. The story caught on immensely, and the application seemed to be right, which is not always the case with stories that are told at political meetings.

After that I delivered other speeches in various towns throughout the State, and having "struck my gait," I went on very smoothly. Probably one of the causes of my success was the fact that I was naturally fluent. Some others who were not gifted in that way were not so successful. One lawyer friend always memorized his speeches, and sometimes practiced his gestures before a mirror. When he was permitted to go on with his speech from beginning to end it was delivered beautifully; but if he was interrupted—and interruptions from persons in a political gathering are very frequent—he would break down entirely, and at times was not able to finish his remarks.

But I might say that, after my first failure, interruptions did not affect me in the least. One night the meeting was held in a community which contained many persons who were friendly to Mr. Bryan and his theories on the silver question. While I was in the midst of my speech, some one in the hall cried out:

"How about the silver question? Why don't you tell us something about the silver question?"

"I will, my friend," I replied, quickly. "I witnessed an incident that illustrates the silver question only this afternoon. I was walking down one of your main streets with a prominent lawyer of this town when a shabbily dressed man with a dissipated face came over and tapped my friend on the shoulder. 'Pardon me for a moment,' he said.

"My friend shook him off, and said: 'I have no time to stop, I am in a hurry.'

"'Pardon me,' repeated the man, 'but I will only detain you for a moment; I would like to have a word or two with you on the silver question.'

"That was too much for my friend. He fished out a quarter and handed it to the advocate of free silver."

The audience took it good naturedly, and then I resumed.

"Your reference to the silver question reminds me of another little incident that happened in my experience. At a meeting held not many miles from here, Mr. Bryan made one of his most eloquent speeches. The great audience stood before him in open-mouthed wonder. When he had concluded, an old German woman went up and shook him by the hand. She held his hand so long and so affectionately that Mr. Bryan said:

"'You seem to be pleased with my remarks.'

"'Yes, indeed, I was, Mr. Bryan,' she said, 'and I come here to ask you one question.'

"The silver advocate felt flattered at this indication of his success, and said: 'Why certainly, I'll be glad to answer any questions you have to ask. What is it?'

"'Well, all I want to know, Mr. Bryan,' she said, 'is whether we will come after the silver, or whether you will send it home to us.'"

That story, also, seemed to hit the fancy of the audience; by the time I had finished they were in a thoroughly good humor.

The incidents are only fragments taken from my campaigning experience of more than four months. To go into them any more fully would be beyond the scope of this article, and might not prove interesting to the reader. I can say that my own experience proved to be a great object lesson, and gave me an insight into human nature such as I had never had before. I am told by men who have gone on national campaigning tours that they have returned better Americans than when they started on their trip. The effect of making speeches before different kinds of audiences night after night, and of coming in direct contact with all classes of people, is more educating than all of the books in all of the libraries to be built out of Andrew Carnegie's money can ever be.

Training Animals by Their Sixth Sense

[The writer of this article is a lady who has become noted among breeders of so-called "fancy stock" because of her remarkable success in raising prize winning horses and dogs. She has made this her profession, and is undoubtedly the only woman in this country to follow the method she describes, in preference to the use of the ordinary ways of training employed on the stock farm. She has had ample opportunity to study what many believe to be the sixth sense in animals, and makes use of it in educating them.—EDITOR.]

WHEN I was about six years old I became acquainted with Dick. Perhaps I fed him a few wisps of hay or a lump of sugar. Anyway we soon became chums, and when I went into his pasture Dick would come to me without a word and follow me about like a dog. Something told him I wanted him for a playmate, as I lived so far away from the children in the neighborhood that we could not often visit each other. Probably Dick felt lonely also, for at that time he was the only horse we had.

It never occurred to me that he could injure me. In short, such was my confidence in him that sometimes I would sit on the straw in his stall while he stood over me feeding, or if he were lying down, would huddle up closely to his warm body, right between his fore legs and hind legs. As if Dick would do his best friend any harm! At last the idea occurred to me of riding him. I had never been on a horse's back in my life. I had never even put a bridle on him. I did not like to ask anybody to help me, fearing father might learn of it and forbid me to be around the horse. I thought a while and finally hit upon a plan that was successful. Leading Dick under a tree, I climbed into it and slid down on his back from one of the branches. Then, touching him with a little switch I had broken off, we started, fortunately at a walk, for I had to cling to him as best I could; but the horse seemed to know that he was the first to carry me, and so we went over a part of the pasture, tho my first ride was without saddle or bridle. Now that I was on, how was I to get off? Well, to make a long story short, I managed to guide Dick under another tree, then, swinging myself onto a limb, climbed safely to the ground.

It was not long, you may be sure, before I had my second ride, then another and another, until I became so accustomed to the horse's motion that I did as they do in the circus—rode kneeling, then standing on his back. Sometimes I would lead Dick up to the side of a wall

and get on him from its top. In fact, I became quite expert in mounting, and next decided to put on his bridle. After a few trials I could do this easily, for Dick helped me by putting down his head so I could slip the bridle back of his ears. This was such a help in riding that I increased his speed, until we would go at a run around the lot. Finally some one saw me and told my parents, but when they had seen how I could handle the horse they allowed me to continue to ride.

I thus learned how a horse can show his affection and confidence; but I remember one incident that displayed his intelligence. One of my uncles chanced to visit us, and father spoke of my ability to ride horseback. He said he did not believe it could be possible. It happened that we were at breakfast at the time, and I heard him. I determined to convince my uncle, and, slipping away to the barn, put the halter on Dick, and, getting on his back from somewhere, started at full speed for the house. The family had just come out on the porch and I thought how I would surprise them, for I had thrown the halter reins on the horse's neck and holding on in this way was merely astride of his bare back. As we were crossing the lawn he shied at something and threw me for the first time. As I fell, I grasped the bridle, and was dragged along the ground directly under one of his fore feet. Dick could not put it down without stamping on me. He realized my danger and stopped of himself as soon as he could, but we were going so fast that he carried me nearly twenty feet—holding up the leg above me and going on the three others. When my father took me from under him, the horse actually kept his foot raised until I was safe, then put it down and began nipping grass as quietly as if nothing had occurred.

It was several years after this that I had my first dog. Father gave me permission to buy one provided it was large enough to keep away thieves, who were fond of visiting the orchard and garden and helping themselves. Royal was a St. Bernard, and when I saw her at the

Four Friends

A Family Group

bench show she attracted me, because she had such an expressive face. The man who owned her, of course, told me she was a fine dog, but at that time I knew little about what blood means to a dog, and when I bought her I kept the record of her pedigree more out of curiosity than anything else. She proved to be a model watch dog, but displayed so many other traits that I soon realized here was another animal not only fearless and obedient, but so intelligent that she appreciated what was done for her far more than some people appreciate acts of kindness.

If I were to tell all of the stories I know about the lives of Royal and Grandma, Aunt Sarah, Baby Bylo and Baby Beautiful—her descendants—they would fill a book. At different times we have had from fifteen to twenty men employed—some about the stables, others in the field, others on the grounds near the house. One day a field hand went into the barn on some excuse. Instead of doing his errand he sauntered into a stall, but he had been in it only a minute or so when something shaggy came in and placed itself between him and the horse. A growl warned him to leave, and he did without delay. Grandma, apparently asleep on the lawn, had seen him enter. She needed no command to watch him. Had he gone in, picked up a tool and left at once, she would probably not have stirred, for a dozen times a day the gardeners and other outside workmen went to the stables for shovels and various implements without being molested. If any of them entered the house and loitered in the kitchen to chat with the servants, they did not remain long. The dogs might not see them, but they very soon scented their presence and followed them. More than once a scratch at the kitchen door has informed Bridget and Patrick that Pat must leave and attend to the work he was neglecting.

Grandma has always slept in my room, either on the floor or across the foot of the bed. One of the men employed in the house was apparently honest and trustworthy. He did his work well and I never saw him idling away his time. It was not necessary for him to go on any of the upper floors, as he slept in another building. One night, after I had retired and had fallen asleep, I was aroused by a scratching noise. Grandma was trying to pull open the door with her paw. I naturally thought of burglars and quieted her while I listened, but

could not hear the slightest sound. As soon as I lay down she resumed her scratching. I opened the door and she noiselessly stole out. A minute later I heard a growl, then a cry and the sound of something falling on the upper floor. I hurried up to the garret just in time to prevent Grandma from killing our "trusty" man servant, who was prowling about in the attic for some purpose. He had taken off his shoes to muffle his footsteps, but the dog had heard him, and had him flat on the floor with her teeth in his coat collar.

If we come in from a walk or ride and the dogs are thirsty, there is never any growling over the water bucket. The one who comes first has the first drink, then the next takes her turn, the others waiting patiently. So it is with their meals. No bones are snatched away. If Aunt Sarah is served first, no one growls. A friend came to the house with a mongrel dog larger than either Royal or any of her family. He at once scented them and entered the barn, where they were at dinner. Aunt Sarah chanced to drop her bone. Grabbing it in his teeth, the visitor went over into a corner. Aunt Sarah looked at him, as much as to say "You certainly have poor manners," and quietly followed. He showed his teeth as a sign for her to keep away, but before he could defend himself she had him by the throat. The bone dropped from his mouth. Then she threw him on his back, and, taking her dinner, resumed it with the rest of the family. The visiting dog did not interrupt the meal again.

I might tell about how one of my friends went after a lot of our horses which had escaped from the field, and, herding them like a shepherd dog, drove them back—without my saying a word to her—tho she had never been trained for it; how two of them had the only quarrel that I ever saw between my dogs—a quarrel which so affected me that I actually began to cry, when they separated at once and one of them—Baby Bylo—ran to me, and, putting her paws about my neck, licked my face with her great tongue. Such were some of the reasons that made me think it worth while to care for horses and dogs; but I had another motive. As a child my health had been poor, but association with Dick and Royal and her children greatly improved it. I felt I owed them a debt of gratitude. I resolved to study them further, and if possible to raise types which by proper breeding would not only be strong, beautiful and intelligent, but docile and gentle in disposition. If one could develop all the better traits of a child by patience and kindness, why not a horse or dog? In our neighborhood was a stallion, which the owner said was vicious. The stallion was very handsome and almost perfectly formed. I bought him and began treating him by a new method. I went into his stall, stroked him and by degrees forced him to realize that I was his friend—not his enemy. Then I turned him over to one of my most careful drivers, who harnessed him and tried to get him to draw a light road wagon. The first day he was two hours in going a mile, balking and backing almost continually, but he was coaxed—not whipped. The second day he was much more tractable. In a year he was "broken" as I wanted him, and now he is one of the surest and best roadsters in my stable, altho a stallion. I secured another stallion, also very spirited—in fact, a magnificent animal. When I spoke about placing the two in adjacent stalls, horsemen told me it was dangerous. "It's bad enough," said one, "to have the two in the same building, for they will kill each other if they can get loose. A stallion is like a wild beast if he knows another is around." I did not take the advice and they became next door neighbors. I made King Alar my friend as I had made Darmon. I went in and out of their stalls as freely as if I were visiting Dick. True, at first they sniffed and pawed some, but kind treatment, plenty of exercise and proper feeding made of them friends instead of enemies—such friends that I have seen them stand head to head, one licking the other's face. I drive them about the country with as little difficulty as if they were so-called "ladies' horses."

I soon learned that my little colts needed attention and affection just the same as Royal's puppies—that I could do some things for them which it was impossible for their mothers to do. When they should have more nourishment than they could get naturally, many a one

have I fed with a spoon until instinct told it how to drink its milk from the pail. As soon as they are born, I see that they have plenty of warm covering. There are a score of duties one can perform to aid mother and baby, just as the human mother is aided, but the animal mothers are very different from some human mothers—not a bit jealous when I put my arms about their children and fondle them. In this way they become Beautiful's first litter. When "Beauty," as we call her for short, left them for a little exercise or to get something to eat, in stepped Grandma or Aunt Sarah to lick them all over and cuddle them up warmly under her long hair, glad to play nurse until mother returned. Had a stranger gone in the box when any of the dogs were there, I don't think his life would have been worth much, but I have never had a paw lifted against me,

Darmon

as playful and friendly as kittens, and that fear of people, which so often makes it difficult to harness a young horse, passes away. The colts are "broken in" at their birth. And what do their mothers think? Often I have had one put her nose over my shoulder, by this caress showing her approval. I have helped hundreds of little ones through the first days of babyhood, but never have I known the mother to act ugly toward me in any way. And it is the same with my dogs. St. Bernards are peculiar in their love for their puppies. Not only father and mother, but the whole family will look after the babies, protect them and fight for them with their lives if necessary. I remember well Baby tho I brought up the babies partly on the bottle.

They know how I feel toward them—not by what I have done, but by their sixth sense.

We speak of the wonderful accuracy of a dog's scent and of the marvelous vision of a bird. Is it so strange, then, that animals should have the ability to know by instinct who are their friends and who are their enemies? I believe not only dogs, but horses of high breeding, have this sense. Time and again I have seen them show it by actions which proved their possession of it. They are different from us, especially in the fact that they never disguise their true feeling. They display aversion or fondness

by their manner, and I am convinced that they detect one's true character by observing mannerisms which we fail to see. Because they have this sixth sense, I believe they can be trained, or rather educated, by developing it, instead of using force, and that this is the only right way to bring out what is best in them. The success I have attained is due to the fact that perhaps I have realized more than others the value of this sense so peculiar to animals.

Baby Beautiful When Eight Weeks Old

In the Third Watch of the Night

BY HOMER M. PRICE

THE old station baggage man put a scuttle of coal in the big Cannon-ball stove, went into the telegraph office and then returned to the baggage room.

"No. 4's losing time," he said; "won't get here under three hours late. Did you have any baggage to check?"

"Well, that's why I've been waiting here for the last thirty minutes," I said, with some little impatience.

"Excuse me," said he; "I knowed the train wuz late, and most people set 'round here in the baggage room on cold nights, and I s'posed you wuz doin' the same. Where to, please?"

"Knoxville," I said, cooling off some.

He adjusted his glasses and looked clear over them for the pigeon hole of the Knoxville checks, and, finally getting one, he placed it on my trunk, remarking:

"Been over to the mines, eh? Purty cold drivin', wa'nt it? Coldest night we've had this winter, 'cept one; that wuz the night Ben Spillman's mother come. Know about that, I s'pose?"

"No," said I, "I never heard of that; I'm a stranger here."

"Well, sit down thar by the stove an' I'll tell you 'bout it, if you care to hear. Shows you're a stranger in these parts not to know 'bout it. Jest think of it, a lookin' for his mother for thirty-five year 'fore she come!

"Wait till I light my pipe and put a trunk agin that door; that wind from the mountain is mighty searchin', I tell you, stranger, it's mighty lonesome 'round here to-night. Not another passenger to go, and none of the neighbors out visitin', and that train 'way late. But you want to hear 'bout Ben and his mother.

"Well, Ben wuz here when I took charge of the station in '67—one of them awkward, shy boys, always gettin' in the way, but not meanin' to. Nobody knowed what he come from, just found him here one day on the platform after the east-bound train come in, a peerin' into every woman's face that got off. He looked at all of 'em, and then turned away, sayin' jest these fore words: 'She said she'd come.' He wuz 'bout five or six

then, they said, and all kinds of questioning only brought out those four words, and his name—Ben Spillman. It was believed that his mother had brought him down from the mountains and had got on a westbound train, a tellin' him she'd be back on the next eastbound one. It wuz just at the breakin' up of the war and nobody thought anything of strangers bein' about, and not one of them ever remembered of seein' the mother. The child wuz kinder weak in his head, sorter daffy like. Whether he wuz always that way, or the shock of losin' his mother wuz the cause of it, nobody never knowed. But thar he wuz when I come, the saddest faced little chap I ever saw, with his expectations 'way up every time the train come in, and 'way down to bass when the train had gone and his mother hadn't come.

"Some of the old residenters here said there had been a big wreck up 'bout Lebanon at the time the young one showed up, and that thar wuz two or three dead ones, one bein' a woman, that nobody ever knowed who they wuz. They 'lowed maybe 'twuz his mother. Others said that some woman wanted to get rid of a crazy child, and give him the slip, but I never believed that, 'cause the kind o' mother that would want to give her child the slip could never have impressed him with such confidence in her. True, he wuzn't just right in his head, but my experience is that that's the kind that knows the most 'bout some things. They've got somethin' in 'em that tells who's who. Some say it's instinct, but whatever it is, the Lord Almighty put it thar; so I says, that boy's mother wuz intendin' to come back.

"Well, Squire Heartsill takes the boy to his house, and he makes himself useful 'bout the place, runnin' errands and sweepin' out the furniture store, but no matter what he wuz doin', when the evenin' train from the West gave the signal for the station here, he came as fast as he could; and then if the train wuz late, he would come down and wait for it; didn't matter whether he'd had any supper or not, he'd stay here till the train come. Many a time, when he wuz a kid, I'd tuck him in here behind the stove on a cold night, with my overcoat, while he waited for the train. I used to try to get him to tell me what he wuz lookin' for, but he would look so wild and scared like that I stopped. He'd mumble a whole lot that I couldn't understand, but always ended with, 'She said she'd come.' If he had dropped off to sleep when the train would whistle he'd be sure to wake up, and his eyes would sparkle and he would go runnin' out on the platford, a clappin' his hands—then purty soon, as the train pulled out, I'd see him goin' slowly down the path to the Squire's.

"You'd think he'd 'a gotten tired, wouldn't you? But he never did. As he grew up the Squire wanted to send him to school, but he wouldn't go. I always thought it wuz 'cause the school house wuz too fur from the depot, so he stayed on thar in the shop, and come to be a pretty fair workman. He never had had much talk for anybody, and after he got to be a man he had less. He would go for weeks without sayin' a word to a soul, and I believe he would have forgotten how to talk if he hadn't had them four words to say to hisself every evenin' when the train left. He never said 'em to anybody; just sad like, as he turned away, he'd say, 'She said she'd come.'

"He made purty good wages in the shop, and saved his money. When he wuz a kid we wuz real good friends, but as he got older he got more distant toward me. True, he'd nearly always come in the baggage room just 'fore the train come and roll the truck of trunks up to where the express car stopped, but he didn't talk none.

"So matters went on this way year after year.

"One summer night the train wuz late, and there wuz no passengers to get on, and nobody at the depot lookin' for anybody to come, 'cept Ben. He wuz a grown up man then, I'd say about thirty, and he come out and set down on a truck with me. It had been an awful hot day and some thunder heads had gathered up in the west. Ben set there and watched the lightnin' without sayin' a word. The train wuz 'way late, and by and by the clouds got to comin' closer, and I said, 'Ben, it's goin' to storm. Are you scared of storms?' He waited some time 'fore he answered, then he said:

'No, I ain't scared of anything, except that she won't come.' You couldn't get his mind off of it at all. I asked him why he didn't go and hunt her, for he'd saved his money and could travel everywhere and find her. He said he'd thought of that, but then she might come while he wuz gone, and then she'd feel just like he did, when she didn't find him here a lookin' for her. He thought he'd best stay here and wait for her, for she'd said she'd come. I didn't say no more and we sat thar watchin' the comin' storm. Most an hour passed without a word, and then Ben said suddenly, 'Don't the Scripture say 'bout 'em comin' in the third watch of the night?' It kind o' startled me, and I said, 'Yes, b'leve it does.' 'Well,' said he, 'I b'leve she'll come some time away in the night; might be to-night.'

"When the train come, 'way long in the mornin', the storm had burst, and the lightnin' and thunder wuz makin' things lively. I didn't have anything to put on the train and the only thing that wuz put off wuz a little bull calf, and when the train left I found myself thar a holdin' to a rope with the calf at the other end. Ben had been back to the coaches, but he see in the lightnin' flashes my perdicerment, and he come to help me. The calf wuz a rearin' and bawlin' terrible, but Ben says, 'I'll take him, he's fer the Squire. I heard him a sayin' as somebody wuz goin' to send him a calf by express,' so he goes up to the bawlin' critter and says somethin' to it and it gets quiet. He takes the rope from my hand and goes down toward the Squire's barn. I see 'em 'way down thar when the lightnin' played 'round, the calf a follerin' 'long like a dog; and, as he'd sprung the Scriptures on me, I says to myself, 'And a little child shall lead them.' 'Course I knew that bull calf wa'nt no lion, but I wa'nt sure that Ben wa'nt a child. Years don't make you a man; it's knowin' and doin' things that are wrong that makes you quit bein' a child.

"That same summer a young feller from Kentucky came a courtin' Squire Heartsill's daughter Bessie. Bessie wuz only a slip of a girl, born and growed up since Ben went to live with him. He'd carried her 'bout on his shoulders all over the hills when she wuz a kid, a gatherin' sweet Williams and wild pansies. She always did the talkin' and the orderin', but she wuz mighty fond of Ben. After she grew up she went away to school, and when she come back she wuz the loveliest, liveliest girl in these parts. While she wuz away Ben had done nothin' but work and come to meet trains; so when one day she got off the cars and, comin' straight into Ben's arms, kissed him, the poor fellow wuz awfully taken back. He looked at his great rough hands and homely figure and grew awkward. Somehow he avoided her after that, and when she did come close to him he'd turn red and amble off. My wife, she goes up to the Squire's a whole lot, and she see how things were goin', and she says to me, 'Tom, he's in love with Bessie,' but I didn't take no stock in that, and neither did Bessie. She treated him just like she always had when he give her a chance, and I don't believe she ever thought about it, until one night six years after, when Ben's mother came, and she found it out.

"But that summer, when the fine young feller come out from Kentucky, and got off the train and asked where Squire Heartsill lived, Ben wuz thar, of course, and said he could show him, and the two went down to the house together. I saw 'em a goin' and saw Bessie when she met 'em at the gate. I don't know what wuz said, but Ben come back up to the depot and stayed aroun' till I closed up for the night. He never said a word, but it seemed as if somethin' wuz troublin' him that he couldn't quite make out, sorter like your dog looks when you hurt him accidentally. He knows you didn't mean to do it, but it hurts him just the same.

"Well, Ben spent lots o' time with me for the next two weeks, until the young feller went home again. The young feller at first was inclined to make fun of Ben, but he found out mighty quick from Bessie that that wouldn't do at all; so he tried to be friendly with Ben, and other times when he come down they got right chummy—that is, as chummy as two folks can get when one of 'em won't talk. They went huntin' and fishin' together, and one day Bessie went with 'em over to the lake, and Ben wuz quite happy a settin' silent in the end of the boat a

pullin' of the oars while the young folks fished and talked. But they were mighty kind to Ben and never talked anything but what he could hear. The young feller tried his best to get Ben to let him row, but it wa'nt no use. Ben just clung to the oars and watched 'em, or, rather, watched her. That day he just got back in time to meet the train.

" 'Long next spring the weddin' come off, and I've always thought it was Providential that they married just in time to take the evenin' train; and, of course, Ben wuz at the train and didn't see the weddin'. He wuz dressed in his best, tho, and just as he wuz lookin' at every woman that got off the train, still expectin' his mother, Bessie comes up to him and puts her little hand on his shoulder and says, ' Ben, I'm goin' away, and I hate mighty bad to leave you. I'm awful sorry for you, and I wish so much that your mother would come. Ben, kiss me now, and God bless you.' The poor fellow kissed her, but when they wuz gone Ben watched the train puffin' round the curve yonder and says—he'd forgot to say it sooner—' She said she'd come,' and then burst out cryin' for the first and only time I ever heard of.

" He never seemed the same after that, tho he wuz, if anything, happier than ever before. But it was a kind of resigned happiness. He grew thinner and got tired easier. He didn't work regular, but would wander off to the hills where the sweet Williams grew, and would bring back great boquets of them to the train, thinkin', maybe, that one of the two women he'd seen leave might come back. The Squire's folks just let him do as he pleased, so year followed year, and Ben grew thinner and more holler eyed, but somehow his eyes got brighter and more intelligent like. 'Bout a year ago he quit work altogether, 'count of gettin' out of breath when he tried it. The doctor said it wuz his heart, and that he couldn't do anything for him, but that it wuz best for him to quit work.

" Well, Ben had a purty lonesome time, till long last fall, Bessie come back from Kentucky to spend a couple of months with her folks. It wuz worth a good deal to see Ben when she come, and he saw for the first time that other Bessie, her little three-year-old girl. Seemed as if Ben didn't know 'bout her, and he wuz trumped, I tell you, when he saw thar toddlin' on the platform a little chap, the very spirit of his old playmate of twenty years before. She went right straight to him, and he set her up on his shoulder without a word, like he used to do her mother. Thar's somethin' strange 'bout children and animals; they knows their friends quicker than us that reasons and suspicions. He carried her on down to the Squire's, and me and her mother follered on behind. This wuz the first time he ever failed to say 'bout his mother a promisin' to come. When he put the child down she puckered up her lips to be kissed, and she kind o' hugged him, but Ben never said a word.

" Them wuz happy days for Ben for the next two months. That child and him were together all the time; over the hills, through the brownin' woods and acrost the stubble fields they went. He made her all kinds of things, from punkin whistles to cornstalk fiddles; and he got so he talked to her. I expect he said more to her in them eight weeks than he ever said in his life before. We could see and hear him talkin' to her in a low, tender like way, but somehow we never asked the child what it wuz about. When winter come on she stayed most of the time in his room, and he never left her 'cept to come to the train.

" Well, the night the mother and child wuz to go back home wuz just such a night at this. A norther from the Cumberlands had been blowin' all day long, and as dark come on it turned a sleetin' just like 'tis to-night, and the train wuz late, same as 'tis now. Ben had come up to the depot on time, but when I told him the train wuz late he went back to the house. This wuz the only time in more'n thirty-five years he hadn't stayed here and waited for it, no matter how late it wuz. He knew they wuz goin' to leave and I guess he wanted to be with the child. Well, 'bout a quarter of an hour before the train come they all comes up from the Squire's, Ben a carryin' the child high on his shoulders. They stopped here in the baggage room, as thar wa'nt a good fire in the waiting room. Ben set right over thar in the corner, where he had curled up many a night, waitin' for his mother, a playin' with the child. His

eyes were bright like stars and his face terribly flushed, like he had fever. I talked with the Squire and the child's mother, and we had a sort o' silent understandin' not to notice the two over in the corner.

"Directly old No. 4 whistled, and we all made for the platform, Ben a leadin' with the child's hand in his'n. The engineer wuz a comin' to the station like somebody—no matter who—a beatin' tanbark. Ben's hat had blown off and he looked ghastly thar under the headlight, with his long white hair a flyin' in the wind. It had been white for twenty year or more."

The old baggage man stopped here and went into the telegraph office to see the last report about the belated train. When he came back he said, "She'll be here in ten minutes," and then went on with the story as if there had been no interruption.

"We never knowed just how it happened, whether the light blinded and scared the child or somethin' else took her fancy, but she slipped right away from Ben and run right out on the track. The engine wuz not a rod from her, and we all saw her a standin' a clappin' her hands. We wuz plum' paralyzed with fear; the engineer screamed for brakes and reversed, but it wuz too late, he couldn't stop. In the terrible confusion I saw Ben make a leap and fall sprawlin' on the track, but knockin' the child clar over on the other side. When the train stopped we ran 'round, and thar wuz the child safe and sound, but scared nearly to death. The pilot had thrown Ben clear of the wheels, but his side, the heart side, wuz just one big wound. We carried him here in the baggage room and sent for the doctor. He lay like one asleep, without pain, seemingly, with his eyes closed. The doctor examined him and shock his head, said the heart wuz givin' out. For two hours he lay that way, with his head in my lap and the mother, Bessie, a bendin' over him. Finally his eyes opened, and the old, crazy look wuz all gone. He saw her thar a hoverin' over him, and cryin', and we heard him say, very low, 'Kiss me, Bessie,' and Bessie just kissed him again and again, and told him how sorry she wuz. He looked very contented, and said, between his gasps for breath, 'Don't be sorry. I would have died any time in the last twenty years for you, or for—one—you—loved.' Then his eyes closed again, and we watched and waited a way long into the night.

"'Bout the third watch he stirred and tried to get up, sayin' excited like, 'The train's comin' with my mother. She's comin' back. Thar it comes; don't you see it? It's stoppin' now; they are comin' out of the coaches. Look! She said she'd come,' and with his arms uplifted, 'She's come!' Then the poor old heart beat out and he sank back limp and lifeless.

"So that's how Ben's mother come back. My wife says I'm gettin' daffy, like Ben, when I says this, but nobody but me and Bessie saw the look in his face when he held his hands up, and neither of us have ever doubted but that Ben's mother come back as she said she would. But, that's your train, stranger. Hope I haven't tired you out with my talking, but a night like this always makes me think o' the time when Ben's mother come. Be careful 'bout the platform; it's mighty slick and slippery."

DALLAS THEIS.

Church and State in France

BY YVES GUYOT

[The author of this article is one of the most distinguished republican publicists of France. He was for many years a member of the Chamber of Deputies and has been Minister of Public Works. He was for a long time editor-in-chief of the influential daily, *Le Siècle*, and is a frequent contributor to the leading periodicals of the United States, England and France. M. Guyot is friendly to the general policy of the present French Cabinet but strongly opposed to all forms of socialism. He is on the point of visiting America.—EDITOR.]

COUNTRIES where the majority of the population is Protestant have much difficulty in understanding the religious situation in countries where the majority of the population is Catholic.

In every Catholic country a clerical party is organized with the aim of getting control of public affairs. This party finds its support not only in the country of its origin, but at the Vatican, and it is always ready to sacrifice national interests to papal interests.

YVES GUYOT

France has had many sad proofs of this fact. Thus, the French expedition to Rome in 1849 prepared the way for the *coup d'état* of December 2d, 1851. From that time on the clerical party became more and more exacting. The policy of Napoleon III was contradictory. By the war of 1859 he began the unification of Italy, and yet, at the same time, he kept French troops at Rome so as to prevent the Italian Government from taking possession of the city, thus preserving the temporal power of the Pope. But this situation could not last. Now there is no longer any doubt that it was the Jesuits who, by their influence with the Empress Eugenie, brought about the war of 1870. Mr. Bolton King has proved this clearly in his "History of Italian Unity." They thought that if the French Emperor came off victorious they could force him to enter upon a clerical line of policy that would be to the advantage of the Pope. France could have secured in 1870 an alliance with Italy and Austria. But in order to obtain this, it would have been necessary to sacrifice the temporal power of the Pope. On July 23d, nine days after the declaration of war against Germany, M. Emile Ollivier, then Prime Minister of France, still refused to consent to this, and the Empress did not hesitate to declare, "I would prefer to see the Prussians at Paris than the Piedmontese in Rome." On August 3d, when the agent of Victor Emmanuel saw the French Emperor at Metz, this obstacle still blocked the way to an understanding between the two countries. It required the defeats of Wörth and Gravelotte before this absurd obstinacy could be vanquished. On August 19th, 1870, the Emperor sent Prince Napoleon to Florence, but it was then too late. Ratazzi, the then leader of the Opposition in the Italian Parliament, answered him: "The

EMILE COMBES

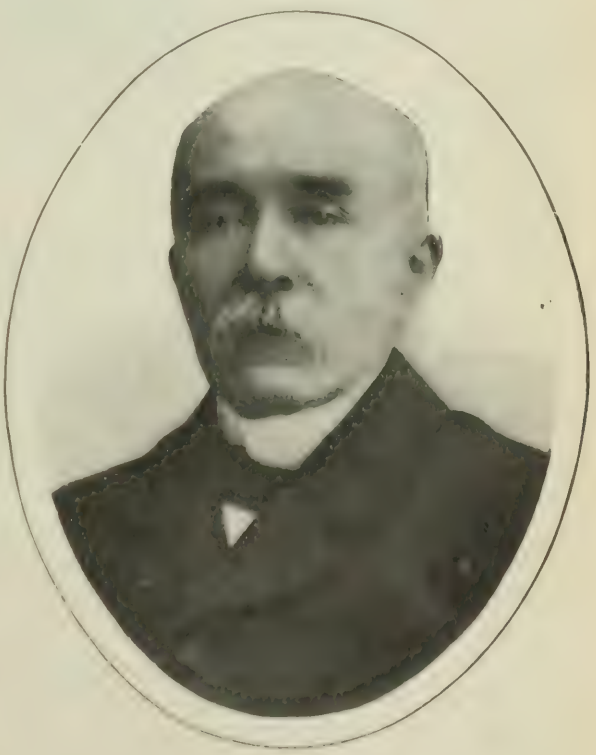
blood of Mentana cries out for vengeance." Mr. Bolton King adds: "The chain which linked Mentana was forged."

After the war of 1870 the reactionary majority of the French Assembly, elected on February 8th, 1871, and the whole body of the Catholic clergy, thought that the best way for France to repair the loss of Alsace and Lorraine was to re-establish the temporal power of the Pope. Most of the French bishops kept continually harping on the principles of the Syllabus in their sermons and circulars to the faithful. Their attacks became still stronger after the adoption of the present republican constitution. The political crisis of 1877, known as "the 16th of May," was the work of the Pope.

On March 12th, 1877, the Pope appealed to his bishops to stir up a movement against Italy, and, thereupon, the Catholics of all countries addressed petitions to their governments in favor of the temporal power of the Pope. On March 20th the members of the Right in the French Assembly called upon the Duke Decazes, Minister of Foreign Affairs, to act; on April 8th the bishops petitioned, and M. Jules Simon, then Prime Minister, alarmed, tried to stop the movement. Thereupon, Marshal MacMahon, then President of France, called for his resignation. This happened on May 16th. The starting point of this political crisis was, thus, at the Vatican. If the conspiracy of May 16th had succeeded, the foreign affairs of France would have been placed in a most critical position. As it is, this Jesuit, anti-Semitic, clerical policy had a repercussive effect on Franco-Italian relations. It pushed Italy into the Triple Alliance and caused her to associate her destiny with that of England. The good relations now existing between France, England and Italy are a proof of the discomfiture in France of the clerical party. The present aspect of the foreign policy of France is the result of its home policy, reflected in the bill passed on July 1st, 1901, concerning the right of association, especially affecting religious orders; reflected in the way in which M. Combes, the Prime Minister, applied this law, and again reflected in the law concerning the Catholic teaching bodies, which he introduced and carried through

The foregoing preliminary remarks will help the foreign reader better to understand the new conflict with Rome which France has just entered upon, and which is leading straight to the separation of Church and State. But now I take up the consideration of the immediately preceding contentions between the Vatican and the French Government, which have led up to the present more serious rupture. I refer, in the first place, to the law affecting the right of association.

The law passed on July 1st, 1901, is made up of two parts. Up to that date no government had succeeded in obtaining the abrogation of Article 291, and those following it, of the Penal Code, which prohibited more than 20 persons uniting in an association. This bill of the late M. Waldeck-Rousseau—for he was then Prime Minister—was the thirty-third on this subject introduced into the French Parliament since the year 1870. But he succeeded in getting his enacted into a law. In Articles 10 to 12 M. Waldeck-Rousseau had, with much cleverness, provided for the maintenance of liberty of association. There in Article 13 and those following he declared the conditions on which the re-



ligious orders might exist. Here is the text of this Article 13: "No religious order may be established unless authorized by a law, which shall determine the conditions of its organization."

Up to the time of the voting of this bill there were two kinds of religious orders in France,—the authorized and the non-authorized. The Jesuits, Dominicans, Chartreux, Capuchins, Franciscans, etc., belong to the second category. They had developed in complete liberty. Both categories had this in common,—they owned secretly property held for them by trustees. An investigation made by the treasury authorities showed that the property, taxed or untaxed, belonging to the various religious orders and convents was worth at a low price 463,000,000 francs; property taxed under the name of a third party, 608,000,000 francs, which makes a grand total of 1,071,000,000 francs.

The law of July 1st, 1901, was open to criticism; the problem might, perhaps, have been solved in another way. Forcing the orders to demand an authorization was making the State more or less responsible for them and, at the same time, was giving them a new source of strength, because of this very authorization. The bill as presented by the Government provided that these authorizations would be granted by the Government itself, in the form of a decree. But when the bill got before Parliament it was decided that the two chambers should pass on each authorization. This meant a great loss of time for the examination of these demands for authorization, and once granted by the Parliament, the monks were placed in a very strong position by the very manner in which they secured this authorization. In a word, the application of the law bristled with difficulties.

Immediately after the general elections for the Chamber of Deputies, in the spring of 1902, M. Waldeck-Rousseau resigned the Premiership on June 3d, his friends stating that the state of his health would not permit him to undertake to complete the work begun. Senator Combes, who had once filled the post of Minister of Public Instruction, and who had been chairman of the Senate Committee charged with reporting on the bill of which I am speaking, assumed the vacant post.

The clerical party now had recourse to the following tactics. In the first place, the rather harmless contemplative nuns were instructed not to ask for an authorization, which meant their forced departure from France. The leaders of this maneuver hoped by this means to awaken a feeling of public sympathy for the nuns and the cause. Furthermore, the nuns whose organizations were authorized refused to ask for an authorization for the establishments which they had founded, tho the new law obliged them to do so. Their aim was very plain. They wished to make the Government forcibly close these establishments. The region chosen for this campaign was Brittany, where the generality of the peasantry do not know the French language, and are fanaticized by their priests. There was a warm resistance and the Government had to call in the help of the army. The leaders hoped that the officers would refuse to obey and that a pronunciamento would be forthcoming from the army. The plan was not bad, but revealed a singular *naïveté* on the part of these clerical politicians. In three towns in the Department of Finistère, the doors of the establishments of the Daughters of

GEORGES CLEMENCEAU

the Holy Ghost had to be broken open, while the ardent defenders emptied on the heads of the police and the armed constabulary the contents of the slop-pails. At Pontivy and Brest some of the army officers refused to obey orders, and were, in due season, punished and expelled from the army. The character of this resistance provoked disapproval instead of sympathy, and the Combes Cabinet came out of the fight not weaker, but unquestionably stronger, everybody, except the pronounced friends of clericalism, recognizing that an end must be put to this unscrupulous conduct.

Some of the friars had asked for an authorization. So in December last M. Combes laid before the Chamber of Deputies 54 bills, whose purpose was the refusal of authorization to as many convents. The question then arose, Would the committee make 54 separate reports and would there be 54 distinct debates on the floor of the Chamber? It was also asked, How many requests for authorization would be likely to come from the nunneries? The time at the disposal of the Chamber was not limitless. Finally, the difficulty was got over by the Chamber deciding to reject in a body all the requests for authorization coming from the friars, which course was also adopted by the Senate, notwithstanding the opposition of Senator Waldeck-Rousseau, the last speech of this celebrated orator.

But I fear that it is not so sure that we have at last got rid of these troublesome monks. The orders reappear in a different shape. The Jesuits, for instance, have laicized themselves, and in this form continue to teach. The courts do not agree in their decisions on this perplexing question. In a word, the law of 1901 has not, unfortunately, solved this difficult problem of how to put an end to the clerical education of the French youth. Even those who come to the defense of the friars in the name of "liberty of instruction" admit that the question reduces itself to this: Whether it is the State or the Church which is to keep school. The real importance of the matter is seen when it is remembered that this clerical system of instruction is simply a political machine, whose aim is to assure the domination of the Church and to hold in check the whole political, intellectual and social movement sprung from the French Revolution. It sets up the Syllabus in opposition to the Declaration of the Rights of Man and the Civil Code; it inculcates the supremacy of the religious over the civil laws.

The predominance of clerical instruction was brought about in France during the reactionary period, which preceded the *coup d'état* of 1851 by a law named after its author, the Falloux bill. Thanks to this law the Jesuits and the Dominicans were able to establish flourishing schools, whose special aim was to prepare young men for the great State engineering, military and naval schools. Thus were they able to fill with their pupils the high public offices and the army and navy, who were closely bound together, who were backed through life by the strongest influences, and who were thus able not only to aid one another, but also in a position to push aside independent rivals. The modification of this Falloux law was a necessary consequence of the law concerning associations.

It was on December 18th, 1903, that M. Combes laid before the Chamber of Deputies a bill demanding the suppression of clerical instruction of every grade. It applied to authorized as well as to unauthorized orders. The authorized society of the Brothers of the Christian schools has not less than 1,452 institutions, while 374 nunneries possess 574 schools, and to these should be added 1,621 other schools kept by mixed orders. These make a rather formidable total.

When this bill shall have been passed in both houses no order may teach. But in the bill as proposed by the Government the Minister of Public Instruction was given a delay of five years in which to complete the work of closing all the convent schools, and this delay was lengthened to ten years by the Chamber. Notwithstanding a formidable opposition, the bill passed the Chamber of Deputies, and was also carried through the Senate just before adjournment last July. Instead of fighting the bill openly, some Deputies tried to accomplish their end by overturning the Cabinet. They failed, however, and M. Combes has come out of the struggle stronger than

ever, a fact confirmed by the result of the municipal elections held throughout France last spring, which were decidedly favorable to the Government, and the election for the councils general or provincial assemblies, which occurred this past summer, which also showed that the country is backing M. Combes.

In all Catholic countries, in France, in Belgium, in Italy, in Spain, the Liberal Party is anti-clerical. Everywhere it demands the suppression of religious orders, the limitation or total suppression of mortmain and the substitution of laical for religious teaching. The Clerical Party is simply playing upon words when it pretends to be liberal, when it declares that it is fighting for the liberty of a father to choose how his children shall be educated, when it battles for liberty of instruction. The late Louis Veuillot, the well-known Catholic journalist, has, with an audacious cynicism, well *résuméd* its doctrine: "We demand from you liberty in the name of your own principles and we refuse it to you in the name of our own principles."

JEAN JAURÈS

The Concordat is based on a mistaken idea. Bonaparte wished to complete his temporal power by closely associating it with the spiritual power. Thus, at Paris he would have a prefect of police and an archbishop; in the department capitals, a prefect and a bishop, and in the chief towns, a parish priest and a justice of the peace. The oath required of the bishops, in accordance with the sixth article of the Concordat, smacks of a police regulation: "If I learn of anything in my diocese or elsewhere that is detrimental to the State, I will inform the Government of it." Napoleon thus created a hierarchal organization, which the faithful were forced to submit to without having anything to do with its creation or working. He imagined that he had set up an institution which he would find useful. But he soon found out his error, for it immediately began to work against him.

The Concordat confers on the French Government "the right to name the bishops." But the Pope, then Pius VII, refused the investiture to those bishops whom he did not approve of. Thereupon the Emperor seized His Holiness and imprisoned him, first at Savone and later at Fontainebleau. He shut up the cardinals in the smaller French towns. Nor did even the humble priests escape his Imperial wrath. When the Bourbons came back, in 1815, they found some 500 parish priests under lock and key in the jails. It is reported that Napoleon said of the Concordat, while at St. Helena: "It was the great mistake of my reign." Whether he said so or not, it is quite true.

After the lapse of a century we find the Pope claiming the same prerogative. Leo XIII winked at his clergy's coquetting with Boulangism and Nationalism, but felt that if the Concordat were abrogated the Papacy would suffer an irreparable blow. Pius X is, however, quite ignorant of the ways of the world. He believed that the French Government would never dare to look squarely in the face the possibility of separation of Church and State. Hence his insulting circular to the French Minister of Foreign Affairs, complaining of President Loubet's visit to the King of Italy, or, rather, his return visit, and his more recent assumption of the right to revoke at will French bishops, regardless of the

Concordat, a very simple way of annulling the Government's appointment of any bishop deemed by the Pope not sufficiently subservient to the Vatican. By these acts the present Pope has shown the absurdity of the Concordat and the crying necessity of the separation of Church and State. It has always seemed to me that Jules Ferry made a grave mistake in not bringing this about in 1881, when he had his famous conflict with Rome. Now it appears to me inevitable.

I should like to see this reform carried through on lines laid down in a bill which I introduced into the Chamber of Deputies in 1886. The central idea of my bill was the handing over to the municipalities, as a perpetual annual grant, the 41,000,000 francs now paid out for church affairs, and also the church buildings themselves. Then each municipality would decide what to do with its share of this sum, whether it should be employed for religion, education or charity. The clergy would then be quite severed from the State. This would be the decentralization of the religious conflict, which weighs so heavily on Catholic countries and places them in a situation that renders them inferior to Protestant countries, where this tormenting question is unknown.

PARIS, FRANCE

The Quest

BY WILLIAM HERVEY WOODS

"IF Love hath balm to heal men of their woes,"
(I cried to Love's queen-flower),
"It is the dew-drop in thy heart, O Rose;
Now let me taste its power!"
My Lady Rose bent low her beauteous head,
I heard this whisper break,
"Love heals no hurt"—she sighed the while she said—
"Save that Love's self did make."

Then to the Laurel I, "If wreathéd Fame
Of thy proud leaves distils
The soothing nard that Orient seers proclaim,
Wilt thou not ease mine ills?"
Answered the leaves, "Were that thou prayest upon
In all Fame's kingdom found,
King Arthur had not gone to Avalon
To heal him of his wound."

"Teach me thy sorcery, thou drowsy bloom,
(I prayed the Poppy red),
"Let me who cannot flee forget my doom,
On thy dark balsams fed."
Breath of the flower across my senses stole,
A hushed voice murmured, "So
Men drown To-day; but on To-morrow roll
Immeasurable woe."

Remained the Vine, and I with Bacchus train
Lolling in wanton ease,
Heard Omar babbling in virulent strain
Melodious blasphemies,
But found no help; nor dared I, like him, prone
Along the wine-stained sod,
Assume the judge, and for the sins mine own
Hands wrought, forgive my God.*

But in the last black gateway toward despair
Methought one took my hand
And led me up a barren hillside where
One tree looked o'er the land;
"O seeker for the balm of Yggdrasil,"
He said, "behold the tree!"
I looked, then trembling scanned the barren hill—
And lo! 'twas Calvary.

* Rubaiyat LXXXI, Fitzgerald's version;
——"For all the Sin wherewith the face of Man
Is blackened—Man's forgiveness give—and take!"

The Close of the Session in England

BY JUSTIN McCARTHY

THE Session which has just come to its close in Westminster Palace has been the subject of bitter and scornful criticism from all the Radical newspapers, and, indeed, has received but qualified and stinted commendation even from most of the Conservative journals. Now, I, as a disengaged observer of political life, feel much tempted to sound a note of my own and to proclaim that the Session has been, in its own peculiar way, the most valuable we have had for many years. But then I would ask my readers to bear in mind that I only say it has been thus valuable in its "own peculiar way." In other words, I am inclined to contend that the Session has been of immense service by holding up to us an almost perfect illustration of what a Session ought not to be. Never within my recollection has there been a Session which accomplished so little and of which it has also to be said that the little it did accomplish would have been much better left undone. Now I think any calmly philosophic mind must be ready to admit that if a Session or an individual cannot show us what we ought to do, the Session or the individual has at least rendered us a distinct service by showing us what we ought not to do. In the case of the Session, moreover—I mean of this particular Session which has just passed—I hold that the lesson is not merely negative, but to a great extent positive, and in giving an example of what ought not to be done it unconsciously expounds to us and exhibits to us the causes of the wrong-doing.

We must bear in mind that the Session which has just closed was working under the auspices of the changes made by the present Government in our Parliamentary system, with the avowed object of accomplishing a greater amount of legislation with a lighter and lesser amount of toil to the over-wearied legislators. Quite a number of new measures were carried by the Government, since the opening of this present Parliament, having for their object the limitation of the time given up to each day's sitting, and enabling members of the House of Commons to have their "week-ends" quite free for rest and recreation. Under happier conditions this change in the rules might have worked successfully, but the late Session showed conclusively that as the Imperial legislature is still arranged it meant nothing beyond a further delay in the business. The members got their additional hours of relaxation if they chose to make such use of them, but the business of Parliament lost so much time that the most important measures had to be let drop for the plain reason that the old work and the new holidays could not be managed within the allotted months.

The one great source of difficulty is that the House of Commons has far more work put upon it than it can possibly accomplish within the duration of each Session. This fact has been becoming more and more apparent for many successive years, and the reason why I hold the late Session to have been a model in its way is because it has made itself the most striking illustration we yet have seen of this constitutional defect in our Parliamentary system.

The life of the House of Commons at present is a mere struggle among several contending parties or sections, each of which wants to get some particular work done and each of which has to fight against all the others for the opportunity of doing it. The first step toward the remedy of this increasing and portentous trouble must be the concession of Home Rule to Ireland. I am very proud as an Irishman of the part my countrymen have taken in pressing forward against whatever opposition the measures which they believed essential to the prosperity of Ireland. I spent a very considerable part of my life in their companionship for the carrying on of such work. But if I were an Englishman and mainly concerned about England's

HUGH CECIL

political progress I should certainly feel a very strong objection to the political system which allows a very large part of the time of the House to be taken up with the discussion of Irish local affairs, which could be managed much more satisfactorily by an Irish National Parliament. Under the present arrangements the local business of Ireland, Scotland and Wales has to be conducted in the House of Commons at Westminster, and I need hardly say that the one chief result of this plan is that none of the business is done or can be done to the satisfaction of any of the nationalities which are concerned in it. One result of this is that each nationality is now and then led to regard the others, and more especially that of England, as merely engaged in obstructing the work of its rivals. The Welsh members are lately becoming a very important organization under the leadership of that most eloquent debater and orator and clever Parliamentary tactician, Mr. Lloyd-George, and they have often joined with the Irish members in endeavoring to press forward measures which Englishmen, trying to force on their own legislation, are endeavoring to obstruct.

There is according to my judgment but one way out of this ever-growing embarrassment, and that is to enable each country, England among the rest, to do its own local work in its own National Parliament, and allow the legislation which concerns alike all parts of the kingdom to be discussed and disposed of by an Imperial House of Commons sitting in Westminster. Home Rule for Ireland will be, we may take it for

WINSTON CHURCHILL

granted, the first step in this movement of enlightened reform. At present we hear much rumor to the effect that the next Liberal administration will endeavor to put the Home Rule question aside and to treat it as a question no longer calling for immediate practical consideration. I venture to predict that any Liberal administration which endeavors to act on this assumption will find out its mistake before it has been many weeks or even days in power, and will feel itself compelled to fall back on the policy of its greatest modern leader, Gladstone, and to make Home Rule for Ireland its first important achievement. I am, therefore, driven to regard the late Session of Parliament as full of the best hope for the future, because it has shown more clearly and more effectively than any

other of late years how completely our present system has broken down and how utterly and inherently unsuited it is for the rule of a State made up of several different and absolutely distinct nationalities.

The men who made most mark in the late Session belong neither to the party officially in power nor to what is called the front bench of Opposition. These men are undoubtedly Mr. Winston Churchill, son of the late Lord Randolph Churchill; Lord Hugh Cecil, son of the late Lord Salisbury; Mr. Lloyd-George, the Welsh leader, whom I have already mentioned, and Mr. Redmond, leader of the Irish National Party. The front Opposition bench has not shown itself strong in the Parliamentary and com-

DAVID LLOYD-GEORGE

bative sense. Sir Henry Campbell-Bannerman has great ability and can make a good speech with a certain dash of genuine humor in it, but he wants that hardly definable quality which in ordinary language we describe as "go," and he has not the faculty of rousing his followers to any strenuous efforts. He has by his side two men at least of really commanding ability, Mr. John Morley and Mr. James Bryce, but neither of these men is by constitution a parliamentary fighter, and they are both great thinkers and great authors rather than ardent promoters of a genuine fighting policy. Therefore, the Opposition, at least that part of the Opposition which is represented by the front bench, made but a poor show of it during the late Session, and never seemed to have any policy to put forward which could arouse the Liberalism of the country to rally to its support. The General Election cannot be very long delayed, and when that comes on we are sure to see the Liberals again in power, and then no doubt when the time comes the leader will show himself.

The sea-coast town, or rather village, close to which I spend so much of my time, has now a visitor whose coming is very welcome to me, Sir Henry Drummond Wolff, who is taking a well earned rest after his long and brilliant services as British Ambassador in many foreign states. I first came to know Sir Henry Wolff nearly a quarter of a century ago, when he was a member of the House of Commons. He held, indeed, a very conspicuous position even then, for he was one of that famous Fourth Party led by the late Lord Randolph Churchill.

SIR HENRY DRUMMOND WOLFF

The party was called Fourth because there were already at the time of its formation three parties in the House, the Liberals, the Conservatives and the Irish Nationalists. But the Fourth Party consisted of only four men, Lord Randolph Churchill, Arthur James Balfour, now Prime Minister of England; Sir John Gorst, still an influential member of the House of Commons, and Sir Henry Drummond Wolff.

During my early Parliamentary career my political colleagues and I occupied seats in the House close to those retained by the small Fourth Party, and I had, therefore, ample opportunity for making the personal acquaintance—I hope I may say the personal friendship—of Sir Henry Wolff. When he left the House and entered the diplomatic service I lost sight of him for many years, and it was a genuine delight to me to come into association with him once again in this quiet out-of-the-way region. The reader can easily understand that Sir Henry and I have had many long talks already about the old days in the House of Commons and the men whom we knew there and the changes which have come about since those now somewhat distant days, and Sir Henry is one of the brightest and most interesting talkers I have ever heard. His varied experiences in foreign courts have enriched him with a wealth of anecdote and illustration, and he is at the same time a thoroughly original observer and thinker. He is accompanied by his charming and devoted wife, who has been his life-companion.

In my last article I had something to say about the new and popular edition of Mark Rutherford's works, which is now in course of publication by Mr. Fisher Unwin. The second volume of the series is called the "Revolution in Tanner's Lane," and is in its way and in its peculiarities one of the most remarkable books I have read for a long time. The Mark Rutherford story was put in the shape of an autobiography, and was, therefore, mainly a study of one character, altho every figure introduced into the narrative, even if only a passing figure, was touched off to the life and made in fact to live. "The Revolution in Tanner's Lane" has more of the elements of the story in it altho it is not constructed in any sense on the plan of the novel which is popular in the circulating library. It tells a story, indeed, but the interest of the story is found almost entirely in the study of character and not in the array of events. It is a picture of the life of a dissenting community, or, indeed, of more than one dissenting community, in some outlying quarter of an English town, and it carries us back to the early days of Queen Victoria's reign. Indeed, perhaps, I should rather say that it brings us down to those early days of the Victorian reign, for some of the leading personages we meet in the story had accomplished the greater part of their life-work before that reign began. It is almost exclusively a story of the classes who do not belong to what is called society. The figures with which we are made acquainted are those of men and women who are themselves poor and of some few who stand, indeed, above the level of the actual working class, but are merely small traders or insignificant manufacturers, and of the religious preachers and teachers who minister to such obscure orders. The reader who is unacquainted with Mark Rutherford's writings would hardly believe when he opens the "Revolution in Tanner's Lane" that he is entering upon a narrative which is destined to fascinate him as many a romance of what is intended to be thrilling in its interest may have utterly failed to do. There is humor of the most genuine kind; there are touches of pathos here, there and everywhere which reach the heart; a class of life which at first seems utterly commonplace, mean and vulgar is shown to have its deep problems in it, its poetic emotion, its startling contrasts, its tragedy even where no tragic incident whatever is brought into the narrative. The study of character is positively scientific in its accuracy, and yet the author never seems to be like a practitioner going to work at the dissecting table, but is a painter of living forms.

I have a strong impression that this story will be read with great interest in American communities, who, after all, are not likely to know any less about the people and the conditions described in the book than are most of our novel-reading classes here in England. I do not feel much inclined to spend time in

testifying to my critical power by pointing out defects in a work which I admire so much, but I may perhaps say that the author is not so artistically skillful in the construction and the sequence of the story as he is in his analysis of human feelings and in his pictures drawn from the life. That, however, is not a very great fault, and it does not in the least prevent the reader from entering with the deepest interest into the struggles and rivalries, the efforts and the ambitions, the loves and hates and sufferings of the obscure set of commonplace individuals who are associated with this revolution in Tanner's Lane. There is, indeed, if I may judge from my own experience, a frequent feeling of wonder in the breast of the reader—of wonder how or why he has come to take so intense an interest in the lives of those personages, not one of whom could possibly be described as a hero or a heroine, not one of whom has done a great deed or has suffered any trouble which is not common even among the most commonplace. I shall be greatly surprised, indeed, if these books do not even yet win for their author a place among the foremost novelists of his time.

London, England.

Eastern Universities and Western

BY E. BENJAMIN ANDREWS, LL.D.

Chancellor of the University of Nebraska and Ex-President of Brown University

THE most accommodating meridian imaginable would form a very imperfect boundary between pattern and pattern in American schools. A survey of universities so general as this necessarily takes the State university as the type, tho, of course, the West boasts many educational establishments of high standing reared upon Eastern models. The Northwestern University and the University of Chicago occur to all. Oberlin is a New England college *in partibus*. So is Iowa College, at Grinnell. A score of others might be named.

The University of Vermont, on the other hand, is a State institution, and so, in a sense, is Cornell. In spirit, too, Cornell reminds one of the West, as the University of Chicago does of the East. Adapting Senator Depew's remark about Mr. Roosevelt and Mr. McKinley, you might denominate Cornell an Eastern university with Western ideas, and Chicago a Western university with Eastern ideas.

In no other point are East and West more alike than in their institutions of high learning. Our entire educational system had origin in the East and from practically one and the same set of motives. Probably, even to-day, a majority of the instructors in nearly every Western faculty graduated at the East or studied there as graduates.

This is, of course, rapidly changing. Home-bred men more and more come forward whom broad travel and study, added to the attainments they made as undergraduates, fit for the highest teacherships. As a rule, such faculty members compare favorably in culture, information, and especially in disciplinary and teaching efficiency, with the ablest of their colleagues.

Certain longitudinal differences can, after all, be traced between our learned institutions—differences very real and worthy of remark, tho hard to define with exactness.

The most sensible of these unlikenesses is set up by the age and venerableness of the characteristic seats of learning in the East, to which Western universities, creatures of yesterday or to-day, cannot lay claim. No popularity, no populousness, no wealth, no splendor of record, no amount of influence can take the place of that subtle but imperative charm which ties each Eastern alumnus to his alma mater, in view of her being hoary with years. If you were schooled upon a foundation laid before the Revolution; if,

as a collegian, you walked a campus and sat in seats familiar to this or that hero of the war of 1812, or flourishing in Congress or in letters when only red men occupied the prairies, a *sui generis* pride, joy, inspiration attends your reflection upon college life into which Western graduates cannot enter.

In any of the old universities the governing body is a private corporation, self-perpetuating, save as, in some cases, a certain proportion of members is elected by the alumni. Spite of this infusion, the private corporation remains dominant. The general public has no voice in the institution's policy and can make its wishes felt there only through public opinion and the press, the means to which it is shut up in influencing churches and clubs.

With the State universities this is very different. Each board of control is either elected directly by the voters of the State or appointed by the Governor, who is, of course, so elected. Western universities thus express the people's regard for higher education and its wishes thereupon with a directness which Eastern institutions cannot match.

This, their trust as the fundamental curators of high learning, the people have, on the whole, discharged nobly, making the most generous provision, both mental and material, for teaching and research. From the form of government noted it might have been feared that political influence would pervert university administration. Cases of this have no doubt occurred, but they have been exceedingly rare—less common, I think, than in institutions dependent upon private gifts. In nothing have the people of the West displayed higher character than in their zeal for promoting and their sanity in managing high education.

At the moment of deepest agony from drought in the worst drought year which ever visited the West, a legislature which had just voted aid to keep needy farmers' families from starvation till next harvest time took up the question of completing a library for the State University. So distressing was the financial situation that even the head of the university dared not urge his darling project by a word; yet, after mature deliberation, the appropriation passed by a nearly unanimous vote.

Boards of university control are usually smaller West than East, a plan which tends to efficiency. In a large board few members have much sense of responsibility. In a corporation of six some feeling of the kind reaches every man. All recognize obligation to attend each meeting, endeavoring to maintain grasp upon the main items of business. Affairs are but to a slight extent parceled among committees. The head executive need not, as must be done with unwieldy boards, see his business first through a committee and then through the plenum. He meets the plenum itself, and this sufficiently often, lays before it his proposals, which are at once considered, acted upon, and, if favored, given the form of law. Members are under no temptation to "play to the galleries" or separate into partisan cliques. On the contrary, everything tends to sincerity and directness. They sit around a table, look each other in the face and discuss with freedom and informality. There is chance for the executive to advise with them touching measures not yet ripe for legislation—a most advantageous possibility unknown where the board forms a multitude.

Western faculties are recruited among the most promising *savans* from the East and from Europe. Every large Western faculty comprises variety of gift beyond almost any Eastern faculty. Most Eastern institutions, in keeping up and enlarging their faculties, "breed in and in." If one of your own graduates will do for a place he is likely to be elected against a superior candidate not an alumnus. The quality of many an Eastern faculty has been thus kept down. Not so anywhere West. The best men are sought and retained irrespective of the question where they have received schooling.

It results that the *personnel* of the progressive Western faculty is charmingly and usefully cosmopolitan. It represents the best training institutions in the world. Methods from all the foremost teaching centers in Europe and America are here in vogue, competing with one another and giving opportunity for the best to prevail. A variety of mutually supplementary methods is often found in one and the same department, inestimably enriching its work.

At no Western university is the teaching force in danger of senility. Nearly all faculty members are young, working for their spurs, and it is well known that such often teach better than older scholars whose fame is secure. The elderly professor who never did aught in his life save faithfully to draw his salary, never inspired a pupil and never published a research, but has, through sheer lethargy on the part of the board employing him, continued to "hold down" his chair, is not found in any Western institution of rank.

In dealing with the tenure of university teachers the West enforces the competitive principle more rigidly than the East does. It is not thought that a professor who has grown inefficient has a right to his place simply because he has wrought long for the institution, even if his service has been satisfactory. In some cases application of the competitive principle appears cruel, and it may now and then be so in fact; but, generally, the procedure is commendable. None who compare institutions where it prevails with those using greater apparent clemency can doubt which is the juster policy on the whole and in the long run.

University teaching is very considerably more energetic West than East. This is in part due to considerations named above, but there is also a new one of great weight—namely, the pressure to hard work put upon professors by students. A colleague once said to me: "When we taught in the East we were obliged to be all the time prodding our pupils. Here the tables are turned; our pupils are all the time prodding us." In this part of the country a lazy instructor would be very miserable. If his courses were elective he would soon be without classes. Here one never hears students complain that their tasks are too severe, tho such criticisms might be just.

University library facilities are less ample and various West than East; but, so far as students' needs are concerned, the disparity is more apparent than real. All over the world old libraries largely consist of material which neither students nor professors, nor even investigators of the recondite, ever use. The books are simply lumber, not to be burned, yet requiring precious room, besides large expense for oversight and care.

The typical university library at the West is made up almost entirely of usable stock. It is primarily a working library for professors and students, with a fair outfit for deepest research. The books are up-to-date. A large proportion of the yearly expenditure is for current periodicals of the first order.

And the books are used—in fact, very rapidly used up. Nothing surprises an Eastern college man in a Western college library more than the shabby appearance of the books. This offends him till he learns the cause, when his disgust turns to admiration. The sorry look of the books is not due to maltreatment; on the contrary, the utmost care is usual in handling them; but they are read with such unremitting assiduity by student after student that no amount of care keeps them presentable.

Every State university has from the first cherished ambition to be a university indeed and not a mere college. Perhaps this has in some cases directed effort to investigation and to graduate teaching at the expense of college work, but the university ambition has in the main wrought well. Prompted to advanced researches that they might carry along classes of graduate students, professors have enriched all their teaching down to the most ordinary elements. Virile college instruction cannot be kept up very long in any other way.

Regrettably, classical letters are not popular in the West. The remission of Greek, in particular, has become painfully common. Few high schools teach it, and college classes pursuing it are small. But for the denominational colleges of the West, which deserve the utmost credit for encouraging Greek, the situation in this respect would be deplorable indeed.

Culture studies as a class have to fight harder at the West, owing to the terrific pressure of scientific pursuits. Few sophomores—and who can blame them!—like to grind at Aristophanes or Titus Livy, while knowing that their attainments as surveyors, machinists, or in scientific farming or stock breeding will assure every one of them a thousand a year from the day he leaves the university.

Spite of such pressure *contra*, the humanities win devotees year by year. History and literature have already come to their rights. Courses in the history and

criticism of the fine arts are common and numerously attended. Much instruction is given in the practice of painting, sculpture and music. Music is cultivated in Western institutions of learning much more sedulously than in those of the East. I recently heard "The Messiah" rendered by the undergradute amateurs of a prairie university with a perfection which would have done credit to professional musicians. Such a performance, I think, was never undertaken by student talent in any Eastern university.

A peculiarity which the State universities do not share with any of their great mates East is co-education proper, the admission of women on the same terms as men to all departments of instruction without exception. No limitation of this liberty to women would be tolerated or even thought of by any State university.

At each of three quarter-centennial celebrations, recently held by as many flourishing State universities co-education received praise at once ample, unconditional and spontaneous, evoking no dissonant voice. In none of these university circles, apparently, had a word of scandal arising from the practice of co-education ever been heard. Such testimony is general.

Nor has any State university felt the difficulty which Oxford and Cambridge opponents of co-education dread, which same, it is understood, led the University of Chicago to substitute for co-education the co-ordinate education of the sexes—viz., morbid repression and self-consciousness on the part of men students, occasioned by the presence of women in the same classes with them. The State universities find, I think, that women's influence works help to the men rather than hindrance. In the standard portions of the curriculum women always average, according to the usual class-room tests, to rank higher than men. They work more steadily; they have superior verbal memory; they pass better examinations. All this is good stimulus to the men, who, meantime, average to be surer than the women to seize and remember the logical elements in what they learn, and to remain efficiently studious years after graduation.

There can be no doubt that the great State universities of the West are henceforth to be prominent factors in American higher education. Should any consider that our account of them thus far has been too favorable, what follows may serve to dress the balance.

A Western professor, besides being nearly always overworked and underpaid, is at great disadvantage in situation, far from most peers laboring in his department. Unlike faculty men East, he cannot without great expenditure of time and money meet co-laborers in discussions or conferences or in formal conventions. Here is a serious handicap. He can read, and he does; but books and *brochures* are but a poor substitute for *viva voce* presentation and debate.

All higher educational work West suffers from the imperfect home and school training of most students. Tho not unknown, those cultivating family and neighborhood influences which, in many an Eastern community, endow youth with the essentials of culture even before they enter college, are as yet rather rare in the great West. Happily, this local dearth will soon pass.

College spirit "out West" is for the present seriously weakened by the fact—this is my interpretation—that most higher education throughout the section is State-supported. Free tuition for all bachelorships was at first a necessity and has wrought incalculable benefit in all the newer communities of our country, but, like the sunshine, it is abused. Judged by the Eastern standard, Western college people are deficient in gratitude for academic privileges, taking these, like their common school education, as a matter of course. Alma mater's image is thus painfully belittled in many souls. College spirit lacks flavor, fervor and depth. If the majority of our graduates are more or less warmly loyal, few are passionately so. All this will change.

"It is, sir," said Webster, pleading for Dartmouth before the Supreme Court of his country, while tears stood in reverend judges' eyes—"it is, sir, a small college, but there are those who love it."

Love like this should spread West, for it is due. The average State university alumnus is more deeply indebted to his alma mater than any one could have been to Dartmouth when Webster spoke those words in 1818.

Lucas, Neb.

Literature

Concerning the Mode of Evolution*

It is interesting to notice the attitude of writers and investigators toward the doctrine of evolution. Some of us remember the fierce opposition of a certain class of men who could not accept so new and revolutionary a theory; the doubting hesitancy of others who found so many lions in the way that they feared to follow it; the candid, intelligent adoption by those who held theory and hypothesis to be merely the present explanation of the facts at our command; and, finally, the exuberant and somewhat frantic acceptance of the new doctrine as the final and complete explanation of all things by still another type of writers. The latter may be likened to those in the parable who received the word with gladness "because they had no deepness of earth." It would not be difficult to find a likeness to each of the other characters, but the reader can easily do this for himself. It is fortunate that there are always some "that heareth the word, and understandeth it," for in them "it beareth fruit and bringeth forth some a hundredfold, some sixty, some thirty." It is through the latter that progress is made, for these are the only ones who bear fruit of any kind. Those who fiercely opposed have disappeared; those who feared and hesitated are no longer with us. The joyous and excitable souls who were such zealous evolutionists have long since found other and later theories with which to entertain themselves and amuse their friends.

Professor Morgan's book is at once interesting and suggestive. He first states the problem of adaptation, illustrating the kinds of adaptation by examples taken from various plants and animals. As to the theory, he distinctly gives his adherence in the first paragraph of the chapter where he says that "the plant or the animal is so constructed that it is suited to a particular set of physical conditions," and "it may so respond to a change in the outer world that it further adjusts itself to changing conditions." Yet he is very critical when he comes to particular cases, as is indeed quite proper, for there can be no question that there is much danger here of being too believing.

In a similar spirit the professor examines the general theory of evolution. In order to avoid confusion he uses the term "transmutation" instead of "descent," the former including the idea of modification, which the latter does not. That the full meaning of the theory of transmutation is grasped by him is shown by his attitude toward taxonomy, regarding which he says:

> "We should always keep in mind the fact that the individual is the only reality with which we have to deal, and that the arrangement of these into species, genera, families, etc., is only a scheme invented by man for purposes of classification. Thus, there is no such thing in nature as a species, except as a concept of a group of forms more or less alike. In nature there are no genera, families, orders, etc. These are inventions of man for purposes of classification."

Two chapters are given to a critical examination of Darwin's theories of artificial and natural selection, and a third to the theory of sexual selection. These theories are set forth with much candor and fairness by the free use of quotations, and along with these the author keeps up a lively running fire of comment and criticism, which often negatives the force of Darwin's argument. Professor Morgan's criticisms are especially destructive in regard to the theory of sexual selection, and he closes the chapter with these words: "In the light of many difficulties that the theory of sexual selection meets with, I think we shall be justified in rejecting it as an explanation of the secondary sexual differences amongst animals." But he says further, "Other attempts to explain these differences have been equally unsuccessful."

* Evolution and Adaptation. *By Thomas Hunt Morgan, Ph.D.* New York: The Macmillan Company. $3.00.

In the chapter on the inheritance of acquired characters one finds a concise statement of Lamarck's theory that acquired characters are transmitted from parent to offspring, and with it such a keen criticism that we are prepared for the author's verdict of "not proven," accompanied with the suggestion that it may be "unnecessary and even improbable." A little later Mendel's law and the mutation theory of De Vries are sympathetically stated, and it is easy to see here that the author has a bias in favor of these new views. Any one who wishes to read short and clear statements of these theories can find them in this book. Protective coloration (mimicry), sexual dimorphism, secondary sexual organs, increase of organs through use and decrease through disuse, reactions of organisms to poisons, and regeneration, are all discussed, with the general result of disagreement with Darwin's views as to the origin of such adaptations and agreement with the theory of mutation.

Throughout the book there is shown a great dislike for any theory which involves gradual changes, and a similar dislike for one involving selection. The author carries this so far as to attempt to minimize the results of artificial selection as practiced by breeders. The reader must not forget this very marked bias of the author or he may come to the conclusion that "variation," the "struggle for existence," "natural selection" and the "survival of the fittest" have disappeared from the field of scientific biology, and that fortuitous "mutations" may account for all of progress that we see in plants and animals. Such a conclusion, to say the least, is not yet warranted.

War and Neutrality in the Far East

We commend this little book* to those whose interest has been sufficiently aroused through the startling details of the titanic struggle between Russia and Japan to inquire into its causes, its import and some of its lessons as affecting international law.

Mr. Lawrence has done wisely for the benefit of such inquirers in assembling in book form the substance of his four lectures, recently delivered at Cambridge University.

Mr. Lawrence brings out clearly the diplomatic means employed by which Japan at the behest of Russia, momentarily supported by France and Germany, retroceded to China the Liao-tung peninsula—the apex of which is Port Arthur. Japan, by this act, demonstrated to the world that having secured to the Hermit Kingdom its independence from China, her object in going to war at all with China had been fulfilled.

Nor did Japan, through her virtuous retirement from off the mainland of China, show any undue resentment over the fact that China leased to Russia, for the purpose of according to Russia an ice-free outlet on the Pacific to her trans-Siberian railway system, Port Arthur, Ta-Lien-Wan, and a substantial slice of territory to the north.

It was only when Russia evinced the disposition not to let well enough alone, but to mix by intrique in the affairs of Manchuria and in the affairs of Korea in an aggressive way, that Japan stood pat, so to speak, on the principle that Russia's sway in Manchuria was to be restricted, and that Korean independence (for which Japan stood sponsor) was to be respected. In the insistence of her firm stand on these two points the Japanese Government finally broke off diplomatic intercourse with St. Petersburg by expressly stating that "The Imperial Government reserve to themselves the right to take such independent action as they may deem best to consolidate and defend their menaced position, as well as to protect their established rights and legitimate interests."

This note—the precursor of the imminence of war—was transmitted on the 6th of February. Two days later Japan's torpedo boats dashed into the harbor of Port Arthur, wrought terrible havoc and the overt act of war was consummated. By placing these facts lucidly before the reader, Mr. Lawrence removes forever the stigma which Russia endeavored to fix upon Japan of treachery in its method of precipitating this war.

As an authority on international law Mr. Lawrence shows himself to be a just

* War and Neutrality in the Far East. By T. J. Lawrence, M.A., LL.D. New York: The Macmillan Company. $1.25.

recorder of the phases of this conflict, pointing out their import as they have affected some of the mooted and still unsettled questions of the comity of nations. His treatment of the rights of belligerents as well as of neutrals with respect to contraband of war is happy, and is in accord with the views that obtain in Washington and at the Court of St. James in regard to the recent action of Russia's volunteer fleet in the Red Sea and her Vladivostok flying squadron in molesting neutral shipping.

These and other questions, such as the position in international law of Korea and Manchuria, are ably treated. Altho conclusions show that Japan in the main has acted more strictly in accordance with the best traditions of international law than has Russia, yet we feel that these conclusions are just, unbiased, and arrived at with a fullness of knowledge of his subject. And in these conclusions the reader finds himself unconsciously concurring.

Elizabethan Sonnetry

THESE recent volumes * of the reissue of Arber's "English Garner" form a very convenient, tho not the sole accessible, source for the study of the most important Elizabethan love sonnets. The value of the book is slightly impaired by defective editing. The text is Arber's, with the addition of a little new matter, which brings the total number of sequences up to fifteen, including work of Sidney's, Spencer's, Lodge's, Drayton's and the like. But the spelling is much as it happens, now ancient, now modern, and the punctuation is something unspeakable. No one seems to have gone to the trouble of identifying Constable's contributions to the "Diana"—at least there is no indication of them—or even of seeing that the syllabic *èd's* were uniformly marked. But, as tho in compensation of these shortcomings, Mr. Lee has furnished an introduction of considerable importance and interest.

Everybody knows in a general way that the fashion of the Elizabethan sonnet is derivative; it originated in Italy, to all intents and purposes with Petrarch, and was later adopted into France by a little group of writers called the *Pléiade*. Mr. Lee, however, wishes to show more exactly that the English variety is not merely inspired by the foreign, but is actually imitated or even literally copied, sometimes line for line, from the French. As to the main conclusion, he succeeds on the whole in making out his case. It is impossible to doubt, after a consideration of his evidence and a comparison of his quotations, that the Elizabethan sonnet is an adaptation of an adaptation—a thing at second or third hand. Not only is the idea of the art itself, but the details of its execution, its motives, imagery, conceits, are lifted bodily from Ronsard and Desportes and other Frenchmen, with an occasional look askance at the Italians. And with this judgment the internal evidence furnished by the sonnets themselves agrees. They bear many of the marks of a clumsy translation of an unfamiliar stuff. They are awkward, stiff, roundabout, lifeless, and sometimes well nigh unintelligible without reference to the original. They are, in short, a convention endlessly repeated, endlessly attenuated.

But in his pursuit of his main thesis there is a point or two which Mr. Lee has overlooked. To the esthetic aspect of the phenomenon he is rather blind. He neglects, for instance, to give Spenser's "Amoretti" due credit for their craftsmanship, for their advanced understanding of the technical and musical elements of verse. And he does not notice either that the Elizabethans, for all their subserviency, succeeded in modifying their models in such a manner as to give an entirely different effect to the thought, and in getting a little something of themselves into their work in spite of conventionality and tradition. So Sidney is always Sidney and not to be confounded with Daniel, Spenser, or Lodge. In other words, there is something there besides the conventions, and it is this precious personal flavor which Mr. Lee misses—possibly because he declines to take the proper attitude toward the product. He fails to observe that these sonneteers were trying to produce the very thing he scolds them for producing—an "intellectual" poetry, like that of Donne and Cowley, of whom they were in reality the predecessors. And in this way he

* ELIZABETHAN SONNETS. *With an Introduction by Sidney Lee.* 2 vols. New York: E. P. Dutton & Co. $2.50.

loses one of the most significant historical relations of his subject, and having no particular relish for the dainty himself, leaves its appreciation, as appreciation, just about where he found it.

Vergilius

THE scene of this story * is laid first at Rome, later at Jerusalem, and the curtain falls in the last chapter before the star haloed manger at Bethlehem, while all the angels in heaven sing with orchestral effect of the new born King of the Jews. A more fortunate selection of an historical situation could scarcely have been made. Rome was dying of wantonness; her splendor was only exceeded by her poverty and degradation. The patricians, from which class the author selects the hero and heroine, had perfected their type in an unexampled refinement of vice and cruelty,—and, giving curious significance to the whole, Augustus Cæsar and Herod the Great stared at one another from the two wings of the world, while Mary the Mother of Jesus hid with her precious burden in the manger at Bethlehem.

With these dramatic advantages, and "the fullness of time" in his favor, Mr. Bacheller should have written a greater book than "Quo Vadis." As a matter of fact, he has by no means equaled his former successes. There is a distinction which few novelists recognize between writing about the past and making the past speak for herself. Her ghosts are laid "in the dust of centuries dark and deep." And either the modern mind has developed out of psychic sympathy with the cruel, heroic temperament characteristic of the pagans, or we have lost the sense of its reality. For, only at rare intervals, when some man is born among us with a laurel-crowned, goat-legged genius, like that of Prof. Charles Kelsy Gaines, do we get a vital interpretation of pagan life. As such *Vergilius** is a failure,—the more noticeable because the author has selected the climax of the whole era, an event made potential through prophesies, and startlingly confirmed by history, and he has reduced it to a sort of Germanic idea, sensuously illustrated, but never effectively demonstrated.

The author has not made convincing his thesis that human love is the doorway for divine love, as illustrated by the characters he chose. Arria was not a woman to excite a pure love. She was sensual, and deliberately so. She had not a single quality which her lover found in her. And her lover would not have found them but for the fact that he was forced to by the author. Arria's mother was bad and the daughter had the same instincts highly developed, or she would not have danced before men in the thin tunic. She planned elaborately on every occasion to appeal to the beast in her lover. That is why it is an artistic sacrilege for Bacheller to compare her to Mary the mother of Jesus.

The way Vergilius runs from the room with his hands before his face to escape the vision of the seductions of Salome is not dramatic, but ridiculous. And when he gets home, panting, breathless with his effort of moral resistance, he talks to his henchman, David, about it more like a Sunday School scholar than a Roman pagan. The character sketch of Herod is not bad, but it is a pity to represent Augustus Cæsar as a sort of Sherlock Holmes. There are some good scenes and artistic touches in the book, but the numerous admirers of "Darrell of the Blessed Isles" will be disappointed in it.

* VERGILIUS. *By Irving Bacheller.* New York: Harper Bros. $1.50.

Poems of John Cleveland. Edited by John M. Berdan. New York: The Grafton Press. $1.50.

"This is John Cleveland, the famous Cantab scholar," so Carlyle sarcastically describes him; "Royalist Judge-Advocate and son of the Muses, who had gone through eleven editions in those times (of the Commonwealth and thereabouts), far transcending Milton and all mortals,—and does not need any twelfth edition, that we hear of." Modern scholarship, however, has a little altered Carlyle's slap-dash judgment; for "Cleveland," declares Mr. Courthope, "occupies a marked place in the history of English poetry," so that we may reckon ourselves fortunate after all to get this additional and something like a definitive edition of him. Dr. Berdan has worked conscientiously through all the preceding

editions from 1647 to 1699, rejecting those pieces whose authenticity is doubtful and making a fair test of the others; he has provided an introduction from an investigation of the materials for Cleveland's life, and he has furnished the satires and political poems with the necessary historical data, to say nothing of annotating the work generally. His introduction does, perhaps, show some lack of perspective from an exclusive prepossession with his subject, and he has retrenched a little radically, it may be, two or three things which we have become accustomed to regard as Cleveland's, such as "The Sad Suit in a Petitionary Poem by a Poor Scholar to his Patron," and "The Cavalier in Memory of his Old Suit." But from this sort of bias it is very difficult for an editor to free himself; while as for the evidence for and against the authenticity of this old and doubtful work, it is not always easy to agree upon it.

Portraits of the Sixties. By Justin McCarthy. New York: Harper & Brothers. $2.00.

The genial historian of the reign of Queen Anne and of the Four Georges is in many respects at his best in character sketches of his contemporaries. He has a genius for forming and retaining friendships, and, apart from that, is quick to give precedence to the attractive side of every personality he has met, sometimes to the extent of softening the tonic quality of criticism by a too kindly humor. He has often gone so far in this direction that the worth of his estimates has been impaired. It is hardly necessary to give instances; but the reader will very soon recognize the ground of our objection when he notes the large number of people who are described as among "the most attractive, forceful and brilliant personalities I have known." In this way Mr. McCarthy sometimes loses his critical faculty in his good nature; but we must confess we prefer this attitude in some respects to the mordant sarcasm which, even when it justly discounts a too generous estimate, leaves us with a despondent view of human nature. After all, is not Mr. McCarthy telling us about many of his early friends, and does not the reminiscent character of his book prepare us for a preponderance of the good things which were easier to remember? With this reservation it is less difficult to make allowance for what would otherwise be a serious fault. The "Portraits of the Sixties" are, of course, mostly those of the eminent English men and women whom the author began to know or to observe when he was a young journalist in London. It is easy to agree with him when he contends that no such brilliant galaxy of stars in statesmanship, literature, science or art has since appeared in Great Britain. Most of the characters described had given full proof of their powers in the sixties, tho some, such as Gladstone, Bright, Ruskin and Tennyson, were to accomplish an illustrious performance afterward. One of the most interesting features in the book is the contrast between men who represented a vanishing order and those who represented a new one; for example, the contrast between the career and work of Richard Owen, the last great champion of the "orthodox" school in science, and the incoming revolutionary personalities of Darwin, Spencer and Huxley. How interesting, too, to get a glimpse of Dickens and Carlyle when they were at the hight of their fame, a fresh, vitalizing influence that was felt then as it has not been felt since. It would be difficult to particularize in a list so long and varied. Mr. McCarthy seems to have known, seen or interviewed almost everybody who was worth seeing or knowing.

The Romance of Piscator. By H. W. Lanier New York: Henry Holt & Co. $1.25.

Mr. Henry Wysham Lanier has written a book full of the light, color and breath of the springtime, when a young man's fancy lightly turns to love and to —fishing. In this romance Piscator is lured hither and thither, led alternately by the song of the reel and the twang of the heart-string. Away down in Virginia a barefoot boy, who has been content to catch eels, mud-cats and minnows, sees an old black "uncle" yank up a fish longer than all the strings of finny fellows that he has ever hung to a hickory withe. The sight of that long fish made an ambitious angler of the boy. Years later, on a night by the Big Falls when the swamp sparrow fluted his reedy even-

song, when the moonlight lay on the stream and the salmon leaped to the gray hackle, Piscator saw from his boat the Peri in her boat, and again he had met his destiny. The Peri had a marvelous way of drifting from good waters to better streams, never leaving an address, nor so much as a bent twig to show the way her errant fancy or her "Angle-maniac" father's fishing fever had borne her. Following her to Mount Desert, Piscator had there a piece of fisherman's luck (who ever before heard of a stolen kiss called by that name?) which made the Peri shyer than before of leaving addresses or broken twigs. Yet Piscator, with never a clue, began a pursuit which led him to Bangor, to Montreal, back to Maine (paying double duty on his tinned woodcock, a peace-offering to the Peri), to Meddyhemps, to Pocomoonshine, to Tomah, to Paskahegon, to Lake Pequaunemenapsakasassanagnog. After a summer-long chase Piscator came upon her, the Peri, on the shores of Little Basin. Then follows a happy winter in the city, ending in a lovers' quarrel. Then the tables are turned. The Peri, who must yield the palm to Piscator as being the better fisher of the two, has proved herself the better hunter, for her first journey brought her into a stone's throw of Piscator's camp beside the fir-bordered streams of Newfoundland. Back to civilization and wedding bells.

Maria Edgeworth. By the Hon. Emily Lawless. [English Men of Letters.] New York: The Macmillan Co. 75 cents

It is impossible to say very much for this book of Miss Lawless'. To be sure, the subject is not a particularly good one; Maria Edgeworth has not very much life, after all, to write about, altho her story does not lack the interest of character altogether. She herself is a gentle, prepossessing apparition; her docility to her many successive stepmothers, her affection for her crowded family, her submissive regard for her father, make her a pleasant and tranquillizing object of contemplation. And him, in especial that oft married man, her father, patriarch and moral philosopher, author of seventeen children and a "Practical Education," innocently vain, naively self-satisfied, benevolently despotic—him Miss Lawless hits off very amusingly at the same time that she never ceases to relief and deplore his influence upon his clever daughter. It is a little difficult to understand the enthusiasm of "the Great Maria's thoroughgoing admirers, of whom the writer is evidently one. "The Absentee" is, indeed, a rather pretty, a rather "nice" little story; "Belinda," which Miss Lawless relatively underrates, and which is after all her chief, tho not her raciest, piece of fiction, has its points—as her biographer justly says, she is always sprightly. But she was on the whole so little of a constructive craftswoman, so little of an "artist," that even in "Castle Rackrent," which is in its kind an admirable entertainment, there is, in spite of the qualities, a constant sense of deficiency. And it must be confessed that this little mystery of cult does not become, as it should, much clearer for reading Miss Lawless. While of *Maria Edgeworth's* historico-literary significance, her affinities and affiliations, which it would be an interesting study to determine, there is little or nothing said which is satisfactory.

The Views About Hamlet and Other Essays By Albert H. Tolman Boston and New York: Houghton, Mifflin & Co. The Riverside Press $1.50.

The volume of Essays by Professor Tolman, of the University of Chicago, which Houghton, Mifflin and Co. have recently issued under the title *The Views of Hamlet and Other Essays*, brings together material already published in separate form—chiefly in periodicals—and may be taken to represent the whole of the author's mature literary output, except such as is of too fragmentary or severely technical a nature to be included. Its range of subjects is wide and interesting. Naturally there can be nothing fresh in a book consisting merely of reprints, and, indeed, a few of the Essays hardly escape the charge of triteness, if judged without reference to their own chronology. This is especially true of the discussion of The Style of Anglo-Saxon Poetry, altho it had, of course, a definite value seventeen years ago, when Anglo-Saxon scholars were far less numerous than now. Besides, the

wisdom of making the collection complete is obvious. Moreover, Mr. Tolman shows an unusual ability to present the problems of technical scholarship in a simple and popular way. Himself one of the most painstaking of students, he writes with the closest attention to the details of his matter and yet infuses into his style a lightness of touch and a suggestion of abandon that give the readers distinct esthetic gratification. This is most strongly felt in the earlier Studies in Macbeth and the essays entitled The Author's Comment in Vanity Fair, The Symbolic Value of English Sounds and Lanier's Science of English Verse. From the scholar's point of view the essay on Love's Labor Won is the most valuable of the group, being also the most recent. The fact that at the last it ventures no definite conclusion as to the identity of the much disputed Shakespearean play is a proof rather of the critic's caution than of his lack of personal conviction. The book is well worth reading for both matter and style, and will be found to be a convenient reference book for various literary question which it discusses.

Avril. By H. Belloc. New York: E. P. Dutton & Co. $2.00.

Under this pretty title Mr. Belloc has made a selection from six of the poets of the French renaissance—Charles of Orleans, Villon, Marot, Rensard, Du Bellay and Malherbe. Each writer is preceded by a short introduction on his genius and poetry, and each piece is provided with a few comments and an appropriate title in English. The little introductory essays are rather well done in their kind. They are light, with a lingering sort of touch, just a little whimsical, pervaded by a gentle melancholy, a tender regret for the fleetingness of time and the irrecoverable past. Perhaps, to venture an offhand criticism, they are rather too exclusively appreciative, as the phrase goes, to restore these old poets to their own according to the purpose avowed in the Dedication. But, then, in such a book as this, so attractive in itself and with the perfume of these delicate old flowers haunting between its leaves, the reader is loath to look for anything but an unalloyed pleasure.

Pebbles

"Homer, you know, represented some of the gods as fighting for the Greeks and some for the Trojans." "Yes. I guess that must have been the first allusion to the mills of the gods."—*Puck.*

....*Hicks:* "How do you happen to be going fishing on Friday? I thought you believed Friday was an unlucky day." *Wicks:* "Well, I always have. But it occurred to me this morning that perhaps it would be unlucky for the fish."—*Somerville Journal.*

...."Gentlemen of the jury," said an Arapahoe (Okla.) lawyer, "what kind of swearing has been done in this case? Here we have a physician, a man who from his high calling should scorn to tell an untruth. But what did he testify, gentlemen? I put the question before him plainly, 'Where was he stabbed?' Unblushingly, his features as cool and placid as marble, he replied that he was stabbed an inch and a half to the left of the medial line and an inch above the umbilicus. And yet, gentlemen, we have proved by three unimpeachable witnesses that he was stabbed just below the railroad station."—*Law Journal.*

....The Curse of Money.—Patrick A. Collins, Mayor of Boston, tells a story of a negro who was arrested for stealing. He had been caught helping himself to the contents of the cash drawer in the store of a Mr. Appleton. The magistrate before whom the negro was brought knew him, and was much surprised to learn the charge against the prisoner. Looking at the negro earnestly, he said: "Sam, I'm sorry to see you here. Didn't you know that no good could come from stolen money? There's a curse on it." "Well, jedge," replied the prisoner, "I didn't know Mistah Appleton stole dat money. I couldn't tell dat by jest lookin' at it."—*Texas Siftings.*

....Practical Arithmetic.—A teacher in an uptown school received the following from a complaining parent a few days a go: "Sir—Will you please for the future give my boy sum eesier somes to do at nites. This is what he brought home to or three nites ago. If fore gallins of bere will fill thirty-to pint bottles, how many pint and half bottles will 9 gallins fill? Well, we tried, and could make nothing of it all all; and my boy cried and sed he wouldn't go back without doing it. So I had to go an' buy a 9 gallin keg of bere, which I could ill afford to do, and then we went and borrowed a lot of wine and brandy bottles, besides a few we had by us. Well, we emptied the keg into the bottles, and there wer 19 and my boy put that down for and answer. I don't know whether it is rite or not as we spilt some in doing it. P. S.—Please let the next one be in water, as I am not able to buy any more bere."—*Topeka Herald.*

Editorials

A World's Political Union

It must not be disregarded, slighted, disdained, as a matter of no consequence, the action of the Interparliamentary Union, in its conference in St. Louis last week, when it voted to ask President Roosevelt to invite all the nations of the earth to an International Conference which shall inaugurate an International Congress of the world. It is a great idea and it will not blow away in smoke.

Our readers know—for we have been greatly interested in the matter—what a great part the United States had in the conclusions of the Conference of The Hague, summoned by the young Czar of Russia. The greatest work of that Conference was the establishment of the Court of The Hague, a permanent international tribunal, to which the nations can go, and have begun to go, to settle their disputes. It was the first step for the establishment of one united government for the world, which would put an end to war. It supplied the judicial department for such a world's government. It was no part of the plan of the Conference. It was a vigorous committee of the New York State Bar Association that drew up the plan for an international court, which, with amendments, our delegates pressed at the Conference and which was finally adopted, almost against the will of the delegates themselves, who regarded it as a mere counsel of perfection. But our Government has made it a great power, the chief event of these last years.

Now we must go further, and this the Interparliamentary Union proposes. This is its proposal:

"The Conference requests the several Governments of the world to send representatives to an International Conference to be held at a time and place to be agreed upon by them, for the purpose of considering:

"1. The questions for the consideration of which the Conference at The Hague expressed the wish that a future Conference be called;

"2. The negotiation of arbitration treaties between the nations represented at the Conference to be convened;

"3. The advisability of establishing an International Congress to convene periodically for the discussion of international questions.

"And this Conference respectfully and cordially requests the President of the United States to invite all the nations to send representatives to such a Congress."

This proposal looks much further than did the Conference of The Hague. It continues the work of that Conference on questions which have to do with the conduct of war, and it then proceeds to prevent war, in two ways. The first is by treaties of arbitration. It would give the delegates to the Conference power to draw up such treaties. Thus it would be the duty of all the delegates to prepare one great arbitration treaty among themselves to which all the nations would be parties, and then it would make it the duty of the United States, for example, to formulate separate treaties of arbitration, of a fuller scope, perhaps, with all other nations. This would go far to make war difficult or impossible, and would relieve the nations of the military burdens that rest upon them.

The other proposal is more novel, and more radical, but not new to our readers, for it is what Mr. Hayne Davis has urged in our columns and we have advocated. It is the establishing of a permanent International Congress, permanent as is the Court of The Hague, but devoted to the legislative department of international union, as that is to its judicial functions. Can that be achieved?

Why not? Government consists of three parts, judicial, legislative, executive—in our national Government the Supreme Court, Congress and the President. For the union of nations we already have the judicial in the Court of The Hague; next ought to come the legislative, and the International Conference, if called, is asked to consider the advisability of establishing such an International Congress, to meet periodically and vote what the nations ought to do. Their conclusions, if not law, will have the moral force of law and will harden into law. There will remain only the executive function, and possibly that will be accomplished by the world's public opinion; but we will wait to see.

Most earnestly we trust this Parlia-

ment of the World will be established. It is a great idea. We are glad it has taken form in the United States. We are glad that the duty of summoning the Conference which will consider this subject comes to our own President. It gives us again a most fruitful initiative. The Roosevelt Era, following the Victoria Era, promises to be notable in the history of the world.

The Real Questions

THE real questions do not figure largely in this Presidential campaign. They never do figure largely in a political campaign, except when some serious danger is threatened, or some great hardship is felt by a large part of the population.

A long period of administrative corruption or negligence, like that which culminated in the Star Route scandals, provokes an opposition party to put forth its most strenuous exertions, and sends independent voters in great numbers from the party in power; as happened when Samuel J. Tilden was nominated. A conspicuous difference in the personality of the candidates, appealing to widely unlike minds, as happened when Grover Cleveland ran against James G. Blaine, may incidentally provoke discussion of fundamental theories of policy. The great issue of financial integrity may bring on an active campaign, as when Mr. Bryan was first nominated and the Republicans seized the opportunity to declare unequivocally for a gold standard.

Had the question of territorial expansion been sprung upon the American people this present summer, when the question of the currency no longer troubles the business world, it would have precipitated one of the most exciting campaigns in our political history, but it is no longer a policy to get excited over. The real discussion of it was going on at a time when it could not be made the fundamental issue of a campaign, because the previous question, in the minds of the business population, was that of saving the country from silver inflation. There cannot be a real contest over the tariff at the present time, because neither party can deal with that interest in any thorough-going fashion. In short, the public mind has for many years been much wrought up over all of these great concerns, but it has not come to final decisions upon any of them except the currency. Upon the future of the Philippine Islands, and upon the tariff, it prefers to await the outcome of tendencies rather than to shape them. Such corruption and negligence as from time to time are revealed in administration do not at present provoke any organized effort toward reform.

There are real questions, other than those that have been named, that are confronting the American people, but the time to force a great fight over them has not arrived. The public is interested in them, it is studying them, it is slowly making up its mind upon them. One of these days there will be a great contest over them, as there was over the currency, and in an earlier time there was over the issues of slavery and secession; but when the contest will come no one is wise enough to foretell.

All of these questions center about the fundamental one: Are we henceforth to be a government of the people, for and by the people, or a government by the rich and powerful for the benefit of privileged classes? These questions were raised by the radical elements of the Democratic party when Mr. Bryan was first nominated. The platform was a misdirected protest against the money power.

The real questions will be brought forward by the people when they begin to ask themselves whether it is possible to maintain a government republican in fact as in name under enormous corporate organizations of increasing power. Is it possible to permit the means of transportation and all the natural resources of a continent to be owned and controlled by a few hundred corporations capitalized at hundreds of millions of dollars each, without submitting to a government practically created and controlled by these corporate interests? Is political sovereignty to reside in the people of the United States or is it to be an attribute of corporate wealth?

Neither party will raise these questions in the present political campaign. Both parties will keep on "safe ground."

There will be plenty of oratory, plenty of parading, plenty of spectacular color, plenty of personal banter and abuse, but there will be no serious contest over any vital matter. Meanwhile, however, let us hope that the people will keep on thinking about concerns that the politicians dare not touch. The real campaign of education will go on quietly, and one of these days the people will decide whether they will continue to rule themselves or will submit to the rule of the master captains of industry and wealth.

A Chief Issue in the East

THE dramatic events of war often blind onlooking peoples to the chief issues involved. Sympathies and prejudices are usually determined by self-interest, even when it is instinctively rather than rationally apprehended. Attitude once determined, without the help of much cool thinking, a purely intellectual interest in the causes and probable outcome of the struggle is not easily awakened.

Nevertheless, events of importance may turn upon the interpretation that onlooking peoples place upon any given contest between great nations. It becomes a factor in shaping sympathies and prejudices at some later time. The larger the number of the individuals, here and there, that patiently study the underlying causes and conditions of a great war, the greater is the probability that subsequent international difficulties may be adjusted without bloodshed.

For this reason we believe that the real issues at stake in the gigantic struggle now under way in Eastern Asia cannot be too often or too clearly set forth. There is still an immense amount of popular misinformation and misunderstanding on this subject.

Stated in a word, the conflict now raging is, in large part, a contest for the establishment throughout half the known world, and for generations to come, of one or the other of two opposite and irreconcilable policies of economic opportunity.

Relatively speaking, Russia and Japan are both poor countries, as national wealth is counted to-day. In each a large majority of the population subsists by agriculture, and ancient hand industries of the household or the small shop. Until a few years ago it was still possible for hand industry in the East to maintain itself in competition with a still imperfect machine production of the West. The gigantic strides that machine production has made within a generation have brought the entire East face to face with the necessity of entering upon some new phase of economic evolution. Russia and Japan both know that in one way or another they must vastly increase their wealth if they are to maintain their rank in the family of nations.

Russia, altho classed as a Western nation, is still in some respects a survival of bygone ideas and habits. Her scheme of government is a perpetuation of that Oriental despotism that may have been good enough for Assyria and Persia three thousand years ago, but is out of place in the modern world. Her ideas of economic policy are those of the dark ages, when it was supposed that the only way in which one community could get richer than another was by forcibly asserting an exclusive right over certain trading opportunities. Russia, therefore, is attempting by territorial aggrandizement to extend her political sovereignty over as large a part of Asia as possible, for the purpose of excluding therefrom the traders and the industrial enterpreneurs of all other nations. This medieval policy she has attempted to carry out by bluff and perfidy. Her promises to Europe, to Japan and to the United States, to retire from Manchuria, and to accede in good faith to the American demand for the open door in all trade relations, were made in deliberate intention and expectation of breaking them. It never entered her tenth century head that despised Japan would resent her perfidy and call her bluff.

Japan, an island Empire, feeling seriously the pressure of over-population, and long since committed to a thoroughgoing modern policy in government and education, aspires to be and expects to be the England of the East. Her conception of the way to broaden economic opportunity is precisely that which Eng-

land adopted a century ago. She demands to trade on equal terms with every part of the world. Above all, her natural markets of Manchuria and Korea she does not propose to be excluded from, but neither does she propose to exclude any other nation from them. She demands also a recognition from the world of the right of her population to emigrate to other lands. She has rationally examined the proposition of territorial expansion and has turned it down as incongruous with her real ambitions. Commercial, not territorial, expansion is her chief object. The scare idea that France and Germany have tried to work off upon the United States, that Japan, puffed up with conceit by her humiliation of Russia, will attempt to seize the Philippine Islands, can frighten only those that are very ignorant of the real mind of the Japanese. Even toward Russia Japan will show a consistent and enlightened reasonableness. When Russia is prepared to enter the contest for commercial advantage on fair terms with other nations Japan will permit her to occupy trading ports not only on the Manchurian but even on the Chinese coasts.

This, then, is the issue: On the one side a dark age policy of territorial aggrandizement for purposes of exclusive trade: on the other a modern policy of commercial expansion and a throwing open of all the Eastern world on equal terms to all competitors. Happily the heaviest battalions are again, as throughout the past history of the world they have been, on the side of enlightenment and progress.

The Pneumonia Investigation

Those who are accustomed facilely to explain the origin of pneumonia by ascribing it to the catching of cold will doubtless be not a little surprised to hear that since last winter the pneumonia death rate in New York has continued to be so high and the disease so much more frequent than in other years that the Commissioner of Health of New York City has asked for and been granted an additional appropriation of $10,000 for the investigation of the method of distribution of pneumonia, in order, if possible, to bring about its diminution in frequency and virulence. Of course, this is not the first time that it has become very clear that cold has very little to do with pneumonia. It has long been recognized that the disease was most prevalent not during the very cold weather in the depth of winter, but during the fall, and especially in the springtime, after winter had lessened the resistive vitality. Investigations in geographical pathology have shown pneumonia to be much more prevalent in the temperature and even in the torrid zone than it is in the colder regions of the North.

It has been known now for many years that penumonia is due to a special form of microbe, which exists so commonly in the mouth even of healthy individuals as to be considered almost a normal inhabitant of the upper part of the digestive tract. It is partly because of its presence that the saliva of human beings is likely to be fatal to animals when injected subcutaneously, because it is a special property of the germ of pneumonia, the pneumococcus, as it is called, to produce pus whenever it gains an entrance directly into the tissues. It does not produce a purulent inflammation in pneumonia, because it lies on the mucous membrane of the lungs, but does not gain an entrance into the tissues. It finds its way occasionally into the blood, but does not produce a very serious result here, unless the patient is very much run down.

It is rather easy to understand then that the problem of the method by which pneumonia is contracted is very difficult. It is not the presence of the pneumococcus alone that produces the disease, but a certain predisposition on the part of the individual followed by deposition of this germ on a mucous membrane, where it finds a resting place and can grow and multiply luxuriantly. Notwithstanding this it has been known for some time that pneumonia is to a limited extent at least a contagious disease. Among children certain forms of pneumonia spread very markedly among little hospital patients. In wards where adults are confined it is not unusual to have several cases of pneumonia succeed one another, sometimes after the admission of a case of the disease, just as if it spread from

bed to bed. This has been noted often among soldiers in barracks and in crowded quarters in old hospitals.

The present sensational announcements with regard to pneumonia need not produce any terrifying effect, since the disease has always been with us, but is now for some temporary reasons especially virulent. Its prevalence indicates the necessity for care in avoiding mingling with crowds at moments when extremely tired or when for some reason food has not been taken for a longer interval than usual. It is at moments like these that the disease is acquired, tho its method of distribution is not as yet definitely known. In the meantime it is to be hoped that the investigation now entered upon may prove fruitful in the suggestion of repressive measures for the disease, which has replaced tuberculosis, in Professor Osler's expressive words, as the captain of the men of death and has caused in the last few months many more deaths than those from the "Slocum" disaster.

Farmers' New Problems

PERMANENT revolutions are slow evolutions. In no direction has there been such a change in method and in purpose as in agriculture. Tools were transformed half a century ago. The steel plow was followed by reapers and harvesters that did the work of ten men, in one-tenth the time. These changes aroused the ambition of the farmer, and for a time created a great boom in the price of farm land. But there were problems still to be solved. In the first place, insect and fungoid pests were greatly on the increase. A few of these proved to be only temporary, and passed on for other realms to conquer. Not so with the codlin moth in our orchards, the curculio in our small fruit gardens, the potato beetle in our vegetable fields, and the anthracnose in our vineyards. Evidently there was a marshaling up of the forces of nature to test our ability to hold our own. The discovery of oil wells came just in time. Petroleum was the great insecticide and fungicide that man needed. Whoever made the first gallon of kerosene emulsion, whether Riley or Cook, was worthy to be classed among the world's great benefactors. The use of arsenical mixtures to be sprayed over our trees came next; and soon after the application of copper mixtures. "Spraying" has now become a distinct department in agriculture and horticulture—a science and art combined. With pump and nozzle the pomologist defies any insect or any minute vegetable enemy that may attack his crops. The codlin moth is held in control, and even the San José scale is at last routed by the sulphur salt and lime mixture. It gives us a sense of lordship that had almost passed away from the agriculturist of forty years ago. We are able once more to make sure of our smooth Spitzenbergs, and unblighted Bartletts. It demands a new race of farmers, however, an up to date, thoroughly educated, and scientific class of men—with energy and grit well worked in.

"Cover-crops" is almost a new word even among farmers themselves. The slow fellow has not yet found out what the word means. The earlier tillers of American soil used up what nature gave them, and then moved on into new fields. The old, wornout soils of New England and Virginia were left to recover strength as they could. But population increased, and the move westward had a back-set to the East. It was necessary to discover some method for renovating old farms. The problem was solved by cover-cropping. This means that certain clovers and leguminous plants could be sown after cropping a field, and that these would serve as mulch for trees and soil through the winter, and in the spring, by plowing under, would add largely to the nitrogen of the soil as well as the humus. On the roots of clovers and legumes are tiny bulblets, the use of which has only recently become known. These are found to be nitrogen-gatherers —the combined result of bacteria and plant growth. It is a marvelous provision of nature, which she revealed to us just when we stood most in need of the knowledge. Plowed under, they enrich the soil. They are called "cover-crops," because used to cover and protect the roots of orchard trees through

the winter. He will be a poor farmer, indeed, who, five years from now, does not know the principle of cover-cropping and does not make use of it to feed his apple trees, while it protects them against severity of climate. He will plow his orchard and take off a summer crop, and in August or September sow his cover-crop.

The influence of bacteria, for a long time supposed to be only injurious, has been found to be of the utmost importance in the renovation of old soils, or the adjustment of soils for special crops. The Government sends out yeast ferments to the farmer, in form of dry cakes. The cake as received contains millions of dried germs. The farmer drops it into a barrel of clean water, and the revived germs soon turn the water to a milky white. Clover seed, peas, or any other leguminous plant seed becomes endowed with marvelous strength after it has been immersed in this inoculating liquid. So now it is coming about that the commonest farmer talks of inoculating soil, as he would of plowing it. It is becoming one of the everyday applications of science to land tillage.

When steam took the manufacturing element away from farming, it left farm life exceedingly dull. It is no wonder that the farmer became somewhat decadent in his spirit, and deserted farms were regularly bulletined by some of the States. It was necessary to change farm methods, and infuse them with a new spirit. Possibly the establishment of Experimental Stations had a good deal to do with it, but very rapidly we are finding the experimental spirit in common everyday farm practice. "Plant breeding" is the term which has dropped into usage, to cover what might as well be called plant-creation. New plants and new fruits are created by crossing or hybridizing older sorts. At the present rate of progress, it will be hard to find a farmer, ten years from to-day, who will not devote a part of his time and land to experiments. We will have new vegetables, new fruits and new flowers—the result of his own scientific selection and breeding. The principle of sex is universal in nature. Taking advantage of this, the pomologist removes the pollen from a flower, which shall be one parent of his new product, and in its place dusts the pollen from another variety. This pollen passes down the pistil and fertilizes the ovary. The seed produced will have the qualities of both parents, but every seed in different ratio. These seeds, when planted, develop into new vines, trees, or shrubs, with new qualities. In this way our list of plums, cherries, pears, apples and garden vegetables is being rapidly enriched.

Is it any wonder that with these new factors entering into farm life the great farm of hundreds of acres has been subdivided into small holdings? Intensive farming has displaced extensive, because the farmer, by scientific work, finds that he can grow more crops, make more money, better feed and clothe himself, from ten acres than from ten times ten. This natural subdivision of land meets the need of a rapidly growing population. It has been said that twenty millions of farmers are compelled to feed eighty millions of people. It will hereafter be said that two-thirds of the people can feed themselves with the produce of their own gardens and orchards. Can it surprise us that farming is also becoming the most wide-awake, interesting and attractive of all the industries? The tide countryward increases, because of this cheerful outlook. Of the increase of population about seventy per cent. is now locating on the land.

Kipling's "They" Once More

We have readers who greatly like Kipling's "They" in *Scribner's* and who also are pleased with our editorial about it last week, but who yet tell us they cannot exactly see what the story all means. How should they? They are "blindies;" they "cannot see;" they must have "lost," they must have had occasion to "walk in the wood," before they can see. And they ask us what this and that means. Why should we tell them? We will only ask them some questions. But let them not expect that in a spirit-parable of this sort, with earth so close bordering, every item shall have an interpretation. You are forced to mix coarse, literal, meaningless things of this world with the spiritual in-

visibilities and realities. Against this bourne of time and place there will be some clashing. You cannot interpret a meaning into the ass on which the good Samaritan of the parable put the man that had fallen among thieves, but the ass was necessary to carry the poor fellow—and the lesson. Do our inquirers remember when Mr. Kipling was deadly sick in New York City, and that very time his beloved little daughter was taken ill and died, and he could not know of her illness, and his dearest little Josephine—was it not Josephine?—had to be buried from a strange home without father or mother to see her die or follow her to her grave? And out of the common, daily scenes of life and home may not a parent's loss suddenly take one into the mystic forest and the fair house, such as never was on county map or register, field and mansion past beautiful, where are many children's rooms, to which they may be called by day or night, to warm their cold toes by a hearth fire that never goes out, cared for by a loving, longing guardian spirit, whose own home it is, but who here never knew a mother's pang and loss, even, as they tell us, angel holiness can never feel the grateful rapture of forgiven sin? And is it not right and well that one who has lost should once, or twice, or thrice follow the elusive child-spirit into the shadow and the wood, and stay there long enough to catch the fleeting vision, and feel the signal of recognition, the old so familiar "kiss in the palm of the hand," and then go sternly back to the journey of the dusty road? And is it true, or may it b , that a sensitive spirit-soul can see the very atmosphere of thought and feeling which surrounds each one of us, and whose oval, tenuous aura, undiscovered to others, flashes to the adept eye with the harsh or gentle colors of every passion? May there be those initiate who can see the Egg Itself? But who can enter the wood and who can see the flitting figures if they have "neither borne nor lost"?

Bloch's Theory

It was the theory of Bloch, the banker whose book so influenced the Russian Czar, that the weapons of war have become so deadly that armies cannot stand against them; that war, in perfecting itself, has destroyed itself. The present Eastern war does not quite bear out this notion. Machine guns and mines have been destructive enough, but human will and patriotism have proved a full match for death in its most deadly forms. Death seems to have no terrors to Japanese or Russians. It is the old lesson, that give us soldierly courage, whether you call it stolidity or obedience or fate or love of country, and men will pour out their lives regardless of the surest danger. In what war have there not been abundant volunteers for forlorn hopes? Men cannot be frightened out of war; moral forces must prevent it, and substitutes for fighting must be found between nations as between individuals. Will, then, the combatants in the present war not soon be exhausted? We do not see that they will. Russia will be very slow to yield to a decisive defeat, and her armies can be recruited indefinitely, if she can find the money and there are no uprisings at home. And Japan will not be soon exhausted. The population of Japan is about 47,000,000, and that of Formosa will bring it up to about 50,000,000. In one year in Japan there were over half a million marriages—that is, nearly half a million boys came to man's estate; there are, and will be for twenty years, half a million new recruits for the army. These are enough, as many as Russia, with her most difficult means of access, can throw into the seat of war. If Japan can continue to find the sinews of war, there will be no difficulty about the food for powder.

The Royal Baby Boys

The Royal mothers have greatly pleased their people in these last few weeks in giving a male heir to their husbands' thrones. To have a boy baby born was thought in Russia bigger than a battle; and an heir to the throne in Italy is thought to have saved the dynasty, while the name given to him, Prince of Piedmont, is a political event that may make peace with the Vatican. Yet let us look forward for twenty years—are either of them fairly sure to find a throne saved for him to sit on? Italy is moving very fast toward a republic. Switzerland and France are both republics, and Spain

is likely to be one at any revolution. The common people in Italy, the workmen, the Socialists, are mainly republican in sentiment. It would be a rash prophecy that the republic will be delayed twenty years. In Russia it is no peaceful revolution, but a cataclysm that threatens the throne of the Czar. A year's misfortunes in the war with Japan, an unwillingness to serve in the army, a bad harvest, poor business, taxes and starvation may come at any time, and then, where would be the boy?

"Ask of the winds that far around
With fragments strewed the sea."

It is no happy fate reserved for the baby heir of a tottering throne.

Forerunner and Apostle

The assumption by John Alexander Dowie of the title of First Apostle of the Christian Catholic Church, following his claim to be the new Elijah, Forerunner of our Lord, indicates the self-deception that goes with inordinate conceit. Now that he has passed from Forerunner to First Apostle there seems to be nothing left, unless it be that he shall conclude that he has become the very incarnation of the promised return of Christ. It was said of a certain distinguished teacher of teachers no longer living that he declined a very honorable post because he was waiting for a vacancy in the Trinity. What new vacancy Dr. Dowie is waiting for is not clear; none seems too high for him to aspire to. We greatly regret this last obsession, because it indicates that it will not long be possible for him to hold together his following, and we greatly desire that his religio-sociological experiment may long give us the example of a considerable city ruled under laws of the strictest morality strictly obeyed. His Zion has its good side, and he rules like an autocrat with full consent of the governed. The failure of his great experiment is likely to come out of his overtopping conceit, which approaches insanity.

French Tyranny

Pius IX was wise in his attempt to convert the French Catholics to the support of the Republic, but he failed; now the Catholic Church has to reap the consequences of its folly. Because the authorities of the Church were teaching disloyalty the Government has taken the most drastic measures. First, a law was enacted that no congregation should teach without a special authorization. Next, it generally refused them authorization, and broke up and expelled many of them. M. Combes had applications from 12,800 houses, and nearly the whole of them have been refused. Now a new law absolutely forbids every grade of teaching to the congregations, a period of ten years being allowed during which the few which are still allowed to teach may prepare to disband. Meanwhile they can take no novitiates. By October 1st 751 boys' schools conducted by the Christian Fathers, and 1,054 girls' schools, and 593 orphanage schools will be closed, and the children expected or required to attend the public schools. There will be left 1,862 schools, which will be closed later, probably far within the ten years, unless there is a change of sentiment in the corps legislatif and the Government. It is hard for us to understand such tyranny. We let the Christian Brothers teach all they will, or any other order of monks or nuns. We do not feel assured that it is best for a country that its youth should all have one sort of education. Above all, we believe in liberty. What we would say and do if there were in this country a strong federation of schools teaching that our Government is a convenant with death and an agreement with Hell is another matter. Possibly we should be seduced into forgetting our boasted worship of liberty and should think that the preservation of public order is Heaven's first law.

Devolution

To our ear *devolution* is no sweeter a word than *home rule,* but it sounds very different to the British Conservatives, even tho it moves to the same result. So it is that the Irish Reform Association, composed mainly of Unionists, has declared for a measure of administrative local government for Ireland. They call it *devolution,* as it would *devolve* on county authorities a part of the legislation that must now be attended to in the Imperial Parliament. But it is plain that the demand for devo

lution will not be confined to Ireland. Already Lord Hugh Cecil wants it in England. The Welsh people are a close unit, and are now holding as close together in Parliament, under the lead of Mr. Lloyd-George, as do the Irish members. They are ready for local control of local affairs. Also in Scotland the late ecclesiastical crisis, due to the absurd action of the House of Lords, has stirred up the people for some sort of autonomy, and the movement is likely to be a strong one. Why should not England follow? Let us have devolution all around, supported by all political parties. A chief reason why the late session of Parliament has been such a fiasco is because it has so much local business to do that it cannot find time to attend to Imperial matters. If there could be four local Parliaments the cry for home rule in Ireland would lose all its terrors. The Irish Parliament would be no more a mark of disunion than is the New York Legislature a rival to our Congress. We believe the question is likely soon to be one of practical statesmanship, as it will give peace to Ireland and allow Irishmen the world over to have a loyal feeling to the Government of their native land.

Bishop Brent's Proposed Petition

In an interesting communication by Bishop Brent, of the American Episcopal Church in the Philippines, he reckons the Independent Catholic Church in the Philippines, under Archbishop Agilpay, as having a following of about three million people, a million less than it was a year ago. He says it has shown more cohesion than he expected, but he expects, under the attacks of the American bishops who have gone to the Philippines, a considerable further loss, the origin of the movement being so largely political. As to the morals of the Filipino clergy, Roman or Independent, he finds conditions worse than he had expected, and he makes the very strange suggestion that "the chief Councils of our own Church, the Church of England, and the Old Catholic Church," or "all the Christian bodies in America," should, for the sake of good morals, unite in a common voice of petition to the ecclesiastical authorities at Rome, asking them "to relax the rule of a celibate clergy locally," in the Philippines, as also in Mexico, Central America, South America and the Azores, "wherever similar climatic and racial conditions obtain," and "to pronounce the Church's blessing on every priest who has been and is faithful to one woman, and to excommunicate *con amore* those who have various *queridas*." He would have this done to "show that to however great dimensions the principle of tolerance may grow in matters doctrinal, Christendom will not brook any trifling with elementary morals, not even for the sake, nor under the shelter of, an ecclesiastical ordinance of Rome." Whatever may be the evil, and it is certainly great, we have little expectation that any such petition of protest would be received or be of any use. Bishop Brent's testimony, with that of a famous Senate "Document 100," settles the facts, and already within the Catholic Church there are calls for a relaxation of the rule of celibacy, a rule which the Church which made it has the right to abrogate, as, indeed, it now allows exceptions.

World Socialism

Dr. Robert Michels, of Germany, has just compiled the total Socialist vote of the world. This differs in some respects from the same estimate published in the June number of *The International Socialist Review*. The editor of that paper therefore has published a corrected table in the light of all the information at hand, and altho there still may be errors in it, it is declared to be approximately correct. The statistics by nations are as follows:

GERMANY

	Vote	Reprs		Vote	Reprs
1867	30,000	8	1884	549,990	24
1871	101,000	2	1887	763,128	11
1874	351,952	9	1890	1,427,298	35
1877	493,288	12	1893	1,876,738	44
1878	437,158	9	1898	2,118,973	57

* In this year only one-half the deputies were elected, so this is not a true test of the Socialist strength.

It must be remembered, however, that the right of suffrage, the method of party alignment and the character of the Government all have influence on the number of votes cast, and the requirements for suffrage in the various countries are so diverse that these figures are of little value for comparison. The total growth of the Socialist vote in the world since 1867 is as follows:

1867	30,000	1891	1,799,060
1871	101,000	1892	1,798,391
1872	101,268	1893	2,585,898
1874	352,220	1894	2,914,506
1876	353,028	1895	3,033,718
1877	494,364	1896	3,056,873
1878	438,234	1897	3,896,602
1881	373,850	1898	4,515,591
1882	423,004	1899	4,534,591
1884	666,150	1900	4,874,740
1885	667,614	1901	4,912,740
1887	931,454	1902	5,253,054
1889	1,109,891	1903	6,285,374
1890	1,794,060		

There is no excuse at this day for any intelligent man not to know what Socialism is and proposes to do. Indeed, its stupendous growth since the publication of Marx's "Capital" is often compared with the rise and spread of Christianity. Where Socialism to-day is not an economic creed, it is a religion! To all those who want a fair statement of the significance of Socialism we commend John Graham Brooks's recent book, "Social Unrest."

The bill for the admission of Oklahoma and the Indian Territory as one State is giving concern to a number of the friends of temperance who have, under the Federal laws and Indian treaties, enjoyed the exclusion of alcoholic liquors for seventy years from the Indian Territory. The Statehood bill, which passed the House, but not the Senate, makes no provision for the maintenance of the rule under the treaties. It is not at all clear that it should, as that will be a matter for the State to decide, under the Constitution, and the treaties with Indians will cease to be operative under the allotment law and the breaking up of the tribes. But the people will have the matter in their own hands. They can at least secure from the first session of the State Legislature the adoption of a law for local option, which ought to shut out the saloons from the counties that will make the present Indian Territory, and from a good part of the present Oklahoma.

The Maine election gives little more comfort to the Democrats than did that in Vermont. Where they have succeeded locally it has been on the license issue, and they have defeated the Methodist minister who as sheriff closed saloons. Indeed, there is serious danger that the dissatisfaction in the Democratic ranks may make this a very uninteresting national campaign. Already it has been necessary to call in Senator Gorman to take charge of the campaign in the East in an "advisory" capacity. Judge Parker has been unable to put any spirit into the campaign, and numbers of the Democratic papers have complained that it is "slow." The *Boston Herald* says the management of the campaign is beneath contempt, and the New York *World* and *The Evening Post* are among

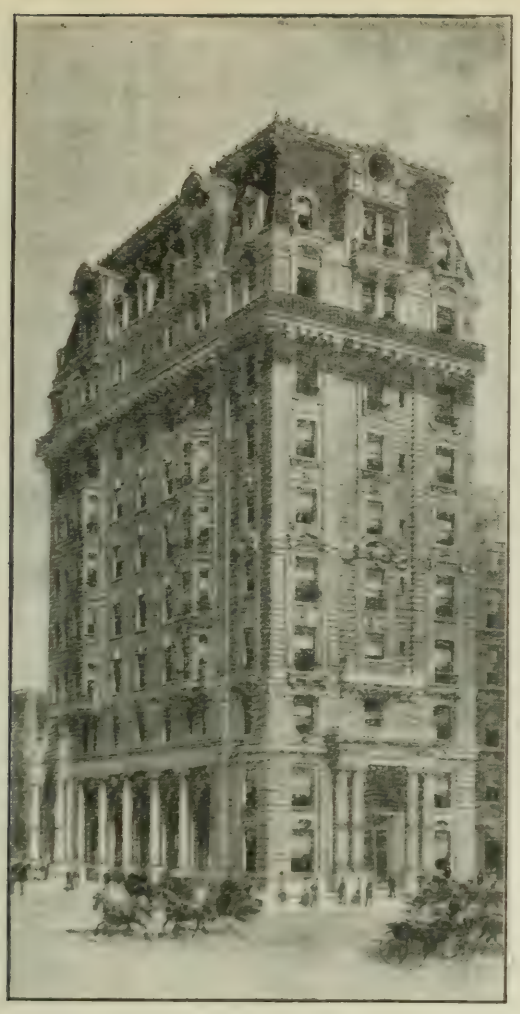
other papers that do not suppress their flings.

It has been settled by the House of Lords that the "dead hand" rules for as much as sixty years. The Free Church had no right to keep its property acquired under its faith when it was organized, and it has to be restored to those who hold fast to the old creed. In the case of a Church which changes its faith after how many years will its right to the property it has taken over and acquired be legitimated? We ask the question in view of the fact that there is no doubt that the Protestant Church of England changed its creed at the Reformation, and has ever since held immensely valuable cathedrals and churches built under its discarded faith. What would the House of Lords say if the case were presented to it?

That "educated horse," Hans, must be a wonder, if the commission that has been examining him has not been deceived. He has been trained, so the report tells us, to reason. He has some comprehension of handwriting, has musical and color discrimination and can add and subtract figures. They say there is no possibility of a trick, and that the methods of instruction that have developed this unusual ability have been rather pedagogical than that of the animal trainer. We do not yet know what might, in generations, be made out of our most intelligent animals, if the attempt were made really to develop their intelligence, instead of teaching them old tricks.

Who knows what is the capital of Australia? It is not yet in the geographies. It is a new town, built for the occasion, and named Dalgety, midway between Sydney and Melbourne. It is a place not even large enough to have had a postal delivery. Australia is doing what the United States did, make its own city. It is on the Snowy River, that flows down from the snows of Mount Kosciusko, the highest hills in Australia, and is 2,000 feet above sea level, which assures cool nights. It is inland, but within easy reach of the sea, in the far southeast corner of Australia.

This is just the time when the schools and colleges are opening, and we see in every daily paper a report of some one being injured or killed by being hazed or hurt in some class contest. One day's paper tells us of a freshman of Purdue University dangerously ill with pneumonia as a result of being thrown and kept in the cold river, and another likely to die at Wittenberg College from injuries received in a fierce class rush. We have heard of no arrests. The faculties are to blame as much as the students for such homicides.



Add to the mixed metaphors that are being quoted from the orators of Parliament this, which was got off the other day in a political address by the eloquent Alabaman, John H. Wallace, Jr., who told his hearers that under Judge Parker this Government "will be redolent with the cadences of prosperity." On the other hand, Roosevelt's "conceit is a colossal specimen of psychological architecture in an egostocracy." Did he mean egometocracy?

Both the military force which we hold in the Philippines and the constabulary force of the Civil Government are to be reduced. The four regiments of cavalry will be three, and the nine infantry regiments reduced to seven. Thus we are coming down there to the ordinary peace footing, and the people are satisfied. The complainants are here at home, and yet the party which criticises would make no change if it could be in power.

We cannot but be glad that Peary has found the means, in a vessel as well built and planned as that of Charles Bénard's, which we described last week, to make another attempt to reach the Pole. His will be a different route from that taken by Bénard, and it is to be fervently hoped that one of them will succeed in the quest.

What we do not quite understand is why the party which condemns the President for asking Booker T. Washington to stay to lunch should choose as the treasurer of its campaign fund a man who confesses no shame for sitting at dinner with the same man.

Financial

The Van Norden Trust Company's New Building

THE Van Norden Trust Company's new building is located at No. 787 Fifth Avenue, on the corner of Sixtieth Street. It is 125 feet by 50 feet, and contains eight housekeeping suites, each occupying an entire floor, in addition to the banking rooms. The district is distinctly residential, and is the abode of wealthy and fashionable people. The Metropolitan Club is near at hand, and many well-known hotels are neighboring features on the Plaza. Selected marbles have been freely used as hallway decorations and otherwise throughout the building.

The officers of the Van Norden Trust Company are: Warner M. Van Norden, President; Thomas P. Fowler, Vice-President; Arthur King Wood, Secretary and Treasurer; William W. Robinson and Ames Higgins, Assistant Secretaries; James B. Haig, Jr., Assistant Treasurer; Edward S. Avery, Trust Officer, and William F. Havemeyer, Chairman of Executive Committee. Its Directors are James Talcott, John Claflin, Henry F. Shoemaker, Ernst Thalmann, Charles W. Morse, Henry T. Bronson, William Nelson Cromwell, Henry Phipps, Seth M. Milliken, Warner Van Norden, Warner M. Van Norden, William F. Havemeyer, Richard L. Edwards, Jonathan B. Currey, Thomas P. Fowler, Mahlon D. Thatcher, Henry H. Cook and Arthur A. Fowler. Its capital is $1,000,000, its surplus is $1,000,000, undivided profits are $138,537, and the deposits at the time of the latest statement were $6,566,158. The company has an East Side Branch, of which Rudolf Metz is Manager.

THE Government's final report upon the condition of wheat indicates a crop of about 540,000,000 bushels.

....Senator Depew predicted, last week, that within ten years electric power would be substituted for steam on the great railways.

....It is asserted that more than one-third of the stock of the Pennsylvania Railroad Company is now owned in New York, owing to recent purchases by Rockefeller interests.

....The report of the Western Union Telegraph Company for the quarter ending September 30th, 1904, shows a surplus (with net revenue partly estimated) on that date of $15,466,859, or a gain of nearly $600,000 since July 1st. A dividend of one-quarter per cent. has been declared, payable October 15th.

....Through the instrumentality of August Belmont, four fully equipped subway trains of five cars each were placed at the disposal of the National Park Bank, of this city, on Thursday of last week. About 2,300 correspondents and friends of the bank were taken on a tour of inspection over the new underground road, between the City Hall and Ninety-sixth Street. Among the bank's guests were United States Treasurer Roberts, Assistant Secretary Armstrong and the presidents of several prominent banks in the West and South.

Insurance

Insurance in Bulgaria

According to a recent report by the French Consul at Burgas it is only during the last twenty years that insurance agencies have been established in this department. In the beginning only very moderate business was done by these agencies. Gradually, however, the natives became convinced of the beneficence of the insurance principle and of the benefits to be derived from insurance in practice. The majority of merchants now insure their premises and goods against fire. Life insurance has not yet become quite so popular in the department, the population of which is somewhat in excess of 300,000. An American company does most of the business. There is one French company and two native ones in the field. There are three marine insurance companies at Burgas, all of which are German.

The Fireman and His Ax

Certain complaints regarding the needless destruction of property by firemen have eminated from Chicago. It must be confessed that there seems far too much ground for such complaints, not only in the Windy City, but in New York as well. In getting at a fire the firemen frequently chop away doors, break large and costly plate glass windows, and do other damage that might with some care be largely diminished. Cornices, shutters and other parts of buildings suffer at times heavy damage at the hands of the firemen. As the destroyed property has to be paid for by interested insurance companies it would appear to their interest to see to it that the loss in this direction is as light as may be. It is not probable that Chicago firemen are greater offenders than are their brothers in other cities, but now and then any fireman with ax in hand seems to be carried away with the spirit of destruction. Proper discipline would largely curb if it could not eliminate such losses.

Charles Earle Johnson, of Hartford, Conn., has been appointed Professor of Insurance at Yale University. The study of insurance at Yale, to which reference was made in The Independent of July 7th, will be taken up this fall as a regular course in the college curriculum. It will be open to seniors and juniors. Attendance at the lectures and other exercises of the course is open to the public.

....The Catholic Knights of America are undergoing reorganization. Their experience is one more illustration of the fact that life insurance is a scientific proposition. Various assessment life insurance societies and organizations have set their faces against this fact and have attempted over and over again to combat it, but, alas, it will not down! The pocket surplus upon which the assessment societies frequently rely generally fails just when the moment becomes critical, and if there is no receivership there must be reorganization. Something like ten thousand old men—that is to say, men between 60 and 70—who were enrolled as members of the C. K. of A. have in the process of the reorganization been swept entirely out of the order. This has been accomplished by means of a decree calling for the future payment of $200 a year in the way of premiums to secure a $2,000 death benefit, instead of the vastly smaller sum hitherto collected. The history of the reorganization of the C. K. of A. is a sad story, but the future has similar stories that wait but a little while to be told of other organizations held together only by means of assessments.

....Coupons and dividends announced:

San Francisco and San Joaquin Vall. R.R., Coupon No. 16, payable October 1st.

Atch., Top & S. F. R'way, Gen Mort., No 18, payable October 1st.

Mergenthaler Linotype Co., quarterly, 2½ per cent., payable September 30th.

Otis Elevator Co., Preferred, $1.50 per share, payable October 15th.

United Fruit Co., 2 per cent., payable October 15th.

Chicago, Rock Isl. & Pacific R'way, 2½ per cent., payable October 1st.

Nat'l Sugar Ref. Co. of N. J., Preferred, 1¾ per cent., payable October 3d.

Am. Locomotive Co., Preferred, 1¾ per cent., payable October 21st.

Franklin Trust Co., 3 per cent., payable September 30th.

The Independent

Vol. LVII NEW YORK, THURSDAY, SEPTEMBER 29, 1904 No. 2913

Survey of the World

Judge Parker's Letter of Acceptance

Judge Parker begins his letter of acceptance by declaring his "unqualified belief in the gold standard." He then turns to the "issue oftentimes referred to as Constitutionalism vs. Imperialism." If we would retain our liberties, he says, we cannot permit or tolerate the arrogation of unconstitutional powers by the executive branch of the Government:

"The magnitude of the country and its diversity of interests and population would enable a determined, ambitious and able Executive, unmindful of Constitutional limitations and fired with the lust of power, to go far in the usurpation of authority and the aggrandizement of personal power before the situation could be fully appreciated or the people be aroused. The issue of Imperialism which has been thrust upon the country involves a decision whether the law of the land or the rule of individual caprice shall govern. The principle of Imperialism may give rise to brilliant, startling, dashing results, but the principle of Democracy holds in check the brilliant Executive and subjects him to the sober, conservative control of the people. The people of the United States stand at the parting of the ways."

The necessity for tariff reform, he says, was never greater than at the present time. Many of the Dingley duties are excessive, unjustly and oppressively burdening the people, and granting to domestic manufacturers, "singly or in combination, the privilege of exacting excessive prices at home and prices far above the level of sales regularly made by them abroad with profit, thus giving a bounty to foreigners at the expense of our own people." Some of these duties are "a direct incentive to the formation of huge industrial combinations," which are thus enabled to stifle domestic competition and practically to monopolize the home market. Some were imposed with the avowed purpose that they should furnish a basis for reduction by means of reciprocal treaties; but such treaties, negotiated by the Executive, have been defeated by the protected interests. "Our party appreciates that the long-continued policy of the country makes it necessary that tariff reform should be prudently and sagaciously undertaken, on scientific principles, to the end that there should not be an immediate revolution in existing conditions." Altho the Republicans are likely to control the Senate for four years to come, he believes that their party, which "includes many revisionists," will not defy the popular will "expressed peremptorily at the ballot box." The people demand reform. The cost of living has grievously increased. "Those having fixed incomes have suffered keenly; those living on wages, if there has been any increase, know that such increase has not kept pace with the advance in the cost of living, including rent and the necessaries of life." Referring to his remarks in his speech of acceptance about the common law as a remedy for Trusts, and evidently having in mind Mr. Roosevelt's comment, he says:

"Whether there is any common law which can be applied and enforced by the Federal courts cannot be determined by the President or by a candidate for the Presidency. The determination of this question was left by the people, in framing the Constitution, to the Judiciary and not to the Executive."

The Supreme Court recently held, he says, that common law principles could

be applied by Federal courts in cases involving Interstate Commerce in the absence of Federal statutes specifically covering the case. He then argues at length in support of commercial reciprocity, saying that outside markets must be found if we would run our mills to their full capacity, and that it is vital to the extension of their markets abroad that our manufacturers should secure their raw materials on the most favorable terms. Here he makes use of the last public address of Mr. McKinley, who, he says, "had come to realize that the 'stand pat' policy must give way:"

"The exorbitant duty imposed on many an imported article by the Dingley tariff was avowedly intended by its author not to be permanent, but to serve temporarily as a *maximum*, from which the Federal Government was empowered to offer a reduction in return for an equivalent concession on the part of a foreign country. President McKinley undertook honestly to carry out the purpose of the fourth section of the act. A number of reciprocity agreements were negotiated within the prescribed limit of two years, which, if ratified, would have had the twofold result of cheapening many imported products for American consumers and of opening and enlarging foreign markets to American producers. Not one of those agreements has met with the approval of the Republican masters of the Senate. Indeed they did not even permit their consideration. In view of the attitude of the present Executive, no new agreement under the general treaty power need be expected from him. Nor does the Republican platform contain a favorable reference to one of the suspended treaties. This section of the Dingley act stands forth as a monument of legislative cozenage and political bad faith."

By "self-government" for the Filipinos, he says, he did not mean less than independence. We should do for them "what we have already done for the Cubans":

"And I favor making the promise to them now that we shall take such action as soon as they are reasonably prepared for it. If independence such as the Cubans enjoy cannot be prudently granted to the Filipinos at this time, the promise that it shall come the moment they are capable of receiving it will tend to stimulate rather than hinder their development. And this should be done not only in justice to the Filipinos, but to preserve our own rights; for a free people cannot withhold freedom from another people and themselves remain free. The toleration of tyranny over others will soon breed contempt for freedom and self-government, and weaken our power of resistance to insidious usurpation of our Constitutional rights."

The building of the Panama Canal, he says, should be pressed to completion with all reasonable expedition; but he remarks that "the methods by which the Executive acquired the Panama route and rights are a source of regret to many":

"To them the statement that thereby a great public work was assured to the profit of our people is not a sufficient answer to the charge of violation of national good faith. They hold that adherence to principle, whether it works for our good or ill, will have a more beneficent influence on our future destiny than all our material upbuilding, and that we should ever remember that the idea of doing a wrong to a smaller, weaker nation that we, or even all mankind, may have a resultant good, is repugnant to the principles upon which our Government was founded."

The task of restoring the American merchant marine in the foreign trade can be wisely intrusted, he thinks, to the Democratic party, but the remedy "surely does not lie in the granting of subsidies." An investigation of every Government Department is needed, and will be made if the people elect a Democratic Congress and President. Promotions and appointments in the Army and the Navy have "frequently been based on favoritism instead of merit. Trials and court-martials have been set aside under circumstances indicating political interference." These abuses, he says, should be corrected. He argues at considerable length that usurpation of the power of Congress was "attempted" by Pension Order No. 78. Even if a Democratic President did something looking in the same direction, which he does not admit, the citation of one act of usurpation as an excuse for another must not be tolerated. The Democrats have been challenged, he asserts, to say whether they would revoke the Order if they should come into power:

"I accept the challenge and declare that if elected I will revoke that Order. But I go further and say that that being done, I will contribute my effort toward the enactment of a law to be passed by both houses of Congress

and approved by the Executive that will give an age pension without reference to disability."

In our foreign relations, Judge Parker says, we should adhere strictly to the traditional policy of the country, which means the cultivation of peace instead of the glorification of war, and the minding of our own business in lieu of spectacular intermeddling with the affairs of other nations:

"It means strict observance of the principles of international law and condemns the doctrine that a great State, by reason of its strength, may rightfully appropriate the sovereignty or territory of a small State on account of its weakness. It means for other American States that we claim no rights and will assume no functions save those of a friend and of an ally and defender as against European aggressions. It means that we repudiate the *rôle* of the American continental policeman; that we refuse to act as debt collector for foreign States or their citizens; that we respect the independent sovereignty of each American State and its right to preserve order and otherwise regulate its own internal affairs in its own way, and that any intervention in its affairs by us is limited to the single office of enabling its people to work out their own political and national destiny for themselves free from the coercion of any European State."

Much space is given in the letter to criticism of the recent large annual expenditures of the Government, which are compared with those of an earlier time. The recent increase, Judge Parker says, is "so great as to excite alarm in the breasts of all thoughtful men." It demands an official inquiry, especially in view of the postal frauds; but the Republicans would not permit one to be made. He commends the merit system and the party's declaration that it stands committed to the principle of civil service reform. In conclusion he says:

"The issues are joined, and the people must render the verdict. Shall economy of administration be demanded, or shall extravagance be encouraged? Shall the wrongdoer be brought to bay by the people, or must justice wait upon political oligarchy? Shall our Government stand for equal opportunity, or for special privilege? Shall it remain a Government of law, or become one of individual caprice? Shall we cling to the rule of the people, or shall we embrace beneficent despotism? With calmness and confidence we await the people's verdict."

Other Political Topics

In his letter of acceptance Senator Fairbanks reviews the achievement of his party during the last seven years. "We have pursued," he says, "no parsimonious policy on the one hand, nor indulged in extravagance on the other. We have measured the public expense by the public necessity." He expresses a hope that Canada and the United States may "agree in due course to take up the subject of reciprocity." The gold standard, he says, "is no more irrevocably established than are our tariff schedules." It has been established, and safeguards for the maintenance of our silver and paper currency at a parity with it have been provided. "But all of this may be changed at any time by a hostile Congress, or endangered by an unfriendly Secretary of the Treasury."—In a recent speech ex-Senator Davis, candidate for the Vice-Presidency, said that he saw no reason to change the tariff views expressed by him in 1883, when he favored a tariff yielding sufficient revenue for the needs of the Government, and believed that incidental protection was "right and proper." Senator Elkins, Mr. Davis's son-in-law, will take no part in the Republican campaign in West Virginia.—Ex-Senator Peffer, of Kansas, formerly a prominent Populist, will make speeches for the Roosevelt ticket during the remainder of the campaign. Robert Treat Paine, Jr., who has twive been the Democratic nominee for Governor of Massachusetts, publishes his intention to vote for Roosevelt, mainly on account of the latter's attitude toward the negroes. "I have myself dined with Booker Washington," says Mr. Paine, "and would consider it a privilege to do so again."

Prosecution of Lynchers in the South

The prosecution of persons who took part in the lynching of Horace Maples, a negro, at Huntsville, Ala., has thus far been ineffective. Thomas M. Riggins, one of 26 men indicted, was tried on the 22d and acquitted. On the 24th the trial of Silas Worsley ended in the same way. The grand jury in its report called for the impeachment of Sheriff Rogers, Mayor Smith and Chief of Police Overton for wilful neglect of duty. It also

advised that the police force be reorganized, and expressed the opinion that the militia were commanded by incompetent and ignorant officers. These officers are now before a military court of inquiry The grand jury said:

"The issue presented to us is clear cut. We have reached a crisis. The question is whether we shall be ruled by a mob or by the law; whether we shall have anarchy or government, whether an armed and unreasoning rabble whose worst passions have been inflamed and prejudices aroused shall be permitted to trample our statutes under foot and openly commit most atrocious crimes merely because they happen to have brute force at their command, or whether we shall say the law is supreme; it is the only safeguard of our property, our liberty and our lives; it shall be upheld, respected and enforced.

"If we cannot meet the emergency presented to us; if we cannot eradicate the spirit of anarchy from among us; if we cannot curb the lawless element of our country, then we have failed in the highest purpose of our Government, and our boasted institutions are but a delusion and a myth. Realizing that this is the supreme moment of our history, we must either make a stand for law and order to-day or surrender to the mob and to the anarchists for all time."

—At the trial last week, in Mississippi, of W. C. Eastland, charged with having led the mob that burned Louis Holsert and his wife at the stake, and with having applied the torch, United States Senator McLaurin appeared as the defendant's attorney and argued that the burning of these negroes was necessary and justifiable because of the character of their crimes and the riotous conditions prevailing at the time. Upon his motion the judge instructed the jury to bring in a verdict of not guilty, on the ground that there was no evidence against the defendant. Holsert had killed Eastland's brother. Eight persons, a majority of them negroes, were killed before Holsert and his wife were burned.—At Talbotton, Ga., last week, several negroes accused of being members of a Before Day club, which had plotted to kill white men, were discharged by the court for lack of evidence. They were followed to their homes by whites and two of them were shot, receiving wounds which are probably fatal. At a mass meeting of whites money was raised to prosecute the men who attacked the negroes.—At Royston, Ga., on the 18th, John Ware, a negro, who had been arrested for wounding a planter's son in a quarrel, was taken from the officers and lynched.—Mrs. Thomas Boggen, a farmer's wife living near Patton, Pa., while going to visit her mother, on the 22d, was atrociously assaulted by a negro. Three hundred armed farmers, with bloodhounds, scoured the country for the guilty man and were with difficulty prevented from lynching an innocent negro arrested on suspicion.

To Call Another Peace Conference

President Roosevelt received at the White House, last Saturday, the members of the Interparliamentary Union, nearly 200 in number, and in response to their request said that at an early date he would ask the leading nations of the world to join in a second conference at The Hague for the further promotion of international peace. The visitors were introduced by Representative Bartholdt, who said that the Union has looked to Mr. Roosevelt as a friend of its cause ever since he had referred the Venezuela controversy to The Hague Court. "It is now generally admitted," he continued, "that this your action, together with the Pious Fund precedent, which also occurred under your Administration, saved the life of that great international tribunal." The Union believed, he added, that the people would applaud if the President should convene a second conference to complete the work begun at the first, "in the negotiation of further arbitration treaties and in the establishment of an international parliament for the consideration of questions which are of common concern to all." The resolutions adopted at St. Louis, which we published last week, were then presented by Dr. Albert Gobat, of Switzerland, who spoke at length. Referring to The Hague conference, he said:

"We look upon this institution as the starting point of the most important evolution ever entered into by mankind. It will at last embody the brotherhood of peoples, that community of the intellectual and material interests of nations that has always existed, but never until this day so imperatively demanded that it be recognized, furthered and protected. The general conferences of States will regulate for the latter that which has been regulated

for private persons for fifty centuries; they will make international arbitration compulsory; they will see to it that treaties are faithfully observed; they will avert disputes; they will relieve the people of overwhelming burdens imposed by criminal whims. But in order to accomplish its duty, this institution must also be made the foundation of a political organization of the world."

To that end, he continued, the conferences must be periodical, and there should be an organ vested with supervising, directive and executive powers in the time intervening between successive general assemblies. The Union had deemed Mr. Roosevelt, as an earnest defender of international justice, especially fitted to assume the initiative with respect to a second conference. Responding, the President thanked the Union for its kind allusions to the attitude of the United States, which, he said, would continue unchanged:

"We are even now taking steps to secure arbitration treaties with all other Governments which are willing to enter into them with us. In response to to your resolutions, I shall at an early date ask the other nations to join in a second congress at The Hague."

This second conference, he continued, should push forward toward completion the work already begun. At the first conference several questions were left unsettled, and express provision had been made for a second meeting:

"It would be visionary to expect too immediate success for the great cause you are championing, but very substantial progress can be made if we strive with resolution and good sense toward the goal of securing among the nations of the earth, as among individuals of each nation, a just sense of responsibility in each toward others, and a just recognition in each of the rights of others. The right and the responsibility must go hand in hand. Our effort must be unceasing both to secure in each nation full acknowledgment of the rights of others and to bring about in each nation an ever-growing sense of its own responsibilities."

Labor Controversies

The end of the strike of workmen in the building trades at New York appears to be at hand, owing to the withdrawal of 2,000 marble cutters from the ranks of the strikers at the suggestion of their leader, who has been president of the association of walking delegates since the arrest of President Weinseimer for extortion. The strikers have lost $3,000,000 in wages.—After many conferences the organized blacksmiths employed in the New York shipyards, who demanded the closed shop, have accepted their employers' offer to pay the old wages, upon the basis of an open shop.—A wage reduction of from 10 to 20 per cent. has been accepted by the 1,200 employees of the Passaic Steel Company. An agreement involving a reduction of 10 per cent. for the coming year has been reached by the manufacturers of window glass and their workmen.—Two union men who were prosecuted in Indianapolis by an employers' association for assaulting a fellow workman because he refused to go on strike, have been fined $300 each and sent to jail for six months. For disobeying an injunction of the Federal Court in Omaha, during the recent strike of the beef workers, the secretary of the local butchers' union has been fined $250, and 34 members of the union must pay $20 each.

Discussions of the Scotch Case

The British journals are not tired of discussing the verdict of the House of Lords in the Free Church case, and it is likely to enter seriously into political matters, at least in Scotland. The Duke of Argyll writes an interesting letter on the subject. He says that when the decision was made by the seven selected judges there were only two or three peers that took the trouble to be present, altho it was a decision that affects all religious bodies that have funded wealth. It "affects all British Churches that do not by their constitution formally allow their members to 'agree to differ,' a liberty seldom given to Churches in words, tho nearly always practiced in action." The Scots Free Church, he says, happens to be the first "caught out" under the ruling, and others may share the same fate. The Duke of Argyll suggests that both parties appeal to Parliament by mutual arrangement. He suggests that the property which causes the trouble be divided according to the wishes of those who gave the endowments. It might be that all given from the first constitution of the Church in 1843 until the date of 1872, when the Free Church made a pro-

nouncement in favor of union with the United Church, be given to the "Wee Frees," while all given since 1872 be given to the recently united bodies, and he thus concludes:

"I think for the credit of Presbyterianism such a settlement might be made, and what Dr. Chalmers (the founder of the Free Church) used to call 'the expulsive force of a new affection' be lessened in its evil, by common sense, which may be held to be religious, tho 'common.'"

Another remarkable address which has made a good deal of talk is from Neil J. Kennedy, Professor of Law in Aberdeen University, an institution which is claimed under the decision by the "Wee Frees." It was given at a demonstration in Aberdeen attended by 3,000 persons. He complained (as reported in *The British Weekly*) that Lord Halsbury had turned the House of Lords Scotch appeal into an English Court of Law. Lord Halsbury had exercised, he thought, a more or less new but a most dangerous power in selecting at his pleasure—after the first equal division had taken place—the remaining seven judges who were to sit with him for the rehearing. Professor Kennedy declared that he knew nothing more unconstitutional. Lord Halsbury could not touch the four law lords of appeal—they were at the moment equally divided, two for and two against—but he invited to the hearing, after the first equal division, the Lord Chief Justice, Lord Alverstone, and Lord James who had never held any judicial office at all. We quote:

"Lord Eldon had left on record a memorandum of the principles that guided him in dealing with Scotch appeals. He said he tried to master Scotch law, but he felt it a great weight on his conscience, and when he had a unanimous judgment of the Scotch judges to deal with it was his practice to send it back to them to a full court for further enlightenment and fuller information. Why was not the case sent back to the whole thirteen Scotch judges? Or if not, there were three Scotch judges who had not heard the case and were qualified to sit in the House of Lords on the rehearing—Lord Kinross, Lord Moncreiff and Lord Kinnear—every one of whom enjoyed the confidence of the profession and the public of Scotland. Well, Lord Kinross went up and made all his preparations, but he was dissuaded—he did not know why. But there still remained two, and if they were to get fair play and justice, Lord Halsbury ought to have called these other two Scotch judges who were qualified to sit as part of the court, instead of two English lawyers."

It is Professor Kennedy's view that those who gave their money for the whole Church, and now find that it is given where they did not wish it, should now demand it back, or their heirs do the same. Many utterances have been made in approval of Professor Kennedy's bold criticisms, and particularly of the fact that Scotch judges were set aside for English and Irish judges devoted to Church establishment, one of whom had never sat on the bench.

Our Protest to Russia

It was on August 30th that Secretary Hay made a vigorous protest against the Russian decision in the case of the cargo of the seized steamer "Arabia." It condemned Russia's position as to conditional and absolute contraband of war, and expressed regret and concern of the attitude taken. The goods had been consigned to commercial houses in Japanese ports, and while they might be used as food, etc., for an army they might also have been for home consumption. Secretary Hay showed that the Russian decision would inhibit all legitimate commerce with Japan, and with this interpretation the United States could not agree. Nor could we admit that railroad, telegraphic and telephonic materials are contraband simply because sent to a belligerent port, but only when proved that they are for use by an enemy in war. He said:

"If the principle declared by the Vladivostok prize court, which has not, so far, been disavowed or explained by his Imperial Majesty's Government, is acquiesced in it will mean, if carried to full execution, the complete destruction of all neutral commerce with the non-combatant population of Japan. It would obviate the necessity for blockades. It would render meaningless the principle of the declaration of Paris, set forth in the imperial order of February 29th, that a blockade in order to be obligatory must be effective. It would obliterate all distinction between commerce in contraband and non-contraband goods, and is in effect a declaration of war against commerce of every description between the people of neutral and those of a belligerent State."

Ambassador McCormick notified Secretary Hay last week that the Russian

Government has practically yielded our contention and reversed its position.

Port Arthur

The past week has been given to a most vigorous assault on the fortress of Port Arthur. As we have absolutely no official reports from either side, and no reporters are allowed, all the news received comes either from Chinese who have escaped or from vessels that have seen and heard the firing at a distance of ten miles. All reports have therefore to be received with caution, but the general facts seem to be fairly trustworthy. The Japanese are compelled to attempt even at great sacrifice of life the reduction of the fortress. It must not be allowed to remain in Russian hands when the Baltic squadron shall arrive, as seems likely, for that will necessarily divide the Japanese squadron, and may utterly destroy the control of the sea now possessed by Japan, and on which she depends for the supply of her troops in Manchuria. Similarly, it is necessary that the Russian vessels now safely in harbor shall be captured or destroyed to prevent another raid or their joining the powerful Baltic squadron. According to the news from Chinese sources the attack on Port Arthur began Monday of last week, and continues without intermission. It has been partially successful, it is said, three important forts and six smaller ones between Suei-sze-ying and Rihlungshan (not on our map) having been captured. First, it is said, the forts south of Suei-sze-ying were captured by assault after long battering with artillery, and next Fort Kuropatkin, south of Palichwang, which is said to control the water supply, near Keekwan, was taken after severe fighting, and gave the Japanese a base against Rihlungshan. This was on September 20th. On the same day the Japanese, who seem now to hold Etseshan, captured a supplementary fort near by which threatened it, and in the night another supplementary fort a little less than two miles west of Etseshan, where they met a very stubborn resistance and nearly all the defenders were killed. The Russians have mounted new guns in the rocky precipices of Liaotishan, and use their ammunition freely. No further news has been received since September 21st, when fighting was still going on, but it is believed at Tokyo that six forts in the second line of defense have been captured since September 19th, and hopes are again high of a speedy reduction of the fortress. The Japanese sources put their losses in the present attacks as under 3,000, which may be moderate, as Russian advices put them much higher.

A Second Russian Army

While no striking movements have taken place in the fighting about Mukden the past week, it is clear that General Oyama is again attempting to turn the Russian left north of Mukden, or, perhaps, at the Tie Pass. Each side screens its movements as far as possible. General Kuroki is reported to have crossed the Hun River at a considerable distance east of Mukden, where both armies would prefer to respect the sacred tombs, and to be taking the direct line for the Tie Pass, while carefully protecting his connections at Bentsiaputse. It is said at St. Petersburg that General Kuropatkin has already been reinforced since September 9th by 170 guns and 85,000 men, and that of 22,000 wounded men at Harbin 15,000 will be in service in a few days. It is announced that two Russian Generals, Orloff and one other, have been dropped from the army for their failure and disobedience in the late battles about Liaoyang. But the principal event of the week in connection with the prosecution of the war is the announcement by the Czar of the intended organization of an entire new army to be under the command of General Grippenberg and to number 300,000 men. This will leave General Kuropatkin of equal rank and in command of the first army. The Czar says in an autograph letter to General Grippenberg:

"The intense energy with which Japan is conducting the war and the stubbornness and high warlike qualities displayed by the Japanese impel me to strengthen considerably the forces at the front in order to attain decisive success in the shortest possible time."

Generals Kuropatkin and Grippenberg will probably be under the supreme com-

mand of the Grand Duke Nicholas. Grippenberg is 66 years old, and a Lutheran, thus two years beyond the age at which we retire our army officers. He will start for the East in October, but his army cannot be in readiness, probably, till the campaign of next spring. General Linevitch, who, it was expected, would receive this command, will remain in charge about Vladivostok. It is supposed that three months will bring three corps to Harbin, inasmuch as the completion of the railroad about Lake Baikal will double the number of troops that can be transported, thus bringing the Russian force to 500,000, subsequently to be raised to 700,000. All this is apparently intended to silence any proposals for peace and to show that Russia will put forth such gigantic efforts as will overwhelm her adversary.—There are unpleasant reports that the Russians who accepted parole to remain with the "Lena" at San Frncisco and not go beyond San Francisco have broken their parole in large numbers and are scattered over the country, some on their way back to Russia, where they would be in demand as gunners on other ships. The Russians, of course, are greatly concerned about their fleet, and the Chinese papers declare that their ships in Port Arthur have been ordered to leave at all hazards, and rumors declare that they have done so and have met the Japanese at sea.

Various Items

The English Engineering and Shipbuilding Trades Federation has decided that the premium, or honors, system, which had been imported by agreement of the Amalgamated Engineers and Employers' Federation from the United States, must be utterly condemned. They declare it the most pernicious and degrading condition of employment in modern industrial history, a renewal of the odious task system. They say it creates jealousy and ill feeling in the workshop, with endless bickering, and is the cause of more men being discharged than any strikes in the history of these trades, and that it prevents men of waning physical power from obtaining employment except in the busiest times. They condemn any system except hour and piece work. The journals regret the decision as another blow to British industry.—The Italian strike is virtually restricted to Milan and Genoa. It is a protest against the use of firearms in repression of economic riots. In Rome the restraint of the military has prevented much disturbance.—The Viceroys in Southern China have sent to Pekin warnings against the danger of French aggression. The Viceroy of Liangwan reports that the French troops on the Anam border threaten to invade the province on the pretext of suppressing rebels there, and the Governor of Hunau makes a similar report. He says the French Consul in Hankau has notified a Catholic mission that if necessary a warship will be dispatched for the protection of the French churches.—An attempt was made September 22d by a young man to shoot the Prefect of Odessa as he was inspecting a new building in company with Prince Obolensky, an aide to the Czar. The shot missed its aim and the young man was seized by the Prince and arrested.—King Peter of Servia was crowned at Belgrade, September 21st, in the presence of representatives of most of the Powers. But the Russian Minister was not present, as Russia is not yet ready to condone the assassination of the late King and Queen last year. The most interesting incident of the affair was the painful attempt of the King to wear the thirty pound bronze crown, made from a gun used by the first Karageorge, leader of the insurrection against Turkey in 1804 and founder of the dynasty now represented by Peter Karageorgevitch.—Russia has presented to the court at Pekin a protest against the British treaty with Tibet. It claims that the treaty would involve the abandonment by China of her suzerainty over Tibet should she ratify the treaty, thus creating a British protectorate. On June 2d the British Government assured the Russian Ambassador in a special memorandum that Great Britain would not maintain a military occupation of Tibet nor establish a protectorate, and that she would respect the integrity of China. Russia holds that as the treaty allows England to hold Chumbi Valley under certain circumstances it is a violation of the terms as to military occupation. Great Britain claims that Chumbi Valley is not really a part of Tibet, tho subject to its jurisdiction.

Wisdom's Goal

BY MUTSUHITO,

HIS MAJESTY, THE EMPEROR OF JAPAN.

(The following poem was written for the students at the Peeresses' School of Tokyo. It is translated by our Japanese correspondent, Arthur Lloyd.—EDITOR).

The water placed in goblet, bowl or cup
Changes its form to its receptacle ;
And so our plastic souls take various shapes
And characters of good or ill, to fit
The good or evil in the friends we choose.
Therefore be ever careful in your choice of friends,
And let your special love be given to those
Whose strength of character may prove the whip,
That drives you ever to fair Wisdom's goal.

TOKYO, JAPAN.

Our Business Diplomats

BY ONE OF THEM

[For obvious reasons the author of the following article does not sign his name, but he is the President of a prominent manufacturing corporation and is known to the editors, who vouch for his honesty and for the accuracy of the facts, though names and places are so changed as not to be recognizable.—EDITOR.]

EUROPEANS sometimes say that we in the United States have no diplomats, that we have not trained or grown any, that we do not know what diplomacy is. Their definition of diplomacy is to obtain what you want by intrigue, indirection and corruption, and they confine diplomacy to politics and statecraft. They quote Talleyrand, that past master of Old World diplomacy, when he said that language was devised not to tell your thought, but to hide it.

This half-sneer of Europeans is true if we look only at foreign politics. Our foreign ministers and ambassadors have usually wanted little, but have clearly known what they wanted and have gone straight for it with so much vigor that the other side generally yielded, with much astonishment at such queer, direct methods. But our foreign friends have made the mistake of thinking that politics, and particularly foreign politics, is with us, as with them, a life interest. It is not. Politics at present is only an exciting game—some day it may develop into dead earnest when the Demos awakes—and foreign politics is rather of a bore, to be confined to the pages of some heavy review.

When it becomes necessary, we will train men to diplomacy or take them out of the vast and growing army of business diplomats. To business has our talent—yes, genius—for diplomacy, turned, and in business have we trained a vast and growing army of diplomats, men who travel all over the country selling goods, closing deals, making contracts. These are our real diplomats and of these foreign critics know little. Occasionally one of our business diplomats is appointed as a foreign consul or minister, and the astonished natives think him the exception that proves the rule.

What are the methods of these, our business diplomats? The average commercial traveler who visits towns of from ten to a hundred thousand and interviews either some member or a trusty and well-supervised employee of the firm he sells to, is usually a companionable, quick, adaptable, fine fellow. He must know his goods, his competitors' goods and how to handle men. Knowing these, he can be successful and exercise a real function in spreading information, adapting his wares to the market's needs, and in making the wheels of commerce run smoothly. There is a slight opportunity for intrigue and indirection in getting the good will of clerks, etc., but it is small, and there is almost no opportunity for corruption. He generally sells to the owner of the concern, and to compel the owner to do something contrary to his own advantage is unthinkable.

But the growth of large corporations, where the buying is separate from the ownership, where the buyer's personal interest may be worked on if he is at all susceptible to corruption or blinded if he is not very shrewd, has opened the business field for the Old World diplomacy of intrigue and corruption, and corruption flourishes there in a way that few appreciate.

How do I know? For over a quarter of a century I have traveled over the United States and Canada, going to every large city and selling goods in every State save those that have no large cities. I have traveled over 50,000 miles in one year, and, with possibly one exception, I have traveled at least 25,000 miles every year. I am not traveling so much now, but do go at least once a year to the principal cities and have a force of travelers whom I direct.

We sell to some large corporations, and in some I feel sure there is no corruption, at least in the departments with

which our firm has dealings. Judging by our experience, I should say that there was no corruption in the Pennsylvania Railroad Company's buying, nor in that of the Baltimore & Ohio Railroad. But there are railroads that neither I nor my men call on. There is no use. Unless we buy the buyer, we cannot sell to them. The same is true of some department stores and other corporations.

Rarely is the bribe made openly. A little while ago the buyer of one of the largest railroad systems—a household word in the section it covers—entered the store of our agent and said: "Well, boys, I haven't been in to look you over for a long time. You have a good stock." "Yes," one of the partners replied; "but we do not sell you as much as we ought to. Anything to-day?" After some little talk he gave them a small order and a chance to estimate on a larger one, and then he came to the real gist of his visit quite incidentally, saying: "I've a payment to meet to-morrow of $200, and wonder if you boys could help me out." And as they looked a little encouraging, he continued: "You know my position won't allow me to give a note and there'd be no receipt." My friend replied that they were not in the banking business, and they parted as friends; but future orders were few and far between and rarely did they get any business when they bid on specifications; some other man was just under. The business went to another house, who have been known to give "commissions," as this form of corruption is euphemistically called. I have reason to believe that that railroad is rotten all through, from the buying of ties on some dinky branch to its president, who has been proved to have bought Congressmen and even United States Senators, and who, it is claimed, stole thousands of acres of public lands.

In another case I asked a member of a large firm handling our goods if he could not get a certain railroad to use them, as we were doing better than any house in the country on certain lines. He smiled quizzically and then said: "We have sold the X. & Z. road some small articles for years, but not much till about two years ago, when they began to send orders in to us, and some of them were good-sized ones. It was brought to my attention and I personally made them special prices and gave instructions that the orders should be filled with great care and promptness. This went on for a month or six weeks and in comes Mr. Blank, the general purchasing agent, and asks for me. We have a nice talk and I assure him that we appreciate his business and will do all we can to make the relations satisfactory and that I have made them some specially low prices. He replies that the prices are all right and after some general talk, says: 'There is just one thing we want, it is not much and we have had it from others and feel sure you'll do the same. We want to see your books and divide profits.' I looked a little astonished, and he continued: 'Oh, that's all right; a part of it goes to Mr. Smith.' And Mr. Smith is the president of that road." Here was a thoroughly worked out system of corruption, in which the more the dealer charged, the more came to the purchasing agent, who shared the money with the president, and likely with other officers of the road. If I should tell the real name of that president it would be recognized in every railroad office in the land. Moreover, it had become such a commonplace matter with them all that the moral baseness of it was not thought of.

But if a man does not practice this corruption and avoids the places where he knows it is, the surest source of information is the talks with fellow travelers. They meet in hotels and cars and quick intimacies spring up, in which many matters which might otherwise be hidden are freely talked of. The free masonry of the craft unlocks lips that would otherwise be shut.

About six months ago my business took me to San Francisco. It is a long ride and for two days we met on the common footing of the sleeping and dining cars with nothing to do but talk, play cards, write an occasional letter and eat. The second day out four or five travelers, who had gotten well acquainted, started talking on this subject of business diplomacy. It could easily be seen that all were masters in the art of adapting themselves to each other and to circumstances. In the freedom of this

enforced intimacy and leisure each spoke candidly.

One was selling cloaks and dresses, representing one of the largest manufacturers in the country. He said: "Why, of course, I give presents, or, if you prefer to call it so, commissions and bribes. You can't do business in any other way. I'm not paid a salary of $10,000 a year to hesitate at a little check giving, when I can't get the business otherwise. They all do it. You know the case of Brown, who bought for A. & B. (mentioning one of the largest department stores in New York City). He used to turn over to C. & D. (a prominent manufacturer of cloaks and dresses) business to the amount of $300,000 or $400,000 a year. They gave him a brown stone house up town in New York, where he lived for years. Every one knew it, and it is said that both A. and B. knew it at the time, but they said they did not care if Brown did get houses and money, that he had made his department pay big profits and that was what they looked at. Later on C. & D. actually made Brown one of the partners in their firm, so that he shared in their profits, and he was still the buyer for A. & B."

Later, when others had talked, he said: "I have an understanding with my house that I can draw up to $25,000 a year and no questions asked. I always carry several thousand dollars with me." And here he showed a roll of bills. "Ofttimes I meet a squeamish cuss and have to handle him with gloves. I'll get him around to my hotel in the evening and we'll have drinks and cigars served and a little game of poker; of course, I always lose. Nothing is said, but I book a good sized order before I go, and really that is one of the cheapest methods; when the man comes right out and asks for money, then I usually have to pay a big price. Once after I had lost $300 at cards the buyer wasn't going to give me a decent order; if I had not suggested that his boss would not like to know how heavily he had played poker with me, I'd have lost both that order and my money. The next time I went to his city he came to my rooms and we had our game of poker, but I can play when I want to and handle the cards a little. I saw that he drank heavily and before midnight he owed me $700. You never saw such a scared man. I got his I. O. U.'s before he left. Then I persuaded him to have just one more round and I lost $100 to him and gave him back part of his signatures. The next morning I said he need not worry, but pay me when he could. Then I got him to my sample rooms, and when we got half through the order I saw it was not going to be as large as I wanted, so I suggested that he increase this item and add that other. He looked a little queer; so I took out one of the I. O. U.'s and tore it up and handed it to him. He increased the order as I wished and before we got through it was over $10,000. I then tore the others up and gave them to him; he was mightily relieved. The next day I gave him three one hundred dollar bills. Since then he never plays poker with me, but I always give him money."

"How much do you have to pay?" I asked. "Oh! It depends on the man and the size of the order; sometimes nothing, but then I have to make specially low prices; at other times as high as three per cent. of the order, but above that is rare."

There was silence for a moment and then an elderly, fine looking gentleman said, meditatively: "I'm an insurance adjuster, and you would not think that I ever had to use money, but I do. On the small losses and losses in the country there is never any trouble, tho often we have to pay far more than the value of the goods burned. But these losses I do not attend to, but only see to the big ones in the large cities, where the loss will amount to hundreds of thousands and occasionally to millions. They usually get one of these firms of adjusters—I work for the companies—to manage their interests. If I only had the principals to deal with it would be an easy matter. It would take time, because the owners naturally think their property is worth more than it really is, but tact and management will usually pull the toughest matter through. But when one of these infernal Jew or Yankee adjusters gets hold of a big loss and ties up the owners with a contract to do all the business through him, there is only one thing to do, and that is to buy the ad-

juster. Why, in that big fire of —— hotel there was only a partial loss and we hitched and haggled how much it should be for three weary weeks. That adjuster would not come into the open and say how much he wanted; if he had I would have gone straight to the old man and then we'd have had a row. I did suggest one day to the owner that the adjuster was crooked and found for my pains that the adjuster had informed him that I wanted a bribe. Well, it went on and on, and one day I said to that adjuster that if he'd settle for $250,000 —they wanted $350,000—I'd leave an envelope at his hotel for him in the morning. He was shrewd and replied: 'You leave the envelope and I'll see.' So next morning I left an envelope with two thousand dollar bills in it. He met me with a smile and said: 'Oh, why leave so small an envelope: leave a larger one." I had to leave three envelopes containing $15,000 before he came down and I positively refused to leave any more, but said that it could go to the courts. We then settled for $260,000 and a few odd dollars. The amount over the $250,000 was put on to save my friend's face, as the Chinese say. But this was really a saving to the companies, as they had planned to come up to $300,000 if necessary. It always hurts an insurance company to let anything go into the courts. Some months after I accidentally found that the adjuster had gotten over $10,000 from the old man to use as a bribe for me."

"Well," said a keen, well-dressed, youngish man, who I had noticed was traveling on a pass; "you would not think that ticket brokers or scalpers would have to do any of that. There was a time when it wasn't necessary, as we were the ones who were hunted up and offered inducements. We did business in ———, and the X. & Y. is one of that city's principal outlets. Of course, we had to sell tickets cheaper than the railroads sold them or we could not do any business, but so fierce was the competition that we could do almost anything we wanted with them. For years we had an agreement with the X. & Y. by which we bought regular tickets much lower than the office rate which the average man paid when he went to buy a ticket. In some instances our price was as low as a third of the regular rates. Of course, we guaranteed them and the X. & Y. stood behind that guarantee, and only once in a great while was any ticket we sold ever taken up on the cars, and when it was the X. & Y. paid us the money that was collected on it. They had agreed to do it and they always did. We found them a very square road to do business with. Their general passenger agent came around once a year and he went over our accounts and settled with a check, but we never could get anything more than a verbal agreement from him. Last year the presidents of the different roads got together and agreed to turn down all these verbal agreements at once. We did not know what had struck us and so began a law suit. We thought at first that we would have to pay the passenger agent of the X. & Y. something and tried it, but found it was out of his hands. The public thought we were getting our tickets from passengers, but nine-tenths of them came from the railroads, and there was a time when far more money was taken in by the scalpers' ticket offices in many of the large Western cities than by the regular ticket offices." "Why!" said one man in surprise; "was this done after the Interstate Commerce law went into effect? I thought that law stopped all that." "It was done up to the winter of 1904, and we all knew it, tho, of course, the public did not." "When," I asked, "these facts came out in your suit under your affidavit, did the Interstate Commerce Commission take any cognizance of it?" "Not a bit," was his answer.

Later a stationery traveler told us the case of Clay, who bought the stationery for the big department store of X., Y. & Z., in ——. He had heard that Clay wanted money to give any large order. He had sold Clay small bills, but nothing large, till one day he got him around to his hotel and got a good-sized bill out of him, but Clay said the order would have to be O.K.'d by one of the firm and for him to come around about 5 p.m. for it. They had had cigars and liquors, but he had not responded to Clay's suggestions as to something more. It took over half a day to get the order

into shape. At night he was told by the member of the firm who O.K.'d the orders, that they had decided not to place that order. He was quite indignant and wanted to know the reason, but could get none and then went to Clay, who only said: "I don't know unless you know." Two months after this his firm and all the firms from whom X., Y. & Z. bought stationery received a circular letter from X., Y. & Z., saying they had just found out that Clay had been taking commissions for placing their orders for stationery. They did not know how long it had been going on and they did not know how much, but that no commissions were ever necessary to be paid to secure their orders and they should have known of the honesty of their employees and that they wished any firms who had paid these bribes to let them know the amount and they would reimburse them for it. The traveler said he thought X., Y. & Z. were a little old-fashioned in their ideas of honesty, but that it was a fine thing to do. I asked him: "Do you know how much they paid out?" "Oh! no," he replied; "I reckon that went into their confidential ledger and that only three or four parties actually know. But it was commonly rumored that it ran into the thousands. The next time I was there I got an order, and when it was O.K.'d I saw this member of the firm who had refused to give me the order before, and asked him out and out if Clay had not told him not to give me the former order. He said Clay had, and I told him that our firm had never given commissions and that Clay had hinted at it before and probably thought he would give me a lesson. This member of the firm replied that he was glad to find out one honest man and honest concern."

"Did they prosecute Clay?" I asked. "Oh! no," he replied. "What was the use? They could not have gotten much money out of him even if, after a very difficult trial, they had secured his conviction, and then look at the publicity and the very bad advertising such a trial would give them. The general public knowledge that there had been such corruption in their store would have hurt them for years. They kept it just as quiet as possible and Clay was simply discharged, but he has a position with another department store in the East now, tho X., Y. & Z. have not hesitated to tell his record where necessary."

A fine elderly gentleman had joined our group while the talk was going on and here he leaned forward and said: "I am a physician and have heard there was some corruption in getting appointments for hospitals, but as I have a large private practice, I have never sought the hospital practice, but most of us think the Standard Oil Company one of the keenest business concerns in the country and that tho they do not hesitate to use corruption when necessary, that they detect and ferret out corruption in their own business very quickly, but I actually know where their agent in our locality has been paid sums of money running into the thousands not to bid on certain contracts. I know of one case where he received $3,000 and another of $4,000 not to be in the market for a month with any large quantity of oil. Their agent is one of the smoothest, keenest business men I know, and he would be unable to get cars or there would be a break down in their machinery or something would happen at just the right time. He has worked it so that he still stays with the Standard."

And so the talk drifted on. I could give many instances more, and on these could give the names and places. I am convinced of the truth of these instances, not only because of the manner in which they were told and the circumstantiality with which they were told, but also because of my general knowledge. I feel sure they might easily be true.

As I have already said, they do not happen in small concerns, where the owner buys for himself, but in large concerns, where the buyer buys for another. Our concern sells the United States Government perhaps more of the goods we make than any other concern in the United States. I have personally managed that business for twenty years. I have never given a bribe or commission. Once the buyer in the United States Treasury kept me till late in the afternoon and we went out together. He is a gentleman in every way and we had had a very interesting talk, in which I had given him some information that was of

value. I asked him to my hotel to supper. "No," he replied; "if we were not buying from your firm I would gladly come, but while there would be nothing wrong in it, I feel that I should not do anything that might even occasion talk. Come around to-morrow and we will finish our talk."

I am positive that in some of the departments there has been no corruption for at least twenty years. I have suspected some corruption in the Post Office Department recently, and last year spent two days in looking into it, and later the First Assistant Postmaster-General, Mr. Wynne, took it up at my suggestion, and a partial investigation was made. It proved stupidity and that the department had gotten into ruts and that it moved very slowly, but nothing more, and that was what I thought after I had made my investigation, and that was what General Wynne thought when I had had my talk with him. He gave me every facility and was exceedingly frank and nice about it. But some of the under men were very touchy about their dignity and very slow to move. They made me doubt whether the evils brought on by the civil service system—these men were protected in their positions by the civil service rules—were not worse than the evils of partisan appointment. At least, fresh men were brought into the departments. But I have seen the same dry rot of ruts, indolence and inefficiency come over large corporations.

In private business there is no publicity of the corruption. When the heads find it out they may remedy it, but that is all, and they keep it quiet. In the largest corporations the ownership is often so divided among a large number of stockholders that even the head officers feel little of the responsibility of ownership. In one of the instances I have given the president and probably other high officers shared in the bribes exacted by the purchasing agent. With the growth of large corporations and the growth of the mere coupon-cutting rich, an entirely new class of men in the world's history, men who have riches and the income flowing from such ownership, but who have no responsibility concerning it, this corruption is rapidly growing. The publicity of public works and the reputation to be gained by uncovering rascality, and also the subtle feeling that every public official has that he is working for the wnole people and not for a private master, makes this form of corruption much less in public than in private business of the same size, and I finally reach from an entirely different line of experience and observation the same conclusion as Mr. Lincoln Steffens, in a recent article in *McClure's,* when he says:

"Not the politician, then, not the bribe-taker but the bribe-giver, the man we are so proud of, our successful business man, he is the source and the sustenance of our bad government. The captain of industry is the man to catch. His is the trail to follow."

The Pitcairn Island Miracle in Ethnology

BY EMILY M. McCOY

[Miss McCoy is the daughter of J. R. McCoy, the Governor of Pitcairn Island, and a direct descendant of one of the mutineers of the "Bounty." For some time past she has been a resident in the United States, studying dentistry and trained nursing, both urgently needed by the members of that small but always interesting community. It is only now, when the people of Pitcairn Island are beginning to emerge from their century of isolation, that the remarkable outcome of a remarkable crime appears in all its strangeness and all its deep significance. From the union of lawless whites with the uncivilized brown people of the Pacific a race—limited, indeed, in numbers—has sprung whose members are living exponents of all that is highest and best in Christian and civilized life. The "race problem" has been solved in Pitcairn as it appears to have been solved nowhere else; and a community of interest has been developed such as existed only in the old Biblical days under the patriarchal and family institutions of Israel.—EDITOR.]

IF New Zealand is Newest England, then a more distant and much smaller—indeed, an almost infinitesimal portion of the British Empire—should be called Freest England. A most hopeful drama of human progress and co-operation is being enacted in a remote yet widely known corner of the world, that much written about little domain—Pitcairn Island.

Miss Emily McCoy, the Author

Divided to-day between about 24 families, it supplies them with all that can be needed for material welfare; and so happy has been the life there that the advent of trade, and the use of money, and the stimulus of gain, are to many a source of regret. At peace among themselves, contented and prosperous and happy, able to educate their young men and women, and to offer help and good cheer to passing ships—there is a surprising contrast with the lawless life of the first settlers, who, mutinying from the "Bounty," and stealing the ship, came to Pitcairn in 1790 with their Tahitian wives and a few retainers.

In the tangle of the race problem which accompanies the increasing empire of the United States, and the struggle of all the white nations of Europe for the golden Orient and darkest Africa, not to mention the supposedly menacing problem of miscegenation within the United States, the example of one hybrid race, geographically isolated and left to work out its own destiny, forms a remarkable ethnological lesson.

The white men of King George's navy who mutinied from the "Bounty," while representing a powerful civilization—some of them from esteemed families and well educated—were withal lawless men. Crazed with thoughts of license amid all that could woo the senses, they cast Lieutenant Bligh, their captain, adrift in the ocean with as many as the boat would hold, and returned to the islands they had lately visited, supplying themselves with wives and a few Tahitian men and women for servants. After allowing some repentant men to leave the ship, the party remaining sailed for a rocky island but recently discovered and charted, named Pitcairn, and there they hid from retributive justice, destroy-

ing all means of escape by burning the "Bounty."

Years of complete isolation followed. They found themselves possessed of a territory unclaimed and uninhabited, except by sea-birds, tho rude carvings, yet preserved, a few human bones and some stone implements told them that others had preceded them.

Here they followed such arts as the tools from the ship allowed, and feasted, and fished, and distilled strong liquor. But little land sufficed for crops; on the rest the goats and swine ranged. A well, or pool, still called "Brown's Well," was digged by one of the men to increase the inadequate water supply.

The gentle brown women from Tahiti loved well their roistering mates. Even the captain, in his report to King George, excuses his men and praises the delicacy and deportment and comeliness of the women of the South Seas.

With tropical fervor and an abundance of liquor firing their blood, the worst excesses became common—struggles to rule, feuds, treachery, wife stealing and murder. In a few years all the Tahitian men had been killed, and all the white men had been killed or had died, excepting one, old John Adams. With approaching death and a pitying realization of the needs of the group of young people, half English, half Tahitian, and the darker descendants of the Tahitian families, all looking to him as sole arbiter there, and sole instructor about the great world, to which by blood and destiny they were linked—Adams, repentant and wiser, sought to rear and teach them as well as he could.

One day, after eighteen years of primitive life, a sail appeared upon the horizon, and a vessel approached the island. Its American captain, to his complete surprise, saw a rude dug-out, or pirogue, coming out to greet him, manned by dark boys, who hailed him in good English.

"We are sons of the mutineers of the ship 'Bounty,'" was their thrilling announcement.

The romance and the novelty of the pathetic story aroused the whole world as fast as news traveled then. England claimed the island and her men's descendants as her own, and dealt more leniently with them and with poor John Adams than she had with the other handful of deserters sought out by her ships long before.

The island was found to be two and one-quarter miles long by one and a half miles wide. Lying two degrees south of the Tropic of Capricorn, the climate is not so extremely hot as in other South Sea islands, nor is it ever very cold there. Extremely rocky and rising precipitously from the sea, which bites into it with two bays, the land is clothed with green continually, from the fern-covered ground to the over-arching, many-rooted banyans and tall cocoanut trees, while the pandanus palm grows to the very edge of the water, splashed with its salt spray.

Everywhere the air is sweet with the flowers of the "high white," or morinda citrifolia, and the moisture laden winds from the ocean constantly refresh the trees upon the high crags, to the highest summit, some eleven hundred feet high, where the cannon of the "Bounty" is mounted, holding the flag of old England.

Adamstown, named for John Adams, is the one village—of about one hundred and fifty people—lying some three hundred feet above Bounty Bay, the port of our little country.

Too distant to be visited oftener than once a year by a British man-of-war, the British Consul at Tahiti has been the nearest Government official. My father, James Russell McCoy, has been successively in office for twenty-six years, as "chief magistrate and ruler in subordination to Her Majesty the Queen of Great Britain," for many years elected every New Year's Day. In 1892 our Government was somewhat changed by a meeting held at Pitcairn, and convened by the Consul at Tahiti and the captain of the man-of-war on its yearly visit.

It was decided that seven members of Parliament be elected, and that they, being elected by general vote, should then elect from their own number the magistrate for the ensuing year. During all this lifetime of service my father has never left the island except in furtherance of Pitcairn's interests—on occasional trips to Tahiti, once to California and once to England, where some lords and ladies were surprised that he was not a wild, black cannibal, instead of the

placid, kindly man they beheld, speaking good English and wearing English clothes, and with a skin but little darker than their own.

We have always been loyally English, and English people showed us kindly sympathy and sent us much of help when we were awakening to our needs, and when that indomitable white blood and the civilization to which we half belonged fired us with zeal and emulation.

From our loving mothers we learned the native arts, the native games and dances. Our little festivities consisted largely of these diversions, and, feasting on native fare, ending with European music, we had gleaned and could execute on poor instruments. Such were our celebrations of our two annual holidays, the Queen's Birthday and the visit of the man-of-war. In 1890 we held a centennial, rejoicing in our own little land, in its peace and comfort, and with humility remembering the dark record of its first years. The schoolhouse, adjoining the church, is the Government house and the City Hall, adapting itself to all needs.

My father is strong, resourceful and kind, quiet and yet jovial, careful of the feelings and rights of others, so straightforward and simple as to amuse the more adroit, yet a man of iron nerve and unlooked for skill and courage in emergency. He was on a trip with the "Pitcairn," the schooner of the Seventh Day Adventist denomination at the Vau Vau Islands. The boat and its surgeons had gone farther down the coast; a child was brought to him for aid which had fallen on some glass and cut the abdomen so that the intestine was exposed. My father at once performed a major operation. It necessitated making a larger incision and replacing the intestine, and sewing up the wall to the muscular layer and the skin. All this my father did, to the admiration of the surgeons on their unexpected return. Dr. A. J. Read, now of Philadelphia, said that, except for bathing the parts in salt water, all had been done that he could have done. It was before the days of antiseptic surgery and my father had never had instruction, nor had he any instruments, except a

Governor McCoy and the Officers of Pitcairn Island's New Trading Vessel, Which Makes Monthly Trips to the Gambier Islands. Only two of the group are not members of the Governor's immediate family. His son sits on the extreme left and his son-in-law, wearing a beard, stands at the younger McCoy's elbow

lancet and a chest of drugs, given to the islanders by a ship's doctor.

His devotion to my mother was most marked and I well recall a fine bureau he brought home to her, with her name "Eliza" in gold letters upon it. He wanted her to feel it was her very own, and it was an expression of his individual taste, just as most men select what they see and like, rather than as we women do—buy something some one tells us is the latest fad.

My father, during my stay abroad, often writes to me of the little incidents of life there and of all that concerns Pitcairn. My aunt, Rosalie Young, is the teacher there; a few others like myself are going to other countries to study, but most of them with the ever present thought of returning, for we are held by the tenderest ties and the strongest of family feeling, since we are all related. In fact, the place is one large family settlement.

In spite of the natural shyness which, in time past, made the women refrain from sitting at table with the men, women have always exercised the right to vote. The very land is apportioned equally between boys and girls, and we girls work on our own plantations. Even when mere babies we Pitcairn girls swim in the sea and run over the crags. Shooting is the great pastime, and our goats are hunted by the young men for meat. On the royal birthday we have shooting matches and singing affairs—that could hardly be called finished performances. To us they are full of excitement, and, with naturally good voices, our young people make the most of all their chances and so rapidly improve. Queen Victoria sent us a fine American organ, which Admiral de Horsey had inscribed "A present from her Majesty the Queen to her loyal and loving Pitcairn Island subjects, in appreciation of their domestic virtues." The first song we sang beside it was a fervent "God Save the Queen." I recall a night when the man-of-war had just arrived, and all we girls and the young men had gathered on the cliff nearest to sing a welcome. On board they heard us in the balmy night and, in compliment, they turned the searchlight upon us and the island. It was a new invention then, and the great shafts of light thoroughly alarmed some of the party, who went running away from the scene in terror.

If any questions arise that give trouble Parliament sits and arranges a settlement. For instance, if a man takes a bunch of bananas from a neighbor's patch instead of going to his own, he willingly pays over three in return. Fish are divided into thirteen equal piles after a day's catch, and a man, standing back to the lot, calls out a name, as another man, of course unseen by him, lays a stick on one of the piles, until all are apportioned. It will be evident how simple are the administration of our laws and the division of property and profits. There are no salaried officials. There is no Government land. While it has long been divided between the families, it is not all cleared and cultivated, for, as it is, much produce goes to waste. The land is divided and subdivided between the growing members of the several families, the oldest son always remaining with the parents.

Years ago it was only after months of waiting that we had a chance of bartering with occasional ships. Sometimes the wife of a captain would give us patterns which would instruct us in the marvels of a fitted and whaleboned waist. The first settlers made tappa cloth from the mulberry tree, and always wore the simplest of loose garments. Needles were so precious that young girls could not learn to sew. Now we have half a dozen sewing machines. Braiding hats and baskets was our continual pleasure and avocation. Our hats are made of palm and sugar cane top, with breadfruit fiber and brown fern for variegated braids; the pure white bamboo bark we get now from Tahiti. We trim them with artificial flowers we make, or with long garlands of the sweet morinda flowers, with which we also wreathe our necks.

As a child I went to school from nine o'clock until one. Our simple studies were made more difficult by lack of textbooks and writing material. After school we were sent to collect candlenuts, which were stuck on the mid-rib of the cocoanut leaves to burn for lights. Now we have lamps and kerosene.

Our houses are still made of boards

Modern Pitcairn Islanders.—The girl sitting on the left is Miss Loretta Young, a descendant of one of the mutineers of the "Bounty," and a cousin of Miss McCoy; the lady beside her is a white missionary and the one on the right is a half caste Tahitian

ripped out by a pit-saw, and the roofs are of thatch. Only two have any glass, but we do not need it, for the weather is not severe. Our coolest months are June, July and August, while from December until February we have our warmest weather.

We have no beef animals. The few brought to the island were so alarming that they kept the people, in fear, in the trees, and so they were killed and no more were imported. We do not miss milk and butter, for we prefer the cocoanut milk and the butter we make from it. The men shoot the goats and sheep for mutton, raise crops, and fish. A frequent household task is the carrying of water from the one supply at the end of the island, for the water from Brown's Well is not always sure to flow, tho conduits have been built to pipe it to the houses. Sometimes we salt a catch of fish, but we can secure fresh fish all the year around.

Our crops are sweet potatoes and yams of several kinds, Irish potatoes, sugar cane, taro, arrowroot, bananas, pineapples and melons. Grains we cannot raise, nor do we feel any real need for them. Sometimes, for the sake of variety, we secure grains and flour from passing ships. At first the bread-fruit tree grew abundantly, but it has not thrived so well of late years. It was to secure this tree for the West Indies that King George fitted out the "Bounty," an armed naval vessel, at the solicitation of Sir Joseph Banks and another scientist. We have orchards of oranges, lemons, limes and citrons and an abundance of mangoes. Guava grows wild, rose apples are plentiful and fresh figs are delicious. We have a few peach trees and one apple tree has been acclimated. With so much fruit we are never hungry, yet as children we are well and active. When I arrived in America I caught the measles. The doctor was surprised that I had not had them. I told him there were no such diseases in Pitcairn, and we never had any disease there but fever caught from a ship—when we had an epidemic of typhus.

Our life is limited, but it is a very happy one. Each year, tho, draws us nearer to the rest of the world; already we are within two days of a steamer route. Some of our young people are engaged in business in Tahiti and in California, and, ere long, arts and manufactures may make the simple forge of the old "Bounty" seem very primitive, and its hand-made nails, from the copper of the ship, great curiosities.

Until very recently we had no money on the island, for all our trade was with the passing ships by barter. We saved,

with care and pride, our bits of silver for special church days, as offerings. Sometimes the long awaited ships would have to pass us by if the weather and sea were unfavorable. Once our young men rescued the crew of an English ship, and in gratitude two boats were sent out to us.

Some time afterward my father went over to Tahiti and arranged with the British Consul for the purchase of a schooner. An American captain taught our young men navigation and sailed with them for some time on the schooner. They are now sailing it themselves with good success, tho recently they nearly lost a man and a boat when cruising with a French scientist on board, and once they failed to make the island of Oeno and had difficulty in getting back. On the whole, they have acquitted themselves well. They sail every month to the Gambier Islands, taking a cargo of Pitcairn's crops and fruits. On those islands such things are not raised. The people make large sums from the pearl fisheries, so they can pay well for the tempting food.

We receive mails regularly now in two months' time from San Francisco, while previously it was any number of months, by most uncertain and varying ways. There is a line of steamers from San Francisco to Tahiti, and from New Zealand to Tahiti, besides many ships from all over the world. From Tahiti to the Gambiers there are a steamer line and many sailing vessels. Three of our Pitcairn people live now at the Gambier Islands to look after our interests and trade. They have built a warehouse for the storage of goods which are for sale or have been purchased for our use. Our constant needs include cloth, utensils, kerosene and other supplies. Books and papers we are eager for, and we have perhaps the freest circulating library in the world.

When some one, high up on the island, calls out in powerful tones, "Ship ahoy!" every one repeats the cry and knows what is expected of every family. The ship may as yet be but a speck, visible only to trained eyes, or her masts only may be above the horizon; but the boat's crew hasten to make ready the boat and launch her, and every one—even the children—hurry to load her. Our men pull very hard toward a point in the ship's course where they hope to be seen. Usually they are successful, and the ship comes about, allowing them to row toward her and go aboard. Very welcome are the melons and pineapples and fresh vegetables they bring the ship's company after long weeks of salt food. We send out not only food, but reading matter, secular and religious, gladly giving and often receiving in exchange. After buying a barrel of crackers, some paint or nails, or whatever the captain can spare, and finishing the visit with singing, our men bid farewell and pull home over the long stretch of sea once more. Sometimes ships sailing to and from South American ports, like Valparaiso, pass our way.

It is, however, our trade with the Gambier Islands that links us to the world

A Tahitian Half Caste Family

and makes us very proud of our tiny merchant marine of one ship, owned by us all and manned by our men.

We have good constitutions, tho so closely related, and we are as healthy and active, from childhood to old age, as a people can well be. For a long time we knew nothing of nursing, other than such as kindliness would suggest and what little we gained from reading, and we had no doctor on the island. Sometimes accidents, such as terrible falls from the slippery cliffs climbing in quest of sea-birds' eggs, would fill us with pity and make us wish to know better what to do in case of accident or illness. In 1893 a ship was wrecked on a reef of Oeno and the crew came in boats to Pitcairn, and they brought with them the appalling typhus fever. I lost my mother and grandfather, a little sister and other relatives. The whole island mourned. After weeks of nursing and anxiety, when the fever passed away, we felt more than ever the need of scientific knowledge and of means to cope with such trouble should it again come to us.

As if in answer to our need, there came help from far-off America. Dr. Braucht and his wife, of the Medical Missionary and Benevolent Association, came to Pitcairn. We had been familiar, years before, with the faith of the Seventh Day Adventists and had rejected their literature. Then we had Elder Gates living among us and had studied well the Bible by their teachings. We had always been Church of England folk, worshiping from the old copy of the Bible and the Book of Common Prayer saved from the "Bounty," until we were supplied with more copies.

After careful reflection we unanimously joined the faith of our American friends. With Dr. and Mrs. Braucht I went to Samoa, and thence came to America, to complete my studies, which I hope will fit me to return to Pitcairn as a nurse and also be able to do some dentistry. For dentistry is much needed there, perhaps because we do not use grains freely and do use the plentiful supply of sugar cane, which we grow and crush and make into syrup.

Rev. Dr. F. E. Braucht and His Wife, Missionaries of the Seventh Day Adventist Church, who have aided in the remarkable "conversion" of all the Pitcairn Islanders from their original allegiance to the Church of England

I often think of my mother when I see what is done in America for the fever patients in the hospitals. I long to go back to my family and relatives. To me, as to all of us, Pitcairn is the world, even tho the wonderful things I am now seeing in the United States overwhelm me with their extensiveness and power beyond all the descriptions my father gave me or books had power to convey.

Considering the race problems confronting the United States on their ac-

quirement of the Philippines, Hawaii and Porto Rico, this Pitcairn Island colony becomes a unique demonstration worthy of study. For, if ever there was a people, as the Psalmist said, "conceived in sin and begotten in iniquity," it was the half-caste population on Pitcairn Island. Yet crime and violence have passed away. Contented, yet ambitious, their island a refuge for suffering and endangered mariners and a bright spot on the pathway of the great Pacific for all ships, the inhabitants of Pitcairn are today "dealing justly, and loving mercy, and walking humbly before God."

The Facts About Lynching

BY GEORGE P. UPTON

[As associate editor of the Chicago *Tribune*, Mr. Upton has long recorded the statistical information of various kinds which is published in the *Tribune* annually, on January 1st. The record of lynchings has been kept since 1881, and since 1885 they have been recorded by Mr. Upton in regular itemized form. They are gathered from the *Tribune's* mail and telegraph service, and from a daily scrutiny of papers printed in the principal cities and towns of every State and Territory. The date, name of victim, race, crime and locality are in every instance recorded. Even in the South the accuracy of Mr. Upton's statistics has never been questioned.—EDITOR.]

THERE has never been a time when the lynching evil has so largely occupied public attention as now, or when it has been discussed more seriously and thoughtfully. It has been forced upon the national consideration not so much by the prevalence of the evil or its alarming increase as by the occasional manifestations of savagery in Northern communities which previously had maintained apparently agreeable relations with the colored race. It seems, therefore, an opportune time to present some facts concerning this dangerous form of mob violence which may give those who are studying the subject ample material for consideration and perhaps some fresh suggestions as to causes and remedies.

What are the facts in the case?

There have been 2,875 lynchings since 1885, as follows:

1885	210	1896	131
1886	162	1897	166
1887	125	1898	127
1888	144	1899	107
1889	175	1900	115
1890	128	1901	101
1891	193	1902	96
1892	236	1903	104
1893	200		
1894	189	Total	2,875
1895	166		

The record of lynchings by States and Territories since 1885 is as follows:

NORTH.			
Indiana	38	Michigan	6
Kansas	38	North Dakota	5
California	33	Nevada	5
Nebraska	33	Minnesota	4
Wyoming	33	Wisconsin	4
Colorado	31	Alaska	4
Montana	29	Maine	3
Idaho	21	Pennsylvania	3
Illinois	19	New York	2
Washington	16	New Jersey	1
Ohio	13	Connecticut	1
Iowa	12	Delaware	1
South Dakota	11		
Oregon	10	Total	376
SOUTH.			
Mississippi	298	Missouri	79
Texas	272	North Carolina	58
Louisiana	261	Indian Territory	54
Georgia	253	West Virginia	43
Alabama	232	Oklahoma	38
Arkansas	207	Maryland	20
Tennessee	191	Arizona	18
Kentucky	148	New Mexico	15
Florida	128		
South Carolina	100	Total	2,499
Virginia	84		

Massachusetts, New Hampshire, Vermont, Rhode Island and Utah are the only States where lynchings have not occurred, tho Connecticut, Delaware and New Jersey have but one to their discredit. This speaks well for four of the

New England States and our new Mormon State. Is this immunity, however, due to a greater respect for law than the other States have shown, or is it due to the comparatively few negroes in their population? Analyzing the results by geographical divisions, lynchings have taken place as follows: South, 2,499; West, 302; Pacific slope, 63; East, 11.

It will be seen by these figures that notwithstanding the South has more than six times as many lynchings as the rest of the country, the evil is not local or sectional. The mania for mob murder has manifested itself in every State save five, and in Indiana, Kansas, Illinois and Delaware mobs have been as cruel and savage in their methods of punishment and their lust for torture as in the most remote and ignorant sections of the South. The cross roads and back settlements of Mississippi and Georgia have witnessed no worse barbarity than was inflicted upon victims by mobs at Pittsburg, Kans.; at Belleville and Danville, Ill., or at Wilmington, Del. To this extent lynching is not merely the disgrace of the South. It is a blot upon American civilization—a national, not a sectional, evil.

What are the causes of lynching?

That it has been an easy matter to find pretexts for lynching is shown by the fact that these 2,875 persons have been sacrificed to the cruelty and fury of the mob for seventy-three different reasons, many of them serious, most of them unjustifiable, some of them grotesque. Whenever a negro is lynched for criminal assault the Southern newspaper, and sometimes the Northern, will headline its "story" or its editorial comment, "Lynched for the usual cause." This glaring misstatement is unjust to the negro race. Criminal assault is not the "usual cause." Persons lynched for this crime since 1885 numbered 564, while 1,099 have been lynched for murder. Adding to the former those lynched for attempted, alleged and suspected criminal assault, for complicity in the crime and for the double crime of criminal assault and murder, the total is 702, as compared with 1,277 cases in which murder was directly or indirectly charged against the victims. About one-third of the blacks and one-sixth of the whites were lynched for criminal assault. Of course, white men are more liable to be hanged or sent to the penitentiary for the crime. It was stated recently, in a letter to the New York *Evening Post*, that "in Sing Sing prison to-day, out of the 1,032 whites, 65 are there for rape. Of the 143 blacks only 2 are there for the same crime." The claim, therefore, that lynching is the summary punishment for a single crime is not only misleading, but dishonest. If any crime can be called "usual," it is murder. Startling as it may seem, statistics will show that murder is the national crime.

Besides the 1,979 cases already mentioned, 896 others have been lynched for no less than 56 different causes, prominent among which are 106 for arson, 326 for theft, burglary and robbery; 94 on account of race prejudice, and 134 unknown persons lynched for unknown reasons. Negroes to the number of 53 have been lynched for simple assaults, 18 for insulting whites and 16 for making threats—offenses which would hardly have been noticed had the offenders been white. Seventeen persons have been lynched merely because they were unpopular in their neighborhoods. Ten were found to be innocent when it was too late. The remaining causes present a heterogeneous array, not one in the list offering the slightest justification for mob murder. Concisely stated, they are slander, miscegenation, informing, drunkenness, fraud, voodooism, violation of contract, resisting arrest, elopement, train-wrecking, poisoning stock, refusing to give evidence, political animosity, disobedience of quarantine regulations, passing counterfeit money, introducing smallpox, concealing criminals, cutting levees, kidnapping, gambling, riots, testifying against whites, seduction, incest, and forcing a child to steal. One young fellow was actually lynched for jilting a girl, who subsequently and quite promptly consoled herself by marrying another. A reformer was lynched for advocating colonization, a colored man for enticing a servant away from her mistress, and a mountaineer for "moonshining." In the beginning of the lynching period under consideration murder and criminal assault were the "usual causes," for at that time other offenses were taken into court.

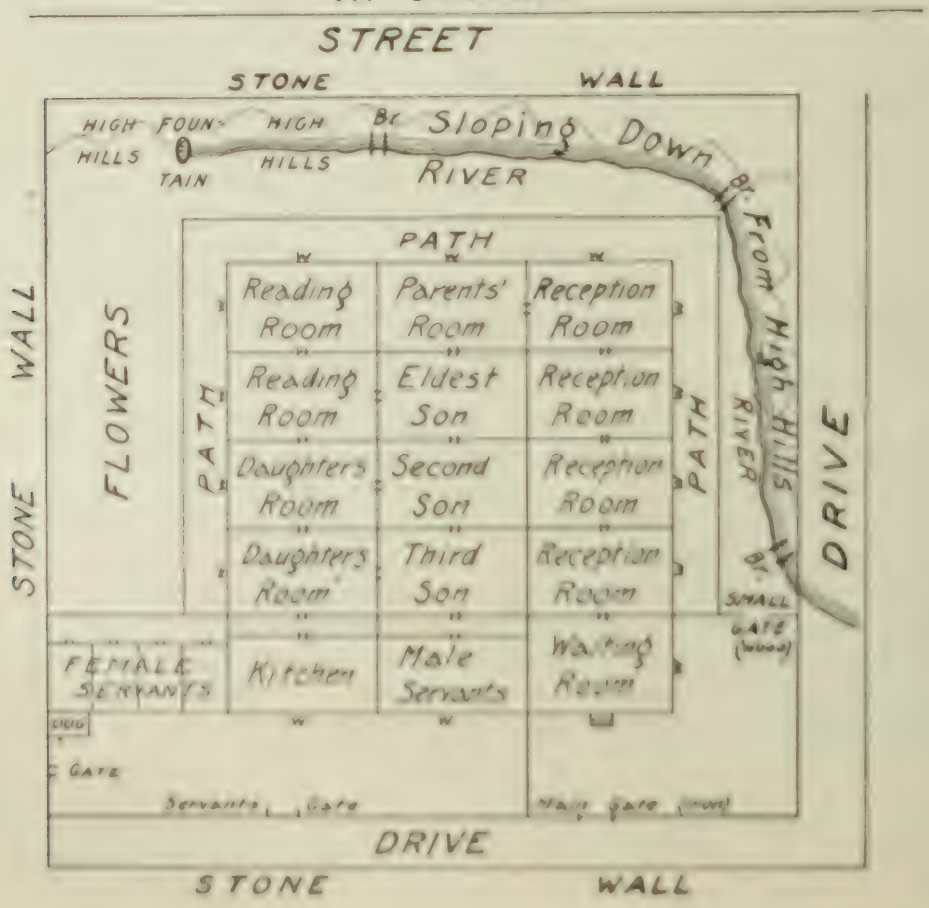
The variety of causes since that time, however, shows how insidiously the evil has progressed. Blacks and whites are now lynched for offenses which have no relation to murder and criminal assault, and many, if not most, of which in a well regulated and law abiding community would be disposed of in the lower courts. How insidious this evil is, how rapidly, when not opposed, it tends to barbarize, is also shown by the exceptionally cruel lynchings which have occurred in Northern communities during the last two years. This shows, as Bishop Candler, of Georgia, recently declared, that "lynching is due to race hatred and not to any horror over any particular crime," and that unless it is checked it may involve anarchy; "for men will go from lynching persons on account of their color to lynching other persons on account of their religion, or their politics, or their business relations." The record already begins to show cases of this kind.

These are gruesome facts and figures, but one who has watched them year after year, who has studied the circumstances of each case of lynching, who has kept track of the increase of repressive legislation and observed its effects, cannot help but note a more encouraging trend of public sentiment. There is a brighter side to the picture. It is impossible not to believe that the lynching evil is on the decrease. It never may be possible entirely to prevent crime. It never may be possible in a country as large as this and with such a heterogeneous population completely to prevent lynching, but it is possible to make it an exceptional crime. There is every reason to believe that things are working to such an accomplishment. The number of lynchings is decreasing. It is encouraging that the number is fast decreasing in those States which formerly were the worst offenders. Both the Governors of Alabama and Mississippi in their messages to the Legislature last year boasted of their immunity from lynching as compared with previous years, and have called attention to the more resolute action of sheriffs and to the excellent working of recent anti-lynching legislation. There is hardly a Southern State which has not adopted repressive measures of some kind and given new powers to Governors and county authorities. It is evident that there is a strong revulsion of feeling in the South and that law-abiding and law-respecting men are doing everything in their power to vindicate justice and restore the authority of the courts. Public prosecutors also are performing their duties more efficiently. Grand juries are growing more courageous. Mob murderers no longer boast of their cruel work, but seek to conceal their share in it. The general agitation of the question which was aroused, as already said, not because of an increase of lynchings in the South, for they are on the decrease, but because of the needless barbarity which recently has characterized lynchings in the North, has been healthy. It has incited the best citizens, North and South, to fresh efforts for the restriction and, if possible, the suppression of the evil. It has come to be recognized, as Justice Brewer said, that lynching is murder, and, as Justice Love said, that in the end it means anarchy, that it is an evil dangerous to civilization, and that if it is not checked it inevitably will increase rapidly under the joint influence of mob cruelty and race hatred.

Another citation from these statistics —and a significant one—indicates there is a brighter side to the picture. While there is a decrease in lynchings there is an increase in legal executions, and this increase is specially noticeable in those States where lynching has been most common. There have been 123 persons legally hanged this year, seventy-eight of them in the South. Five years ago nearly every one of these seventy-eight would have been lynched. Wherever the law works promptly and the authorities are energetic and resolute in its enforcement lynchings decrease and legal executions increase. There is no reason to be discouraged. The outlook is hopeful.

CHICAGO, ILL.

A Japanese Autobiography



BY KATSUKUMA HIGASHI

MY name is Katsukuma Higashi, and I was lately a student in Yale University acquiring more of the Western learning, which I will finally use in some way in Japan. Precisely how I will use it I don't know. My relatives are holding several doors of opportunity open for me, and are trying to call me back to my native land, but I am not yet ready. I must go to Germany first to continue my studies. Some of my relatives are angry at me because I will not go back at once, but I only answer that I still have not enough of the Western learning.

I was born twenty-two years ago in the province of Satsuma, near the town of Kushikino, in the house or castle of my father, who was of the warrior class or knights. Satsuma men are known as the Spartans of Japan, and my father was a leader among these Spartans. He joined in the fight against the new order of things, which was so suddenly inaugurated forty years ago, but when victory lay with the Emperor my father yielded with a good grace, and by his influence aided greatly in pacifying the malcontents of his province, and bringing about a sound peace that gradually led to the unification of the nation which now is seen. The Emperor was thoroughly reconciled to my father, who became a member of the Council of State, and that was the condition of affairs in our family when I was born, the eldest son.

About the time when I arrived Christianity returned to our neighborhood after an absence of some hundreds of years, and my father became the close

PLAN OF MR. HIGASHIS' HOME IN JAPAN.

friend of the Rev. Dr. Brown. Father saw that the religions of Japan were dead, and he was converted to Christianity, tho without outward profession because of the prejudices of his relatives. Mother followed father into Christianity, and we children were all brought up as Christians.

A few years later when father lay dying he put a box in mother's hands, and told her not to open it till he was dead. When the box was opened it was found to contain a Bible.

Not very long after this the missionaries, Clark and Gulick, came to see my mother and family, and when they went away they sent to us a Japanese missionary, who held three services a week. At first we were the only Christians, but soon the congregation grew.

After the death of my father, his brother, my uncle, one of the great men of Japan, came upon the scene as the new head of our family. My mother was under his rule, and all our property was his to administer until I became of age.

My uncle was of the old religion—Shintoism—with its many gods, and tho he was not unfriendly to Christian missionaries, and has since become very friendly to them, he was opposed to our family being Christians; nevertheless, we remained true to the new faith.

I have not yet described the house or castle in which we lived, so I will proceed to do that now, because all about it is so different from what is seen in the houses here that a description may be of interest to American readers. This house was very large, standing in a square that fronted upon the main road from the nearby town. This square contained our garden, and was inclosed by a high stone wall, shutting out the view from the street. It was about 300 feet on each side.

The house itself was about 150 feet square, and all living and sleeping apartments were on the ground floor. The floor above was only used for storage.

On three sides of the house was a garden laid out with a great deal of the art for which Japanese are famous. One whole side of the garden was devoted to flowers. On another side there was a tremendous mountain range in miniature, which sloped gradually down to the level of the carriage drive. Among the crests of the highest mountains a fountain rose and brawled its way over frowning precipices and under beetling crags, through smiling meadows, and past miniature bustling towns, till it flashed out under the stone wall supposedly to the ocean.

On the miniature mountains grew miniature trees and plants suitable to the supposed immense altitudes—lichens and pines and cedars—the vegetation increasing as the hight decreased till the plains were reached, where bloomed the cherry and chrysanthmum.

The little river, too, was as perfect in its way. Goldfish sported in its waters, its quiet pools were gemmed with lilies; rushes, sedges and acquatic plants were found in it.

The house itself was built of wood, but wood that was like iron, perhaps teak. I believe that the building, as it stood, was more than two hundred years old. Sometimes it had the black tiled roof renewed, but that was all.

When a visitor came to our house he was received in the first reception room, unless he was a person of distinction. The more honor we desired to pay him the further in we took him, and those to whom we desired to pay the highest honor were taken into the fourth reception room, next to our parents' chamber.

The windows of our house were of paper, tough, but transparent, and giving a tolerable light. These windows did not slide up and down but sidewise. They were very broad, and not very high. We sometimes used the windows as doors in passing to and from the garden.

The kitchen, as will be seen in the plan which accompanies this article, was separated from the main part of the house by an open passage, so that no odors of cooking penetrated our living rooms. Servants brought us the food, sometimes in one room, sometimes in another, as we fancied. We did not use chairs or stools, but sat in the Oriental fashion. Every room had one or more tables a foot high, and the food was placed on these.

Tho our house was some little distance from the town, there were neighbors of our class about us and enough children to form good romping parties. In my own family there were three boys and two girls. So I had plenty of playfellows.

We boys wrestled a great deal, and

fought battles with singlesticks. We chose sides and pitted army against army, sometimes as many as fifty boys. As soon as a boy was touched by a stick in the hands of another he was supposed to be wounded, and could not fight any more in that particular battle. We also battled with mud balls.

Our public school system is modeled after the American, and as our school hours are much longer than they are here, I graduated from the grammar school at the age of thirteen. My uncle then said that I must go to the military academy, and my mother could not oppose him. However, I was not so submissive. I wanted to go to the Christian school, and finding my uncle bent on making a soldier of me, I ran away from home one night, slipping out of the house when all were asleep. I had no money, and there was a march of 200 miles before me to reach the city of Kumamoto, where I knew I would find Messrs. Gulick and Clark, the Christian missionaries.

That was a very hard journey. Sometimes I slept in the woods, and sometimes I slept by the roadside, and then again in every considerable town I found quarters at the Young Men's house—like the Young Men's Christian Association here, only that it is not Christian.

Messrs. Gulick and Clark welcomed me at the mission school, and got me work to pay for my board and tuition.

It was the hardest sort of work. I had to get up at 4.30 o'clock in the morning and milk the cows, clean the stable, clean the house and cut wood.

What a change from the old pleasant life in my father's house!

Mother sent me several messages, saying, "Come back, for your uncle is very angry!" while uncle wrote, "If you do not come back I will not send you any money."

I wrote gently to mother, telling her that what I was doing was for the best, but to my uncle I replied:

"I do not come back. I do not want any money. I will work."

I stayed at that school three years, working all the time and learning English, geometry, trigonometry, solid geometry and English literature.

From thence I went on to Doshisha College, where I spent three more years. Doshisha is the great Christian college of Japan. I had done well in my studies, and there was a general feeling in the school that I ought to go to the college. A fund was collected to help me along. Messrs. Clark and Gulick subscribed, and the students generally contributed.

It was only partial help, however, and when I got to Doshisha I still worked.

Meanwhile my uncle had become reconciled and acknowledged that he was wrong in wanting me to become a soldier. He offered to send me money, but I again replied: "I don't want money. I can support myself."

One year at Doshisha I won the cash prize for mathematics, and that helped me. When I had finished the course at college I determined to go to America, but I thought that first I would return to our home and visit my mother and our family. But it was mother herself who now urged me not to delay or turn back—even that she might see me again.

So with heavy heart I bade good-by to beautiful Japan, and crossed the Pacific Ocean. I have since then heard of mother's death, and it made me very sad.

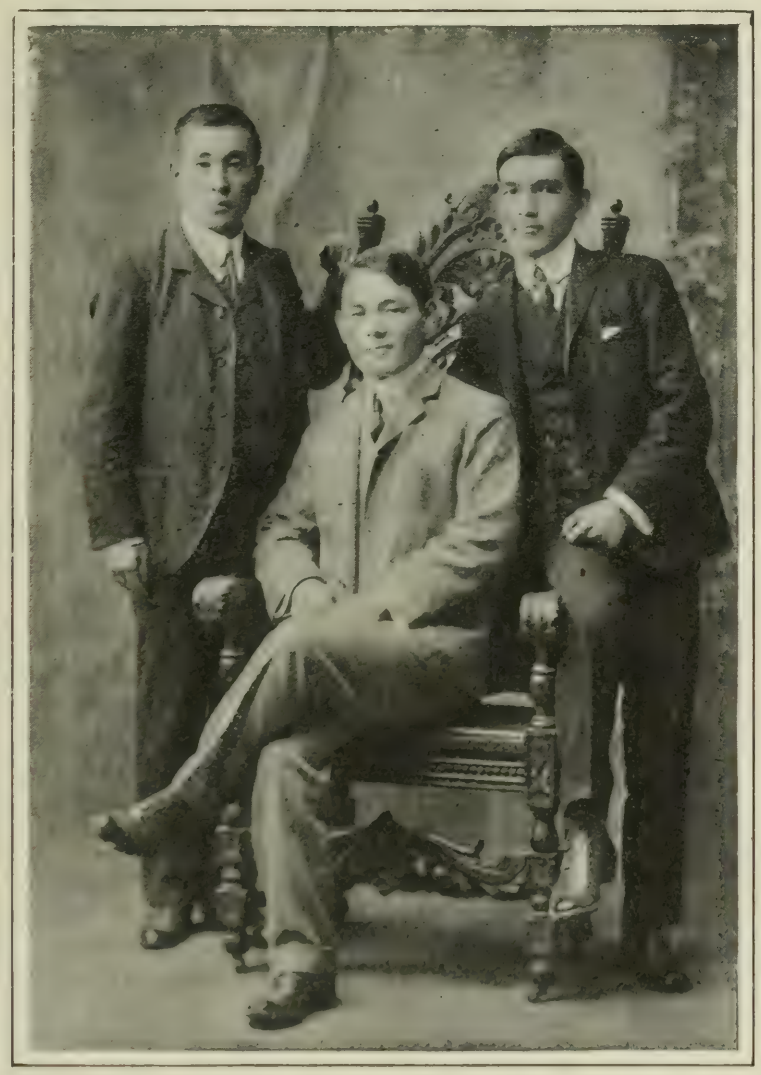
I crossed to America on one of the largest passenger ships. When we reached San Francisco our immense vessel lay alongside a great pier, and emptied passengers and cargo down the gangplanks. That was new to me. Big ships can't use the piers in Japan. They draw too much water, and are unloaded by small boats.

I thought San Francisco a very handsome city, and found in it many things to astonish me. The buildings were so high, the streets so wide—then the trolley cars shooting along so fast.

In Japan there are no sidewalks, or, perhaps, it might be better to say that all the street is sidewalk, for pedestrians walk in the center of it, dodging the jinriksha man.

The absence of the jinriksha man was another novelty. In Japan almost all locomotion is by man power. The trolley is found in a few places, but not enough to effect conditions. Here you have the great systems, and your slaves are senseless machines. That pleased me very much.

As I passed through the streets there



were all sorts of fresh surprises, especially the sight of boys and girls walking about together. A Japanese boy at home would consider it a disgrace to be seen with a girl. I think that the Japanese girls are too much kept down, and the American girls too independent. Half way between would be just right.

In my boarding house I encountered other surprises—fresh water of which I could have any quantity by simply turning a tap; and the wonderful sewer system.

Looking out of my window a little later I beheld men watering the streets. That was also new, and I especially admired the way in which it was done. If streets were to be watered in Japan men would carry the water and the sprinkling would be a toilsome and inadequate process.

Here, on the contrary, a man sits on a comfortable seat, under a shady umbrella, and smokes his pipe, while he drives a team of horses. A patent machine does all the sprinkling.

On my ride across the Continent to Monson Academy, in Massachusetts, whither I was bound, I was especially impressed by the uncultivated plains through which we passed. In Japan there is very little plain to be seen, the country is so mountainous. Here were to be seen plains that appeared endless, and no man tilling them.

Group of Japanese Students, K. Higashi Shown in Center

I knew before I crossed the Pacific Ocean that the United States was very rich, but it never was brought home to me so powerfully as by the sight of all that surplus land lying idle. It also made me think that there is a great deal of work to be done in this country.

In the vacations I found employment, sometimes in the city of New York and

at other times on the farms. Once, while working on a farm, I was sunstruck, and fell down in the field a long way from the house. I was hoeing corn at the time. How long I lay unconscious I do not know, but when I opened my eyes again I found a tramp taking care of me. He had put water on my face. When he found that I was able to rise he told me to go to the house, but I would not until I had finished my labor. Then this charitable tramp actually helped me to hoe. I fell down unconscious again, but this time some of my friends came, and with the aid of the tramp carried me to the house, where the good fellow was feasted. I never saw him again. He would not tell me his name.

From Monson Academy I went to Yale, and tried to work my way through. I was there a year and a half, studying economics in all its branches. I was attached to Divinity Hall. While at Yale I attempted to have ju-jit-su established as a department of athletics. Numbers of the students were interested in it. The president of the united athletic associations talked the matter over with me, and promised consideration, but nothing was done, so far as I know. Soon afterward I was obliged to leave college on account of financial pressure. I hope soon to return to it.

Of course, this war between Russia and my country has excited me much, as it has all the Japanese here, and sometimes I wish that I was with the soldiers, but, after all, I am only one, and I have no military training. If I get much learning I can be more useful later on.

The unpreparedness of the Russians was a surprise. It seems strange that they did not know that they were forcing us to fight. We must win. We are so much more in earnest. If the Russians are beaten from Manchuria it is to them only a trifle—the loss of an insignificant province, while for us defeat would threaten the very life of the Empire.

That, in part, explains the great earnestness of the Japanese, but besides that our soldiers are inspired by their history of 3000 years and by the traditions of uninterrupted victory over all enemies.

It is hard to make Western people understand the feeling which Japanese soldiers have for their Emperor, which makes them not only contented, but joyful, to lay down their lives for him.

In all the Western armies the best soldiers are religious, but in my country it is different. Religion and hope of a happy immortality have nothing to do with inspiring the soldiers.

Japan has taken a great deal from America, and there are still other things that she will take. One of the most important is Christianity.

The old Japanese religions are dead. Confucianism is confined to the scholars, but it is a system of morals rather than a religion. Shintoism, founded by a holy man who lived on the mountain Fusi-Yama thousands of years ago, is the oldest Japanese religion, but it is a mere mummy. The people laugh at the idols, and pelt them with balls of chewed paper as they pass by.

As to Buddhism, it has become very much corrupted. Japanese saints have been turned into Hindoo divinities, and Hindoo divinities are now Japanese saints. Buddhism is dominant, but its highest hope is death, the extinction of the individual.

So there is nothing of good in these old religions that now cumber the soil of Japan. They have no life, no force.

On the other hand, Christianity is young and full of vitality and of good promise. People who believe it are made happy.

In Japan Christianity is spreading more and more rapidly. The leading missionaries are men of great earnestness and power, and wherever one goes in the land he finds the new religion making progress, especially among the educated classes—the thinkers.

When Japan cast out Christianity before it was not because of the religion itself, but because its priests sought to exercise temporal power.

Christianity as it comes to us now has no such objection. One can be a good Christian and also a good subject of the Emperor, and so the missionaries, and especially those from our great friend America, are gladly received.

Christianity by means of its teaching will break down our class lines, which are now the great curse of Japan. They are almost as strong as Hindoo caste, and

are inconceivable to Americans, who rise or fall according to their individual powers.

In Japan there is a very strong feeling against men trying to rise above the station in which they were born, while to sink below is utterly disgraceful. Altogether, there are eight classes:

I. The princes, both Daimioe and Saimioe.

II. The kie-nien, or noblemen, feudal lords who hold their lands in consideration of military service of themselves and their retainers. From this noble class are generally selected such of the ministers as are not princes, the great officers of State, governors, generals, etc. etc.

III. The priesthood, both Shinto and Buddhist.

IV. The military or vassals of the nobility, who hold their land on very easy terms; they have merely to raise troops sufficient to furnish guards, preserve order in their neighborhoods and guard the coast. Before Japan shut herself up from the world Japanese soldiers of fortune roamed all over Asia fighting for the best paymaster. They were highly esteemed as warriors. This practice has long been forbidden.

[The four classes above mentioned are allowed to wear two swords, and the hakuma, or petticoat trousers.]

V. Inferior officials, doctors and other persons deemed respectable and not included in any of the four upper classes. These are allowed to wear the hakuma and one sword.

VI. Merchants, shopkeepers, who include among them the wealthiest men of Japan. They are much despised by those above them, and are not allowed to imitate the upper classes. The wealthy merchant may be able to purchase the indulgence of wearing a sword, but he can never hope to wear the hakuma.

VII. Small shopkeepers, mechanics, artisans and artists with the exception of those who are in any way connected with the leather trade.

VIII. Peasantry, day laborers of every kind, very degraded.

Below all these are the tanners, curriers and all who deal in leather. It is a doctrine of Shintoism that one is defiled by contact with the remains of any creature that has died. These pariahs must dwell in villages of their own. The law ignores them, they are not counted in the census, and the land on which their village stands is not measured in considering the length of the road running through it.

Japan is poor to-day, in spite of her fine climate and fertility, partly because of the great crowding on her soil, but still more because there is no such thing as the commercial spirit among her upper classes. Her nobles despise money making, and will have nothing to do with it. Commerce is far beneath them, and they will only be warriors or statesmen. The knights, too, have the same spirit, but since the war with China the beginning of a change may be seen. The importance of commerce is beginning to be recognized, and some of the knights are going into business. The old, old prejudice will gradually break down among Japanese nobles as it has recently among the noblemen of England.

Another thing that we will take from America will be some leaves of its book on treatment of women, but not all.

As I said in another place, the proper treatment of women lies half way between the way they are treated in Japan as contrasted with the way they are treated in America. With us they are oppressed, in America they are overindulged. The position of a married man in America is absurd. The law makes him responsible for his wife's maintenance, debts and offenses. If she injures any one he is punished. She owns his property, but he does not own hers. She can take anything of his and it is not stealing, but he must not take anything belonging to her. The husband must support the children, yet in case of separation or divorce the courts generally give them to the wife.

Women here constantly proclaim that they are the equals of men, yet when they separate or sue for divorce they come crying to the court, begging that the man be made to support them on the ground that otherwise they would become public charges—that is to say, they are so incapable of doing anything useful that they cannot even earn their own livings.

Man is the head of the family when there is some punishment to be inflicted.

He has all sorts of duties and responsibilities which he must fulfill or suffer. But the wife has no duty or responsibility for failure to perform which the law punishes her.

Man is responsible for the doings of his wife, and yet has no authority over her.

Foreigners laugh at the situation that American men have put themselves in by their mistaken sense of gallantry.

It is also amusing to see the result, for nowhere are men so snubbed and despised by their women as here. They have so long told the women that they are superior that the latter have come to believe the story and act accordingly.

We are not likely to make the mistake that American men have made, and we will probably confer women's rights with more conservatism and some consideration of the fact that the burdens and penalties and responsibilities must be carried, and that it is no more fair to pile them all on the man than it is to pile them all on the woman.

So I think we'll only take half of its women's rights from America.

Another thing we must have, and that quickly, is the American alphabet. Japanese books are very expensive now because our types are a mixture of Japanese and Chinese characters, and printing with us is a very tiresome process. Besides that, these characters are a bar to education. Learning wastes too much time.

These reforms that Japan will make by adopting more American ways are all in sight and certain. After them I suppose there will be others, for Japan very highly values the title conferred on her by the world, "America's aptest pupil."

NEW YORK.

"Getting Along" with People

BY KATE UPSON CLARK

"WHAT a fine fellow Percy X. is!" remarked a business man one day to a lawyer friend.

"Yes," rejoined the lawyer, "he is. But he has been with the K.'s"—naming a great corporation—"for ten years now and he is getting only $150 per month. He has a wife and three children, and, with their tastes, I fancy they have all they can do to live comfortably. He ought to be earning more, with his education and capacity."

"Why doesn't he rise faster?"

"I'll tell you. He doesn't rise and he can't rise until he learns how to get along with people. He can't manage men at all. If he tries he gets himself disliked, and he keeps them in a constant state of irritation."

A similar conversation was recently overheard between two business men. Said one: "I hear that young Paul G., only four years out of college, has been placed at the head of the T. branch of the Y. Company. I didn't know he was so smart. What is his strong point?"

"He is a great fellow to get along with people," answered the other man. "No man would, of course, be given a place of such responsibility without integrity, fair quickness and ability, and a good education. But there are scores of men who have all of those qualities and yet they do not go forward, because they cannot exercise authority. If they are given any, they either make the men under them cross and restive by petty tyrannies, or else they are too good-natured and lose the respect of the men—are imposed on by them and don't get good work out of them. It seems to be the rarest thing in the world to find young men who have dignity and keenness enough to maintain discipline, and yet can make their subordinates bear the yoke cheerfully and render good service."

A third young man was characterized

by the president of a great railroad thus: "I haven't had a chance to talk with him and find out how much he knows, but I have watched him several times as he manipulated a gang of men, and he has for weeks managed them wonderfully. We have rarely had a man in our employ who could get so much work out of a lot of men and at the same time could keep them so decently good-tempered."

In another department of life, the home, the same sort of qualities tell quite as much; for in business and in daily living self-control, reasonableness and a readiness to give up one's own way in little things are, after all, the determining elements of success. A well-to-do elderly widow was complaining of her loneliness. She was asked, "Why do you not ask one of those charming sisters of yours to live with you?"

"Oh, they are, as you say, charming," she replied, hesitatingly; "but we don't get on together—and never did."

One even hears sometimes of grown-up sons and daughters who cannot "get along" with their own fathers and mothers, when all parties are moral and law-abiding individuals. It is notorious that friends who try to live together are often, even tho they may have known each other for many years, compelled to part through incompatibility. In boarding-schools a favorite way of breaking up a too-great intimacy is to make the "smitten" ones (or, as they are sometimes known in the glossary of the modern college maiden, the "mashed" ones) room together. Also, after the ardor of courtship, it is proverbial that, unless the persons concerned possess strong characters and considerable sweetness of disposition, marital affection cools rapidly.

In short, it is undeniably a difficult thing for human beings to "get along" comfortably with each other. Those who are naturally qualified for the task are rare, and very little attention seems to be given to the matter in the training of the young, tho there is no doubt that explicit teaching and discipline would do a great deal toward increasing the general capacity of the people in this direction. It is important to impress young people with the truth that very many people have different tastes from their own—and properly—and that, in order to live harmoniously with those of alien tastes, something must be yielded on both sides. Unselfishness and reasonableness are the main traits to be developed in the very important work of making people capable of "getting along" with each other. The main happiness of life comes not from the very occasional great joys, but from the pleasant passing of the routine of daily life; and it is undoubtedly true that almost any one may so discipline himself that he can "get along" comfortably, if not joyously, with almost any other one, not absolutely vicious or wicked. Of course, one must not sacrifice dignity or self-respect, but the stickling for dignity is at the bottom of a vast deal of the difficulty about "getting along." True dignity does not have to stickle in order to support itself.

If, in addition to this delightful power of living amiably and without friction with whomsoever his lot may be cast, a young man has also executive ability and a good education, his business future is assured. But all the business ability in the world will not much profit a man unless he acquires this vital power of "getting along" with others.

Incidentally it may be remarked that the sense of humor is the great lubricant of most human friction. One must learn what to take seriously and what not to take seriously. A good laugh will untangle many a hard knot which nothing else can affect, especially in the home. Unfailing and universal courtesy is another great help to peace and joy in maintaining good relations with one's fellowmen. These people who keep their good manners for outsiders and fail to take them along when they go to business or when they return home are among the most "difficult" and "incompatible" of all. It would conduce to the cultivation of the right spirit in these matters if in every home could be hung Mrs. Sangster's beautiful poem upon this subject. A part of it, doubtless familiar to every reader of these lines, but never too often recalled, is as follows:

"If I only had known in the morning
How wearily all the day
The words unkind would haunt my mind
That I said when you went away,
I had been more careful, darling,
Nor had given you needless pain,—

For we grieve our own with look and tone
  Who may never come back again.
We have smiles for the passing stranger,
  And smiles for the some time guest,—
But oft for our own the bitter tone,
  Tho we love our own the best."

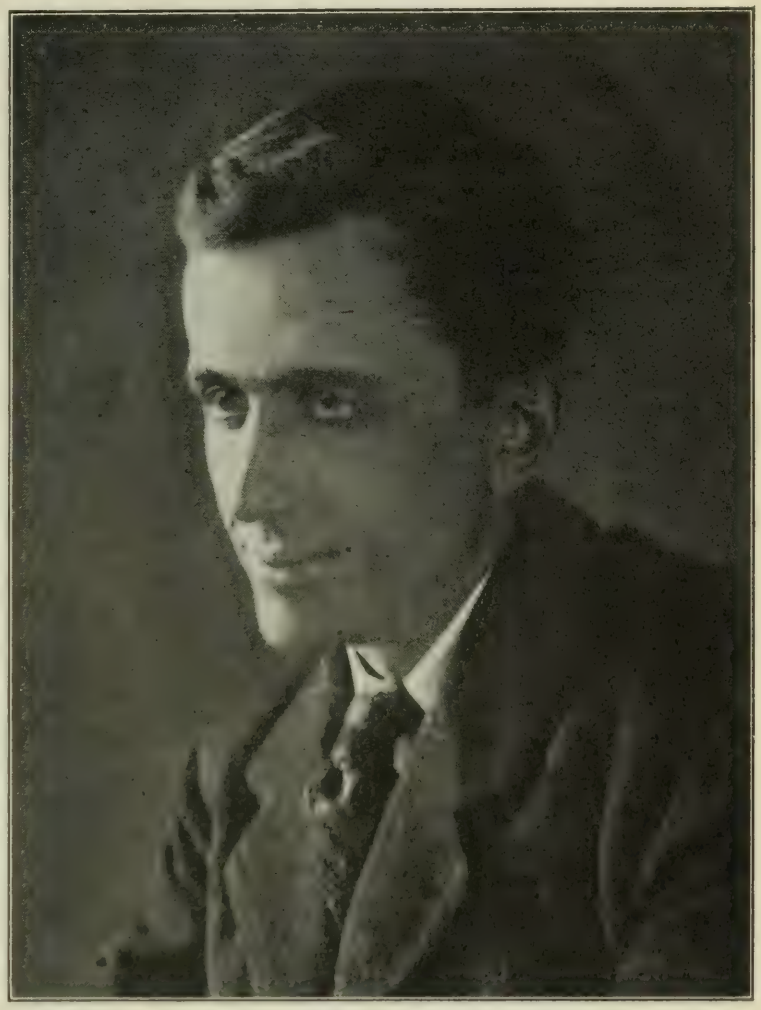
There is an unfortunate defect in those who cannot "get along" with their fellow-men in a business way, but there is something shockingly wrong with those who cannot "get along" with their very "own," whom they "love the best."

BROOKLYN, N. Y.

"Ye Have the Poor Always with You"

BY J. G. PHELPS STOKES

[Mr. Stokes is a member of the well-known Stokes family of this city. After graduating from Yale University he went through the College of Physicians and Surgeons at Columbia and then took a post-graduate course in sociology and economics at the same university. Since then he has made himself an influence in charitable and reform movements in the city and the nation. He is now one of the residents at the University Settlement.—EDITOR.]



THESE words of Jesus have been regarded by many devout and good people as being divinely phophetic and as meaning that widespread poverty, and the evils incident to it, will always be with us, and will always be productive of widespread destitution, suffering and distress. The Church, and Christian people generally, having accepted this interpretation of the Saviour's words, have bowed in resignation to what seemed an expression of divine will, and have assumed that any very far-reaching diminution of poverty was unlikely, and that the possibility of its complete or nearly complete abolition by human means was hardly worthy of consideration. Regarding widespread poverty as unavoidable, it has been customary to do what seemed practicable in the way of relieving temporarily some of the more distressing of its immediate consequences, while search has seldom been made to ascertain whether poverty may not, like disease, be usually a direct consequent and result of needlessly harmful conditions that are within the power of society to control.

It seems to have usually escaped notice that these supposed prophetic words may be regarded with equal reason as being not prophetic, but merely descriptive of conditions prevailing at the time they were uttered. Jesus used the present tense, not the future; and it is gratuitous to assume that the "Ye" referred to non-existent people of the future, or to any other persons than those directly addressed. Let us assume, tentatively, that the words were merely descriptive, and let us consider briefly some of the principal causes of poverty and the extent to which they may be subject to control. If it be found that most poverty is due to needlessly bad conditions—sanitary, social, industrial and otherwise environmental—that society can correct when it will, then the doleful picture that many of our religious instructors have drawn for us, of a world that must always be afflicted with poverty, is erroneous, needless and to be abolished; and we may substitute in its stead the more encouraging picture of a world awaking to consciousness of its power to remedy the conditions which underlie poverty and its attendant suffering.

It is evident that the immediate cause of poverty in nearly every instance is either inability or unwillingness to support one's self, or to support one's self and one's family. But to what more remote causes may this inability and thus unwillingness be due? In so far as the inability and the unwillingness are due to causes that are within the power of society to control and remove, the resultant poverty is also susceptible of prevention or cure. Poverty is perhaps unavoidable where the inability that unfits

one for self-support is due to mere accident for which no one is to blame, provided the individual has been unable, previously, to save sufficient for his maintenance while disabled; but cases with no one at fault are relatively rare. Inability and unwillingness for self-support are generally due either to fault of self or to fault of others, and the fault is generally of a kind that could be offset, if dealt with early enough, or prevented. Where the fault appears to lie in self, it is perhaps due, more often than not, less to natural depravity of the individual than to errors or defects in his early training or early associations. In either case, and in nearly every case of inability or unwillingness for self-support, defective or undeveloped personality, whether in self or in others, and of a preventable or remediable kind, can generally be found at the root of the difficulty. (The word "personality" is here used in its broadest sense, to denote the sum of all the qualities and endowments that characterize the individual.)

Sickness, lack of employment, vice and crime are frequently cited as the principal causes of poverty. It is, I think, demonstrable that in most cases of poverty each of these is due to the primary cause above mentioned—viz., defective or undeveloped personality of a preventable or premediable kind, whether in those who are in poverty or in those through whose ignorance, indifference or wrongdoing poverty has come to others. Let us consider briefly the relation of sickness to poverty. It is apparent that the temporary or permanent disabling of a wage-earner is a widespread cause, not merely of the poverty of the sick, but also of the poverty of those who had been dependent upon the sick for support, and it is becoming increasingly evident that the great majority of cases of serious illness are due to remediable conditions in the environment of the victims. To suffer and die from diseases that are now preventable has been the destiny of the vast majority of the human race, and a vast amount of poverty has been due to the same cause. Poverty thus caused is as necessary as the disease underlying it, but no more so. Disease enters the organism from without, coming usually from outside conditions that society can control if it choose. Three-fourths of the people of the United States die before they reach the age of sixty years, and a large proportion of the deaths in the few years next following are due to preventable forms of disease. Mere old age and normal wear and tear of tissues appear to be relatively small factors in inducing mortality; they seldom, if ever, are the essential causes of disease.

J. G. PHELPS STOKES

Each year sees an increase in the number of diseases traceable to remediable defects in human environments and ways of life. Unsanitary conditions of homes and workshops and public places are found to be responsible for the spread of all infectious diseases; and defective

constitutions, due directly or through inheritance to vicious or otherwise unhygienic habits, are found to be responsible for most of the remainder. Increasing knowledge of the causes of disease is gradually leading toward its elimination, and toward the prevention of so much of poverty as is now consequent upon it. It is worthy of special observation that while infectious diseases are usually readily communicable among persons whose power of resistance is low, nevertheless the large majority of the population are not under ordinary conditions susceptible to their attacks. Even where epidemics cause thousands of deaths in a single community, it is nearly always the case that the number of victims is small in proportion to the number of persons who drank the infected water or inhaled the infected air, or in other ways came in contact with the infection and escaped unharmed. The sub-normal power of resistance, which renders people abnormally susceptible to the attacks of disease, is usually traceable to unhygienic ways of living, or to an unhygienic environment, or to an inherited constitutional weakness, the latter being generally the result of carelessness, ignorance, neglect or wrongdoing in a previous generation. With ever increasing regularity the susceptibility is found traceable to human error of needless and peventable kinds. Even unhealthy environments are usually the result of human error. It is the man that makes and maintains slums and unsanitary homes and workshops, and it is defective personality, manifested in the selfish greed of citizens, that too often interposes effective barriers in the way when effort is made through legislative and other means to improve the conditions of life and labor. Needlessly bad tenement and industrial conditions are chiefly responsible for the impoverishment of the disease-resisting power of the people, and to a similar extent for the evils consequent upon disease.

As regards lack of employment as a far-reaching cause of poverty, there are at least three conspicuous causes antecedent to this: First, limited effective demand for labor; second, limited ability of the laborer to perform skillfully and well the work required; third, failure of the labor supply and the demand for labor to meet. There is ever in the community a vast surplus of unskilled men and women for whose labor there is little call, and it is usually these who constitute the majority of the very poor. When the demand for labor is less than the supply the more intelligent or more highly skilled members of the community hold all, or nearly all, of the available situations. There is no great need apparent for the less skilled or for the less efficient. Now the unskilled are unskilled either because they have lacked the ability and the desire to learn to do something well, or because they have lacked the means and the opportunity. In the one case defective or undeveloped personality (as previously defined) underlies the difficulty. In the other, where oportunity to learn is lacking, may it not be held that society is usually at fault? It is possible for society to see to it that every child shall have opportunity to learn how to be useful, and to secure such education as shall develop all that is best in character. Where society has such power and means and refrains from availing of them, may not defective or undeveloped personalities of a kind that will disappear in proportion as the public conscience becomes enlightened be ascribed to the individuals who constitute society, for their failure to do what is right in this regard? The demand for an individual's services usually increases with some degree of correspondence to the increase in his efficiency. Well-developed, well-rounded personality rarely remains long in the ranks of the "unemployed."

"It can be fairly questioned whether there is ever, in any large community, considered as a whole, an over-supply of efficient, potential producers. There is frequently an under-supply of opportunities to become efficient producers. It cannot be argued in explanation of this deficiency that there is no need for larger production. With hundreds of thousands of people underfed and underclothed, and unable to secure sufficient food or sufficient clothing, it is evident that more food and clothing could be consumed. Under our present industrial system, considerations of private profit, rather than those of public need, determine the amount of production. Perhaps at some future day the community will decide that the welfare of the mass

of the people is of more consequence than the amassment of profits by the few, and will so adjust matters that production and opportunities to produce will be more nearly in accord with the people's needs. As regards the failure of the labor supply and the demand for labor to meet, this is a difficulty that is rapidly diminishing, with improvement in transportation facilities and with the increasing organization of industry.

The poverty that is commonly ascribed to drunkenness and to the various forms of vice and crime can similarly be traced, in most instances, to remediable causes; for drunkenness and wrongdoing are but evidences of moral weakness, and in the vast majority of instances moral weakness results from defective training or from other evil influences in the environment. It seems not improbable that the inheritance of a dominating tendency to evil is far less common than is frequently suposed. It is perhaps questionable whether moral obliquity, as such, is ever inherited. To be sure, cerebral abnormalities that cause partial or complete intellectual and moral blindness occur quite often; there are to be found numerous cases of congenital structural defects that render the individual idiotic or otherwise incapable of apprehending moral truths. But among normally constructed persons it is perhaps less likely that the immoral individual has been born with immoral attributes, than that if born of immoral parents, or in a vicious community, he has entered life in an environment prejudicial to the development of moral health, and to his associations with this environment owes the trend of his character. The deficiencies in morality which underlie so much poverty could probably be forestalled, in most cases, by suitable preventive measures, chiefly by removing unfavorable influences from the environment, and by substituting other influences—educational, social, recreational—more conducive to moral health. Where moral deficiency underlies poverty in crowded tenement districts, its further influence upon the development of poverty can be in considerable measure offset by improving the environmental conditions; for instance, by the condemnation of the worst areas and the creation of playgrounds and small parks, by the improvement of tenement property itself, by providing larger opportunities for wholesome recreation and for wholesome social relations, and, above all, by so modifying our educational and industrial systems that each individual shall have larger opportunity not merely for the acquirement of knowledge and skill, but also for the development of all that is best in body and character and soul.

Obviously, indulgence in any form of vice is especially reprehensible in districts where enjoyments of clean and wholesome kinds can as easily be had. But it often happens that opportunities for clean and wholesome enjoyment are few and far between. It is natural for people to desire recreation and pleasure. Some degree of both is probably essential to bodily and moral health. Human nature is such that nearly every one feels the need of recreation and amusement. Where opportunities for the enjoyment of decent pleasures cannot be found, indecent pleasures will be had. Drunkenness and other kinds of vice will never be greatly diminished until opportunities for wholesome recreation and enjoyment become more widely available.

The direction of desire is largely determined by suggestive influences of the environment. Where prevalent suggestive influences are bad, whether in tenements, or in streets or elsewhere, the frequent development of wrongful habits is but a natural consequence. If we would prevent the development of vice and crime we must better the conditions which induce them.

Even in the present teaching of our schools there are elements which tend to the perpetuation of poverty. The goal ever before the youthful mind is *personal* success, or, as we say, the making of a career. The constant encouragement given to personal ambition, for personal triumph and personal reward, tends subtly to the development of selfish propensities which lead the individual to disregard or subordinate the interests of others in the furtherance of personal ends. The constant encouragement given to personal ambition for personal triumph and personal reward tends to develop a desire similar to that possessed by the criminal offender, who, in seeking his personal gratification, gives no proper regard or consideration to the relation of

his acts or of his course to the welfare of others or to the welfare of the community. The development of interest in one another is perhaps as important as the development of interest in self, if the greed and injustice which underlie so much of poverty are to be prevented, and if justice and fair dealing are to prevail. The perpetuation of bad and insanitary environments and the consequent development of defective constitutions, and the development of the human selfishness and indifference that are responsible for both, could be prevented in large measure by the development through school influences and otherwise of social instincts and of regard on the part of each for his fellow, and by proper social co-operation in support of remedial sanitary and industrial measures, and of measures designed to eliminate from our midst such influences as tend to make the individual self-centered and excessively self-seeking.

The human organism, like every other, grows by the exercise of inherent creative faculties, but the direction of the growth, and whether for better or worse, often depends largely upon the nature and character of outside influences in the environment in which the growth takes place. The underlying creative activity never remains long uninfluenced by its environment. There is constant development in one direction or another; in the case of the human being, the development is toward health or ill-health, toward morality and social usefulness or toward selfishness and wrongdoing. It is possible for society to determine under what general conditions of environment the development of the individual shall proceed.

With the wider awakening of the social conscience the conditions which lead to poverty are being lessened and removed. Beneficial changes in Federal and State laws and in municipal and other ordinances, resulting from the wider apprehension of social and industrial evils, are being made on every side. Factories and workshops are being better planned, better constructed, better ventilated and better equipped with regard to the welfare of the employees, sweatshops are disappearing, hours of labor are being reduced, the purchasing power of the average wage is increasing (despite occasional statements to the contrary), tenement homes are being freed from many unsanitary and demoralizing features, child labor and its attendant evils are rapidly diminishing, better and broader educational facilities are being provided, and far better opportunities for healthful and wholesome recreation. The bearing of these improvements upon the social welfare, considered as a whole, is too often underestimated. Usually the end sought in any work of betterment has been the advantage of those most immediately concerned, but a far larger result is accomplished. Not merely is the lot of the present day worker improving, but standards are being so raised that future generations will enter life under conditions less prejudicial to health and character.

With the disappearance of so much poverty as is due to needless and remediable causes, such as have been suggested, but little will remain. In the last analysis nearly all poverty is due to the ignorance, indifference, weakness or neglect of those in whose power it is to better the conditions underlying it. Proper education, intellectual, physical and moral, and wider development of the social nature and of the spirit of justice and fairness, will lead to unwillingness on the part of the people to permit the continuance of needlessly bad conditions prejudicial to the welfare of others. It is often considered that the highest welfare of the individual should be the goal for which individuals should strive, but it is as often overlooked that neither spiritual welfare nor lasting happiness can be secured by selfishly seeking it. The highest welfare possible to the individual, like the greatest happiness, can only be attained through unselfish useful service. The more unselfish and useful the service and the higher the motive which prompts it the higher is the welfare and the more enduring the happiness that results. In proportion as individuals become unwilling to advance personal or group ends by means destructive or preventive of the welfare of others, and in proportion as they seek, as a common goal, the welfare of society as a whole, the greatest of all obstacles to the attainment of universal individual welfare will be removed and, in the same proportion, poverty will vanish.

New York City.

Literature

A Ladder of Swords

After all, the best commentary upon the excellence of Sir Walter Scott's historical novels is the frequent failures of modern authors who undertake this class of fiction. Now, Sir Gilbert Parker, who needed no history as a guide book for his genius, has written one * and dashed the fame he earned three years ago with his Canadian story, "The Right of Way."

The scenes are laid during the reign of Queen Elizabeth, first, upon the Isle of Jersey, later, at the English court. Two Huguenot lovers seek refuge from persecution in France on the coast of Jersey, and so long as they remain among the simple fisher folk there the story runs the usual epic course of true love. But, for the sake of contrast, they are thrust into the glare of court life, where love is a feverish passion, inconstant and corrupted by intrigues. Leicester is the stage villain here, and the Queen a woman with the instincts of a coquette and the hard heart of a sovereign who played with the destinies of men and kingdoms. Leicester is the peril, Elizabeth the dubious succor, and the lovers poor tempest tossed creatures of fate. They are really lost sight of as actors in the drama from this point. Henceforth they do nothing for themselves, they are simply the pawns in a royal game. And if it was Sir Gilbert's purpose to write out a clever interpretation of the players, Elizabeth and Leicester, he might have left out the Huguenot lovers and the Jersey scenery, and that other ingenious character, Lemprière of Rozel, for they are not vitally connected with the tale after the great figures appear.

This, indeed, is the peril of the historical novelist. When he brings an important character upon the stage (dependent not so much upon his genius as upon history for the impression made upon the reader's mind) his own creations disappear. One can see they were used merely as a bait to draw some magnificent shades of history upon the scene. After that they are simply lay figures. So, in this story, the whole situation is changed and adapted to the character of Elizabeth. She fills the stage to the exclusion of those who were supposed to play the star *rôles* of hero and heroine. Charles Major in his novel, "Dorothy Vernon of Haddon Hall," managed the appearance of the great Queen better by limiting her to an aparently accidental passage at the critical moment through the scene of his story. There is room for such characters only in history. They are miniatured in fiction, and even then they obscure every other character introduced.

Copyright, 1904, by Harper & Brothers
From "A LADDER OF SWORDS"—Reduced

The question Sir Gilbert's critics and admirers must decide is whether the canons of literary art justify an author

in progressing from one set of characters to another in the course of one story, and, having progressed, whether he has given an adequate interpretation of Elizabeth or Leicester. If so, both are less able and less significant than history represents them to be.

The Johannine Problem

FEW more important books have appeared on the Johannine Problem than the two which come almost simultaneously from opposite sides of the British Channel as the work of authors, one of whom is principal of the Unitarian College at Oxford, the other a Roman Catholic abbé. And the books are curiously fitted to supplement one another. Each the work of a thorough scholar, fully master of the voluminous literature of the subject in English, French, German and Dutch, each broadminded and judicial in tone, their conclusions are as nearly contradictory as a really unbiased treatment would seem to allow. It seems also remarkable that it should be the Unitarian who upholds the traditional view of the authorship, and the Roman Catholic who regards it as irrevocably disproved. But aside from this difference in results, the method of treatment makes the one book a good supplement to the other; for Principal Drummond* has given nearly all his attention to the external evidence, the three chapters on the use of the Gospel by Justin Martyr (pp. 84-162), Papias (pp. 194-254) and Basilides (pp. 296-331) occupying by themselves alone nearly one-half the entire volume. The first and third of these chapters having been published so long ago as 1875-1877 and 1892, respectively, the author's verdict was, of course, no surprise to the scholarly world; yet if any could resist the impression of candor and impartiality produced already in the preface by the author's references of esteem to his two eminent teachers, J. J. Taylor and James Martineau (both vigorous opponents of the Johannine authorship), the subsequent treatment would convince him by its thoroughness, suspense of judgment and fair statement of opposing arguments.

But it must be admitted that there is here great lack of proportion. The really decisive evidence is generally admitted to be the internal; and not only does this appear somewhat slighted in the relatively brief space of 64 pages, but one finds it hard to resist an impression that the author has given away his whole case from the very start.

It is not the mere fact that the Gospel is acknowledged to be "not history in the ordinary sense" (p. 64), the scene of the raising of Lazarus in particular being admitted to be "more like a land of dreams than of waking reality," tho the ordinary Christian will have small thanks for the critic who vindicates the apostolic authorship at the expense of the historicity. The more serious objection will be that this theory of a Galilean apostle substituting haggadic idealizing for the actual memory of Jesus the Teacher, companion and friend, taxes credulity to the breaking point, even among those best acquainted with Philo and the Jewish schools.

A juster sense of proportion is evinced by Loisy.† Here the running commentary of 810 pages is preceded by an introduction of 150 in small type, discussing both external and internal evidence with breadth and thoroughness, while the standpoint leaves nothing to be desired in regard to reverent religious feeling. The Abbé Loisy has the courage of his faith. Heartily and intelligently believing in the principle of progressive revelation through the Church, the discovery of a post-apostolic origin and unhistorical character for the Fourth Gospel has no terrors. He interprets it in accordance with his well founded, carefully and clearly stated critical results. We may well believe that the progress of scientific criticism, or discovery, may avail to vindicate for this Gospel a larger element of actual historical tradition underlying its unquestionably subjective treatment than Loisy or even Drummond is disposed to admit. The type thus far stands alone, and must be admitted to represent not the author's memory, but his interpretation of Jesus's life. On this point both critics are agreed. But there is room for a third position, the develop-

† LE QUATRIÈME EVANGILE. *By A. Loisy.* Picard et Fils, Paris.

ment, through Paulinism, of a type of gospel teaching, of which the Fourth Gospel is the ultimate product rather than the isolated creation of a single incomparable genius, extravagantly disregardful of historic fact. But if M. Loisy ever admits a larger element of historical tradition and development for the Fourth Gospel it will not be due to the *brutum fulmen* of his ecclesiastical superiors, nor to the placing of his books upon the Index.

John Addington Symonds*

THIS new edition of the Life of John Addington Symonds brings into fresh notice a man of letters who is singularly interesting in his personality, tho he missed the mark of greatness in his work. The book is essentially an autobiography, with only such editorial links supplied as psychological or chronological coherence seems to dictate, and is the story of a lifelong struggle of a brave spirit against physical weakness and mental unrest. On the surface Symonds's nature strikes one as a bundle of paradoxes. He was known everywhere as a sparkling conversationalist and a genial and helpful companion, tho his quiet hours were filled with gloomy questionings as to the meaning and value of life and his diary makes us feel that in his maturer years he never once felt the sensation of joy. Strangest of all—if any of these things are strange—tho he had been surrounded with every mark of culture from his earliest infancy, was keenly alive to beauty in all its subtler artistic forms, and from a boy was immersed in literature and literary pursuits, he panted hour by hour for the real arena of life, from which disease held him back, and in the midst of his labors cried out against being penned up in what he called "a cage of archeology and literary picture making."

It was natural that a mind so active as Symonds's should, when forced back upon itself for occupation, grow overanalytic and introspective. And yet there is a resolute thoroughness in the way he sifts to the bottom the facts of life—himself included—that wins our respect and saves him at last from any charge of morbid triviality. Indeed, his self-criticism is so insistent and uncompromising as to make it quite unnecessary to ask his enemies the worst of him. On the moral side he arraigns himself severely for his lack of will power, and yet it is surely more just to measure the vigor of his will by what he resisted than by what he was able to achieve; for acute suffering drained his vitality almost constantly with the mere duty of endurance, and there was little strength left for positive endeavor.

Of his intellectual endowment he was equally as critical as of the moral, and declared sadly that he knew nothing thoroughly because he could learn nothing systematically, that his mental furniture was "a vague, ill-digested, inaccurate mass, rich in possibilities and poor in solid stuff." And yet he adds characteristically that he had forced himself to accuracy in his writing by continuous drudgery of preparation. He had had his ambitions, from a boy, if literature were to be his life work, to prove himself an artist in the true creative sense; but when he came to sound his own depths for the choice, he told himself plainly that he could not rise higher than the ranks of the *vulgariseurs*, those popular dispensers of culture who could only adapt and hand on what others had created or accomplished.

On the whole, such a book cannot fail to leave us with an added sense of the mystery of life. Certainly it makes us re-echo Symonds's own prayer for himself, "God make it better somewhere else."

American Tariff Controversies

THIS account of tariff controversies in the United States * during the last century may be looked upon as partly history and partly polemics. It is a history of the most persistent issue in American politics, the struggle between protection and what has been conventionally, tho incorrectly, called free-trade; and it is

* JOHN ADDINGTON SYMONDS. *A Biography. Compiled from his Papers and Correspondence. By Horatio F. Brown.* Second edition. London: Smith, Elder & Co. New York: Charles Scribner's Sons. $2.00.

* AMERICAN TARIFF CONTROVERSIES IN THE NINETEENTH CENTURY. *By Edward Stanwood.* In two volumes. Boston: Houghton, Mifflin & Co. $5.00.

also a defense of the protective system. Mr. Stanwood claims that he has tried to be impartial in the history, and as just in the defense as his conviction of the rightness of protection will allow him to be, and a careful perusal of his book shows that he has given abundant material to the advocates of both systems without unduly emphasizing his own views or intruding unjustifiable party prejudices. There is no doubt that the value of the book is enhanced by the subordination of the polemical to the historical part; for in a discussion so highly contentious in its nature it is far more difficult to get at the facts and record them fairly than it is to interpret them in harmony with a theory. In no part of the discussion, except perhaps in defending the tariff of 1824, is there an undue insistence upon the exclusive agency of protection in producing a beneficial change; while the treatment of the various so-called free-trade tariffs is marked by an evident desire to avoid imputing to them consequences entirely independent of their operation.

The century-long controversy has been between those who contended and those who denied that Congress has power to impose customs duties for other purposes than revenue. These may be called respectively the parties of liberal and of strict fiscal construction of the Constitution, and it is hardly necessary to say that the former permitted a more elastic interpretation of economic duties and opportunities. These were gradually unfolded in the development of the protective idea, which, under Washington, meant simply making the country self-sustaining in the production of things necessary in a state of war. Under the leadership of Hamilton the idea was enlarged to encourage diversification of industries and the creation of a domestic market for agricultural products, which should not be permitted to depend upon a precarious foreign demand; under Clay the patriotic demand for an "American system" of protected manufacturing was still further realized, while under the McKinley and Dingley tariffs the farmer was admitted to the privileges which had been enjoyed by the manufacturer. On the opposite side one main contention, that of a tariff for revenue, animated the opponents of protection. Mr. Stanwood devotes a considerable portion of his volumes to an account of the complication of the tariff controversy with slavery, between 1828 and 1860, and with free silver in the last decade of the nineteenth century. The result is that a large part of the tariff question was not debated upon its economic merits, but was a maneuvering ground for the political parties and discontented elements within them; so that, for example, Clay's compromise tariff of 1833 was an economic makeshift conceived in political necessity, while the Walker tariff of 1845 expressed the views of a doctrinaire, and the Wilson-Gorman measure of 1894 embodied the victory of protectionist Democratic senators in the North over the rank and file of their party in the West and South. The modification of economic tendencies by political cross currents is clearly brought out, and the contribution of different factors in the settlement of various tariffs accurately estimated.

To us the most practical bearing of Mr. Stanwood's book upon tariff discussions is its relation to the so-called economic maxims of the orthodox school of English political economy. He points out that those maxims have always been assumed as true by one of our great political parties, and that the campaign arguments and fiscal state papers of that party have been merely transcripts, *mutatis mutandis*, of English free-trade doctrine. But if he has been able to establish, as some will undoubtedly think he has established, that American experience under protection flatly contradicts the maxims by which Cobden and his school have imposed an economic creed upon the great majority of the British electorate, he will have gone far to relegate that school to a position of temporary expediency. He maintains that protection has not ruined the foreign trade, that it is not true that a nation will not or cannot buy from another country which maintains a high tariff against its productions, that protection does not shut out our goods from foreign markets, and that the increase of American manufactured exports during the past thirty years necessarily contradicts one or the other of two free-trade maxims—namely, that a protective tariff results in

an addition of the foreign price and the import duty to make up the home price; or, that men buy in the cheapest market. Striking facts are given in support of these contentions, and they will challenge attention in any serious discussion of the subject. We can hardly doubt that the history and argument presented in these volumes will be deemed of permanent value, both in this country and in England.

Pioneering in Central Africa. By Samuel P. Verner. Richmond, Va.: Presbyterian Committee of Publication. $2.00.

When we remember that the United States has not had the incentive to Foreign Missions that Great Britain has had in vast colonial possessions, the growth of the Foreign Missionary spirit in this country cannot be regarded as other than phenomenal. Taking the last year of the eighteenth century as the starting point, in four years over a century. Foreign Missions have developed to such an extent that there is now scarcely a country, civilized, semi-civilized or pagan, where the recognized religion is non-Protestant or heathen, where American missionaries are not to be found devoting body and soul to the spread of the teachings of Christ. If there should be any one who for one moment thinks that devotion to this service calls for any sacrifice of the manliness of the American, let him read "Pioneering in Central Africa." It is the story of the work of the Rev. Samuel Phillips Verner as a missionary in the Kongo Free State, during the years 1896-98, at a station on the Kasai River, an important tributary of the Kongo. This young Southerner, after graduating from the State University of South Carolina and spending a short time in the carpenter shops of the Southern Railway at Columbia, offered his services to the Southern Presbyterian Church to take the place of a minister at Luebo, who was to come home on sick leave. There is no need to recount Mr. Verner's story. No one who takes up the book will refrain from learning it, for it is rarely that such a record of missionary work finds its way into the hands of the general reader. Mr. Verner has the literary instinct and, having a tale to tell, can tell it in bright and genial style, never forgetting his high mission, and never losing sight of human interest. The volume abounds in incident and observation, and much real information can be derived from it concerning the habits of the native population and their relations to the government of the State. Occasionally there are echoes of conditions such as might easily lead to mal-administration, of which serious charges have lately been made against the Kongo Free State. Especially is this the case where Mr. Verner relates how a body of native troops, without any discipline and accompanied by a rabble of camp-followers of the most vicious class, were sent to Ndombe to collect tribute. It will be readily seen that if the missionary had not been the strong and wise man that he evidently is an outrage would have taken place. There is no doubt that the slave trade is in operation also, so that the conditions are more likely to be truthfully represented by the foreign consuls' reports than by the denials of King Leopold of Belgium. In every way the volume is an interesting one, but perhaps the highest praise that can be given to it is to say that it is a pity that we have not more missionary records like this, instructive in temporal matters and encouraging in spiritual.

James Oglethorpe, Founder of Georgia. By Harriet C. Cooper. D. Appleton & Co. $1.00.

Fortunate is the biographer who has the privilege of delineating a true hero, and equally happy is the hero who has so judicious a biographer. James Oglethorpe was earnest, disinterested, farsighted, generous, brave, wise and a philanthropist in a true sense. In his ninety-five years of vigorous life he did much, suffered much and enjoyed much in various lines, withholding nothing when self-sacrifice was essential to the success of whaever cause he had at heart, and the infant colony which he planted and nursed owed everything to his wise labors. Yet, like most good and great men, he suffered much from detractors, jealous of the measure of success which he had achieved. He belonged by birth to the ancient landholders of England, and

had inherited the sense of moral and material responsibility for the welfare of the classes beneath his own social grade which is one of the best features of the best men of this class. As a lover of mankind he wished to open homes in the New World which should provide for the overflow of the Old, and as a patriot he was open-eyed to the benefits which would accrue to England by planting colonies composed of men capable of becoming valuable citizens, self-reliant, industrious, intelligent. He did not refuse to take men from behind prison walls, but—himself one of the earliest of England's noble prison-reformers—he was well aware that there were but too many prisoners who had become such from misfortune rather than from deeds deserving of punishment. Knowing this he accepted for his Georgian Colony "such poor prisoners as were worthy, carefully investigating character, circumstances and antecedents," and suffering none to go who "had the character of lazy or immoral men." Hence, Oglethorpe's Georgian Colony became noted as one of the best ever planted on our shores. At a day when few persons thought ill of negro slavery, Oglethorpe refused to allow it to take root in his colony, and in all his dealings with the Indians he was ever just and kind as well as firm and wise.

The Life and Times of Thomas Smith, 1745-1809, a Pennsylvania Member of the Continental Congress. By Burton Alva Konkle. Philadelphia: Campion & Co. $4.00.

This is a valuable addition to those best of all books, good biographies. Thomas Smith, born a Scotchman, becomes an American and one of the leading figures in his State in the stirring times when it was making and when it was fighting for independence. He was a rough "type," with a caustic pen, a rasping tongue and a good heart. Here is his portrait drawn by Horace Binney, who saw him in 1800 on the day when he came to dine with Mr. Rawle at Harley:

"It was a day in July, excessively hot, and the Ridge Road dusty to suffocation. I went with some of my young friends in a hackney coach, and we overtook Judge Smith on the road. He was on horseback, in enormous boots that came above his knees like a fisherman's, a cocked hat exposing his whole face to the fiery sun, and a full cloth dress which had been black probably when he set out, but when we saw him was most dirty drab. Some fifteen minutes after our arrival he came into the saloon where the company had assembled. His hat was then in his hand, but on his head was a mass of paste made by the powder and pomatum, a part of which had run down in white streams upon his face, as red in all the unplastered parts as a boiled lobster, and his immense boots and spurs, broad skirted coat, and the rest of the appearance I have described, made him the most extraordinary figure for a summer dinner that I have ever seen."

Nevertheless Smith was a large man, moving among large men and doing large things, which are interestingly chronicled here.

The Prevention of Consumption. By Alfred Hillier, M.D., C.M., B.A., Secretary of the National Association for the Prevention of Consumption, London. Revised by Professor R. Koch. With illustrations. New York: Longmans, Green & Co.

The Self-Cure of Consumption Without Medicine. With a chapter on the Prevention of Consumption and Other Diseases. By Charles H. Stanley Davis, M.D., Ph.D. New York: E. B. Treat & Co. 75 cents.

These two little volumes have the last word that is to be said on the important subjects of the prevention and cure of consumption. In his preface to the first book Dr. Hillier says tuberculosis "may be cured, can be avoided and ought to be prevented." That is the position occupied at the present moment by practically all the intelligent physicians of the world. No scientific medical man now believes that heredity is at all an important factor in tuberculosis; on the contrary, genuine examples of tuberculous heredity are considered to be medical curiosities. Certainly no one inherits the disease in the old sense, in which it was considered that in certain families tuberculosis was practically inevitable and its issue sure to be fatal within a few years after its development. The matter of prevention is simple enough. The one thing necessary is the avoidance of infectious material. The manifestations in children's necks, which used to be considered due to an hereditary taint, and were spoken of as scrofulous, are now known to be direct infection through the

mouth, either by way of the tonsils or not infrequently through carious teeth. If the present sufferers from tuberculosis could be made to understand the absolute necessity for their never permitting any infectious material to escape from their persons without seeing to its disinfection that would be the end of tuberculosis. Such is the dictum of the best known authority on tuberculosis in the world, Professor Koch, of Berlin. Once tuberculosis is contracted a fatal issue is by no means inevitable. Medicines, however, accomplish very little for the disease, except to alleviate its symptoms when it has unfortunately been allowed to develop to a more or less incurable stage. If taken early fresh air and food will almost invariably cure it. By fresh air is meant outdoor life for at least twelve hours a day and open windows at night, no matter how cold the outer air may be. Tent life is the ideal. The dietary must consist mainly of nitrogenous material. Eggs and milk are the most suitable special articles. The fats by saving nitrogenous waste are important factors. When an abundance of outdoor air is taken, quantities of food that would otherwise make patients ill may be consumed not only with impunity, but actually with rapid gain and weight and a sense of well-being that soon encourages the patient into that confident autosuggestion of cure that is so sure to bring with it restoration to health. This is the modern solution of the mystery of the treatment of consumption.

Success Among Nations. By Emil Reich, LL D. New York: Harper & Brothers. $2.00.

The author in this interesting work has made an earnest endeavor to analyze psychologically the human forces which inherent in some nations have led to success either in a material or in an intellectual sense. To the reader with historical inclinations or with mental adaptiveness toward sociological, political or economical problems the trend of research in this work for underlying principles that have brought certain nations out on top, while their absence has prevented other nations from holding their own in the battle of historic existence, will awaken pleasant and perhaps useful philosophical reveries. It cannot be expected that to every one reading this book reflectively the same conclusions will present themselves as those arrived at by the author. His researches throughout history afford indisputable facts as to success among certain nations viewed from achievements that have been material, to which no exception with the writer is admissible. When, however, we reach the chapters entitled "Religious Success," we instinctively feel that the author is upon ground to be trodden gingerly. Full assent to his conclusions here will be infrequent, altho the style is undeniably clever and scholarly. The volume ends with "Success in America." As is anticipated by any American taking up this book, we, according to the author, have of all nations the greatest chance of success, economic or material. In the event of the Far East undergoing a process of *Europeanization* (the word grates somewhat; *modernization* would seem to be a more appropriate epithet), it is accurately pointed out that America will be the very economic center of the globe. Intellectually Dr. Reich accords to us a success that will not attain the highest plane, as he ascribes the greatest intellectual progress to intense personality not to be evolved in a country given over to absolute democracy. Few will agree with the author that our American women have by overmentalization weakened their powers for good. All, however, will concur with Dr. Reich in his forecast that the "path of America is strewn with stumbling blocks, which it will require her utmost ingenuity to circumvent or to surmount." Some of the issues in the present and in past political campaigns forcibly illustrate this truth.

A Daughter of Dale. By Emerson Gifford Taylor. New York: The Century Co.

Apparently *D* is a typographical error for "Y," but it would be unfair to think that in Yale or in any other American college the evils of arid scholarship are as great as the author paints them. The aim of the story is to show how the adoration of the humanities dehumanizes their devotees; how the strife for literary honors generates the passions which lead

to arson, murder, suicide and insanity. It shows vividly the weakness of the monastic college in creating a false antagonism between learning and life. Paul Gardiner, a young man who by character, tastes and circumstances should become a farmer, goes to "Dale," instead of to an agricultural college, and is drawn by the example of Professor Hare and the persuasion of his granddaughter Barbara to devote his life to philological research. He deceives himself for a time into the belief that to determine the date of the birth of an obscure author or of the first production of a deservedly forgotten play is the highest and noblest work a man can accomplish. But again the woman leads him on, out of the barrens of aimless learning, and shows him that it is better to live than to make a career. The author should write a sequel on how to be scholarly, tho married. Is it not possible that Paul can give quite sufficient attention to his own culture without neglecting that of his cabbages? The most original theme of the book is that showing of the brutalizing influences of privations and overwork on the "poor but worthy student." The advantages of working one's way through college are so often pictured that it is a good thing to have the bad effect of such a life brought to notice, even tho exaggerated as here.

Scripture Doctrine. By J. J. Summerbell. With Contributions by Brethren Named in Connection with their Writings. Dayton, Ohio: Christian Publishing Association. $1.00.

This volume gives in compact and excellent way what in the view of the authors, Dr. Summerbell, Dr. J. B. Weston and ten other writers, are the teachings of Scripture doctrine usually held in the Christian Connection. This body must not be confounded with the Disciples, with whom there has been some little talk of late of their union, and the two bodies are often confused under the designation of "Christian." Their principles may be characterized in a few words; that they have "no creed but the Bible," that they "allow individual interpretation to all the followers of Jesus," that they have "no leader but Christ," accept "no name but *Christian*," and have "no test of fellowship but Christian character," and that they "fellowship all Christians." The especially characteristic portion of the volume is that which has to do with the name, the argument for which we do not wholly accept. It appears to be based in great part upon Acts 11:26; "The disciples were called Christians first at Antioch;" the word "called" in Greek being *chrematizo*, which Dr. Summerbell translates "designated of God," as an oracle "chrematizes" its answer to an inquirer. He holds that throughout the Old Testament and the New the word is used always for authoritative command. Herein he contradicts all the dictionaries and the familiar use of the word in Philo, Josephus, and the Christian Fathers, who speak of Antiochus as being *chrematized* (called) *Epiphanes*, and of James as *chrematized* (called) *brother of our Lord*. We make no objection to the other admirable arguments from its general appropriateness of the name *Christian* as against denominational designations.

Chopin. By J. Cuthbert Hadden. London: J. M. Dent & Co. New York: E. P. Dutton & Co. $1.25.

The qualifications of Mr. Hadden for writing a life of Chopin are no more apparent now that he has done it than was the need for another book about that much discussed composer. But the Messrs. Dent's pretty little series of "The Master Musicians" would have been incomplete without the inclusion of a volume devoted to the famous Pole, and in its author Frederick J. Crowest, who edits the series, has undoubtedly found a man after his own heart. Mr. Hadden has followed, in the main, such good models as Niecks, Hadow and Huneker, but he nowhere improves upon those models. Practically everything in his book worth saying has been better said before. His own opinions are wonderful things. In setting them forth he is comical and verbose, overloading his pages with quotations of familiar phrases (not always apropos of the subject), stock expressions and "tags" of the cheapest kind, fatuous explanations of Chopin's little jokes, and much moralizing in inane platitudes.

Literary Notes

THE concluding parts of their superbly illustrated poultry book have been announced by Doubleday, Page & Co.

....Ella Wheeler Wilcox will publish this fall, through L. C. Page & Co., a characteristic volume entitled "A Woman of the World."

....Mr. Bliss Carman has just issued, through L. C. Page & Co., a book entitled "The Friendship of Art," a second book of prose essays.

....A new volume by Cyrus Townsend Brady, published through the Scribner's, is entitled "A Midshipman in the Pacific, the Story of a Kidnapped American Boy."

....A holiday edition of Richard Harding Davis's famous dog story, "The Bar Sinister," is announced by the Scribner's for the holidays. It is beautifully illustrated with color plates.

....L. S. Dickey & Co., of Chicago, announce for early publication a book entitled "Free America." It maintains the rights of the individual, and advocates healthy competition.

....The publishers of "The Confessions of a Club Woman" have succeeded in arousing some interest in the anonymous author of this volume through the publication of a composite portrait.

....The Arthur H. Clark Company, of Cleveland, Ohio, are publishing an exhaustive work in fifty-five volumes on the Philippine Islands. The edition is limited to one thousand numbered sets.

....Some very beautiful calendars and selected quotations for 1905, printed in black and white and hand tinted, are being issued by Hugh & Margaret Eaton, of Brooklyn. Some of these are neatly framed with transparent celluloid instead of glass as a protective front. These are a decided novelty.

....To the very numerous editions of the Bible which have been published from time to time, since the days of Guttenberg, the latest addition is called the "Emphasized Bible." One of the features of this publication is a new translation, designed to insure perspicuity of text, which is emphasized throughout after the idioms of the Hebrew and Greek tongues.

....A. J. Holman & Co., of Philadelphia, have just issued an unique life of Christ for little children, the pictorial features of which include illustrations from the old and new masters, and illuminations based upon early manuscripts, missals and Books of Hours of the fifteenth century. The Scriptural story is made attractive to the little ones by the introduction of easily memorized versicles.

Pebbles

Downton: "How did Binkers, the rich architect, become so poor?" *Upton:* "He built a house for himself."—*New York Weekly.*

....CIVILIZATION PROGRESSES.—There are now but few towns in Ohio where deaths are referred to as demises.—*Cincinnati Commercial-Tribune.*

....*Brown:* "I hear you have a cow?" *Robinson:* "Yes." *Brown:* "Does she give milk?" *Robinson:* "No! We have to take it from her."—*Country Life in America.*

....*Smith:* "I understand that President Roosevelt has recently received a letter from the black hand." *Jones:* "You don't say so! From the Mafia?" *Smith:* "No. From Booker T. Washington."—*The Sunny South.*

....For every fifteen minutes that a certain Atchison girl's callers stay after 10 o'clock she has to forfeit 50 cents of her weekly allowance. One young man cost her $1.50 in one evening recently, and she gets only $1.75 a week.—*Atchison Globe.*

MARRIED.

SCHEIKOWITCZ—DOBRZYNSKI.—On Sunday, July 31st, in Jefferson Hall, by Rabbi M. Weinberger, of Beth Hamadrash Hagadol Anshei. Hungary; Rabbi B. Guth, of Anshei, Chenstochow, Aucher Sofer and Rabbi Aaron Dobrzynski, of Beth Hamidrash Hagadol Desefardim, Miss Henrietta Scheikowitcz to Mr. Abraham Elias Dobrzynski, both of New York City.—*Pioneer Press.*

EVERYTHING GOES IN A STRAW VOTE.—"Will you kindly tell me who is your choice for President?" asked the passenger in the check suit. "I'm taking a straw vote." "Hey?" said the slightly deaf passenger. "Well," rejoined the other, "he isn't running, but I'll count your vote, just the same." Marking down one vote for the distinguished Secretary of State, the man in the check suit passed on.—*Chicago Tribune.*

....By his presence at the opening of the "Subway Tavern," a model saloon is the promotion of temperance, the Reverend Bishop Henry C. Potter has rendered the cause of sobriety a great service. His speech on that occasion has furthermore shown this noble clergyman in his true greatness. We have repeatedly had occasion to express our high admiration for Bishop Potter for the manly stand he has taken regarding excise matters in general and the question of Sunday opening in particular. This new proof of his tolerance and liberal views must endear the reverend gentleman to the heart of every advocate of true temperance.—*The American Brewer, New York.*

Editorials

Judge Parker's Letter of Acceptance

THE strength of Judge Parker's letter lies in his argument for tariff revision and reciprocity; its weakness is found in his denunciation of evils and tendencies which are wholly imaginary, and in his curious descent at times—especially in his final appeal—to the level and the terms of a radical alarmist. The deliberate conservatism of a considerable part of his letter is sharply at variance with these shrill questions in which at last he defined the issues that are joined:

"Shall the wrongdoer be brought to bay by the people, or must justice wait upon political oligarchy?

"Shall our Government remain a Government of law, or become one of individual caprice?

"Shall we cling to the rule of the people, or shall we embrace beneficent despotism?"

These inquiries could not have been penned in the peaceful seclusion of Judge Parker's library at Esopus. They must have been suggested in the hurly-burly of the Hoffman House by partisans who were determined to inject into the letter that spice which, in their judgment, the speech of acceptance lacked.

Judge Parker must have yielded to the influence of these same dissatisfied advisers when he asserted that the people of the United States are now standing "at the parting of the ways," about to decide whether they shall follow the footsteps of their fathers "along the paths of peace, prosperity and contentment," or shall enter upon "untried paths, hitherto shunned by all," and leading into all sorts of bogs and quicksands. Does he really believe that we have now reached the fork of the roads, where one signboard, bearing the word "Parker," points to democracy preserved, while the other, marked "Roosevelt," with ominous finger points to imperialism—not the so-called imperialism which relates to the holding of colonial possessions, but real imperialism here at home, in our own domestic government? Does he believe that, if Roosevelt is elected, justice for wrongdoers "must wait upon political oligarchy," and that we shall exchange popular rule for "beneficent despotism"?

We cannot think so. If such be his belief, this sedate and conservative judge has suffered a grievous transformation by association with scatter-brained politicians.

Much that he says upon this subject and with respect to our attitude toward foreign nations is not applied directly to the President, but it is intended that such an application of it shall be inferred. Thus, we have a picture of the "determined and ambitious Executive, fired with the lust of power," usurping authority and craftily subjecting an unsuspecting people "to the rule of individual caprice." And in our foreign relations our policy should be, he says, one that condemns the appropriation of a small and weak State's territory, that forbids us to play the *rôle* of the American continental policeman, that requires us to respect each American State's right to preserve order and otherwise regulate its own internal affairs in its own way.

The intended inference is that such is not the policy of Mr. Roosevelt and Mr. Hay, and we suppose that it cannot be if it is true that the President's purpose is to establish imperial power and a "beneficent despotism" at Washington.

It is an interesting coincidence that on the day preceding the delivery of this letter to the press, 200 members of the Interparliamentary Peace Union called upon Mr. Roosevelt at the White House and informed him that on account of his labors in behalf of international peace and justice they deemed him "especially fitted" to take the initiative in convening a second peace conference at The Hague, a conference that should promote the cause of international peace not only by means of arbitration but also by establishing a kind of World Congress.

These representatives of fifteen national Parliaments, now holding their

twelfth annual session, saw in him "an earnest defender of international justice," a "friend of peace," and the Executive whose action had preserved the life of The Hague Court. And he consented to convene a second conference, whose work will be in the interest of international peace and a world-wide democracy, pointing out that our Government was now seeking to procure new arbitration treaties, and saying that we should "strive to secure among the nations of the earth, as among the individuals of each nation, a just sense of responsibility in each toward others, and a just recognition in each of the rights of others."

How were these devoted friends of peace to know that Mr. Roosevelt was a wolf in sheep's clothing, an ambitious Executive fired with the lust of power, robbing weak nations of their territory, assuming the *rôle* of continental policeman, imposing upon our people the rule of individual caprice, plotting the substitution of imperialism for democracy in his country, and intending to set up a "beneficent despotism" after the November elections? But Judge Parker could have told them all about that.

We prefer to think that the Interparliamentary Union's opinion as to Mr. Roosevelt's character and purposes is a correct one, and to wonder whether Judge Parker will be surprised to learn, after November next, that he is still in a land of liberty and law.

Much that Judge Parker says about the tariff we approve. The present duties should be revised downward. The Republican party is justly criticised for repudiating the reciprocal treaties negotiated under authority of the Dingley act. It may not have been officially "avowed" that some duties were made very high upon the assumption that they were to be reduced by reciprocal agreements, but it certainly was expected that they would be so reduced. The Republican party is vulnerable in the matter of tariff duties and reciprocity, but the Democrats do not seem inclined to make effective use of these questions. Perhaps it is because some of those to whom the management of the campaign has been intrusted prefer that the tariff should not be changed.

Judge Parker now declares his "unqualified belief in the gold standard," thus to some extent making amends for voting at the last two national elections for the silver standard. He promises, if elected, to revoke Pension Order No. 78, and then to ask for a law that will give an age pension without reference to disability. This question could not attain the dignity of a political issue after Congress has promptly appropriated $1,500,000 to meet the payments which the Order might require to be made. He would promise to give the Filipinos independence "as soon as they are reasonably prepared for it." This, as we have said before, leaves room for no sharply defined issue concerning the Philippines.

On August 18th, commenting upon Judge Parker's assertion that "the common law affords a complete remedy against monopolies," we expressed the opinion that it was not feasible for the National Government to proceed against Trusts under what is called the common law. On September 12th, in his letter of acceptance, Mr. Roosevelt declared that the United States could not use the common law, the rules of which could be enforced only by the State courts and officers. Judge Parker does not now show in what way the common law should or could be used by the Federal authorities.

He admits that he cannot determine whether there is any common law which can be applied and enforced by the Federal courts, but he points to a Supreme Court decision that common law principles can be applied in certain cases involving interstate commerce. It does not appear that they have been so applied, and we do not remember that notable results have followed a use of the common law by States in Trust cases. Judge Parker's remarks on this subject have not been all that might reasonably have been expected, in view of the fact that for years he has been the head of New York's highest court.

The Judge speaks of "the charge of violation of national good faith" in connection with the Panama Canal route. If he believes the charge is well founded, he should have squarely said so. It did not prevent almost exactly half of the Democratic Senators from voting for the canal treaty.

Those who recall Mr. Danforth's report of a conversation with Judge Parker may have thought that the platform would suggest some reference in this let-

ter to the negro question. There is none. The Judge does commend "the pledge of the platform to secure to our citizens, without distinction of race or creed, at home and abroad, the equal protection of the laws and the enjoyment of all the rights and privileges open to them," but on reading a little further we see that this relates only to treaty rights and passports.

The Problem of the Poor

A POSITIVE and hopeful view of the great social problem of poverty has seldom been more effectively presented than it is by Dr. J. G. Phelps Stokes in an article that we publish in this issue of THE INDEPENDENT. There is a refreshing vigor and independence of thought in it. Holding that the immediate cause of poverty is inability or unwillingness to support one's self, Dr. Stokes insists that back of this immediate cause lie conditions for which society is responsible; yet he does not, with the crass philosophers of socialism, assume that new social machinery could eliminate poverty from the world without changes in the character and efficiency of human beings. Poverty is to be diminished, if at all, by improving human personality, and the improvement is to be achieved, if at all, through changes in the social environment.

It may be instructive to compare Dr. Stokes' positive suggestions, which we need not take space to summarize, with others that have recently been put forward elsewhere. In the Congress of Arts and Sciences at St. Louis Superintendent Maxwell, of the New York Public Schools, insisted that far more radical measures must be taken than hitherto have been thought necessary or expedient if the American public school system is to accomplish all that is expected of it in upbuilding body, mind and character. In a large measure, Dr. Maxwell asserts, the efforts of the school are defeated by the sum of conditions constituting tenement house life. Apart from the home the school can do little, and the tenement house works destruction to the home and upon the domestic instincts. Dr. Maxwell has the courage of his convictions, and says that the great cities must stop trying to improve the tenement house and must abolish it. By municipal enterprise great tracts of land must be acquired in accessible suburbs, and the working population must be housed there in decent, comfortable homes.

Future developments may confirm Dr. Maxwell's contention, but there is another side to the question that should be looked at. His assumptions are a part of a wider and commonly accepted belief that slum life is necessarily destructive of vitality and all the higher qualities of mind and character. This prevalent notion was sharply challenged the other day by G. A. Archdali Reid, M.D., of London, in a public discussion of Sir Francis Galton's theories of race improvement. Dr. Reid said:

"The assumption is made that the race is being so injured by the bad conditions that the descendant of a line of slum dwellers, if removed during infancy to the country, would, on the average, be inferior physically to the descendant of a line of rustics; whereas, contrariwise, the descendant of a line of rustics, if removed during infancy to the slums, would be superior physically to the majority of the children he would meet there. I believe this assumption to be a totally unwarrantable one. It is founded on a confusion between inborn and acquired traits. Of course, the influences which act on a slum-bred child tend to injure him personally. But there is no certain evidence that the descendant of a line of slum dwellers is on the average inferior to the descendant of a line of rustics whose parents migrated to the slums just after his birth. I believe, in fact, that while a life in the slums deteriorates the individual, it does not affect directly the hereditary tendencies of the race in the least. A vast mass of evidence may be adduced in support of this contention. Slums are not a creation of yesterday. They have existed in many countries from very ancient times. Races that have been most exposed to slum life cannot be shown to be inferior physically and mentally to those that have been less or not at all exposed. The Chinese, for example, who have been more exposed, and for a longer time, to such influences than any other people, are physically and mentally a very fine race, and certainly not inferior to the Dyaks of Borneo, for example."

When one stops to think of it one must admit that there must be a large element of truth in what Dr. Reid says. While holding, as we must, that environment acts with compelling power for good or ill upon the human race, we must not forget

that it acts by elimination and therefore by selection, survival and heredity, as well as by education, and we suspect that herein lies the cause of one important fact to which Dr. Stokes has drawn attention. More individuals resist disease, even when epidemics are raging, than fall victims to it. It is, therefore, important, as Dr. Stokes insists, not only to fight sickness by waging war against malignant bacteria, but also by increasing the resisting power of the human organism. Is it not probable that this restricting power has been developed, to the present time at least, chiefly by an elimination of non-resisting stocks? As Dr. Reid points out, this is certainly the explanation of the immunity of dark skinned races to malarial fevers. Is it not as certainly the explanation of the relative resistance of the white races to other diseases, like tuberculosis and smallpox, that sweep away dark skinned populations with frightful rapidity? May it not be that the conditions making up slum life have played an important part in creating the kind of human being that is capable of enduring the wear and tear of modern urban life?

We are not suggesting the maintenance of slums as a means of improving the human race. We are only putting an interrogation point after Dr. Maxwell's radical propositions. We doubt if it is necessary to proceed to any measure so extreme as the forcible removal of tenement house populations to the suburbs. The wiser plan of effort seems to us to be laid bare upon the lines marked out by Dr. Stokes. Let us, to the utmost of possibility, improve the sanitary and moral conditions under which the people dwell in both city and country. Let us, so far as we can, increase resisting power to both physical disease and moral wrong by building up personality in every way. When we have done all that we can, nature will still go on with her work of elimination and selection. She will then create a type of man adapted to an environment that has been made as decent and as wholesome as man can make it, with sufficient resisting power to endure the hardships and assaults that man cannot make end of, and of such efficiency as may be necessary for self-support and social helpfulness.

A New Way to Prevent Lynching

THE best informed man in the country on the prevalence of lynching gives facts and comments in this issue which invite most serious consideration if we do not wish the reputation of a barbarous people. That our people are awaking to the shame and danger of the condition certain efforts for its prevention will show.

It may not be wholly new, but practically and effectively the method taken by the Governors of Georgia and Alabama to stop lynching is new and gives some promise of being effective. It is by punishing in a mild way, and disgracing in a severe way, the officers, whether sheriffs or of the militia, who have not protected prisoners under their charge.

It will be remembered that at Statesboro, Ga., the prisoners had been tried in the regular court and had just been sentenced by the judge. Then, while under the protection not only of the sheriff and his officers, but also of the militia that had been called out by the Governor, a mob was allowed, or even encouraged, to seize the prisoners from under the very eyes of the judge and carry them off and burn them to death while the militia looked on and did nothing.

In this case Governor Terrell formed a Court of Inquiry. That seems very simple, and one might think inadequate, but less so than it seems. That court has brought in its conclusion that the troops were inefficient and cowardly. It criticises severely Captain Hitch and several other officers, praises one lieutenant for trying to do his duty, and declares that even after the mob had left the court house with their prisoners the military might have rescued them. Now follows the next step. Governor Terrell has ordered a court-martial, which is to meet this week for the purpose of deciding what punishment shall be meted out to the recreant militiamen. The result of it is likely to be that the officers will be disgraced, convicted of either cowardice or incompetency, and stripped of their shoulder-straps, while the company is very likely to be disbanded. At any rate they will surely remain all the rest of their lives under the ban of public contempt for their failure in duty, as proved

by a court-martial. This is something that will be as real as it is intangible, and will stiffen up the Georgia militia in any succeeding call to protect a prisoner, and mobs will be very slow to try to take another prisoner out of the hands of the militia, with the suspicion that they will shoot.

Another case is in Alabama. In Huntsville the prisoner taken from the military force of the State was not burned, simply lynched. Here Acting-Governor Cunningham called a military Court of Inquiry, and its conclusion was much the same. The prison was invaded by the mob, who set fire to it, and told the sheriff and soldiers that they would extinguish the fire if they would give up the prisoner. The sheriff yielded and the militia were ordered out of the building and saved their lives, but did not save the prisoner. Here the court finds the officers guilty of utter negligence of duty and they are also to be tried by court-martial. At the same time a grand jury finds Sheriff Rodgers guilty of neglect of duty or incompetency for having allowed a mob to remain several hours about the jail and taking no steps to disburse them, for permitting arson in the first degree to be committed in the jail, and refusing to fire upon the mob. It also finds Mayor Smith equally guilty for taking no steps to disperse the mob, and refusing to call out the fire department to extinguish the fire at the jail; and the Chief of Police is similarly condemned.

There have been one or two other similar cases in which the sheriff or the militia have been held up to scorn and disgrace for their cowardice or wilful neglect of duty. We observe that the public press generally approves this condemnation. It brings public sentiment in the most effective way to bear upon those who are guilty of not protecting our courts of law. The men cannot be convicted before a jury—that is quite impossible—but if they can be publicly branded as cowards that will do about as well. These men do not like to be called cowards. They may not object very much to the lynching, but they do object to being held to scorn as incompetent. The other day Senator McLaurin, in defending a man who had taken part in killing and burning a man charged with murder, a case which resulted in the death of eight more persons in the man-hunt, declared that the killing was justifiable and necessary in view of the conditions. If a United States Senator can make such a defense of an atrocious crime it is not strange that there may be found sheriffs and militia who will take no pains to protect a prisoner. And another Senator, Mr. Tillman, of South Carolina, in a letter on the Statesboro burning, says such violence is "to be deplored," and then goes on to excuse it at length, saying that "mobs are bad, but they are evidences of a spirit of liberty," and that "the whites are resolved to govern at whatever cost"; they "are on top and intend to stay there;" and this seems to be his remedy for lynching:

> "If the Fourteenth and Fifteenth amendments were repealed, and the idea that an educated negro is fit to govern white men abandoned, the negroes would soon cease to provoke the superior race, and such acts of blood and violence as the Statesboro tragedy would be things of the past."

This sentiment is not exactly that which will support the peaceful operation of law, or support the Governors of Georgia and Alabama. It appears to us that the method suggested by President Hadley for punishing trust robbers might profitably be applied at Washington in the cases of Senators Tillman and McLaurin.

Concessions of Conservative Theology

We know it is true that there remain in the Highlands of Scotland a few Gaelic-speaking ministers of the Free Kirk, who hold the accentuated theology of John Knox and the doctors of the Westminster Confession of Faith, for they have declared it in a supreme court of law and have made claims of theology as superior to morality. We presume also that there are portions of this country where in certain churches nothing has been learned for a hundred years and where still "the sun do move," if they do not, and "particular election" is still preached to the elected and the reprobated.

But even in the conservative ranks

generally a very different teaching prevails from what was held fifty or a hundred years ago. Science has done much, and criticism has done more. Something like a quarter of a century ago THE INDEPENDENT happened to say editorially that in our American colleges under religious control it was taught that the physical structure of man had its origin in a lower animal form. In denial of this statement a conservative Presbyterian paper published contradictions secured from the presidents of the larger part of these Eastern colleges; and, for a wonder, Princeton College was the only one of the number that admitted the statement to be true, but the President of Princeton was McCosh. We knew that we were right, nevertheless, and we inquired of the professors of biology in the same colleges, and they knew and acknowledged the fact. Now no statement of evolution troubles any one. It has conquered the religious field.

But still more effective and disturbing is biblical criticism. It has captured all, or nearly all, our theological seminaries; and even those which seem to resist it devote themselves chiefly to the attack on the extreme and radical results of hasty scholars, rather than to the principles involved. It is difficult now to find a teacher of Old or New Testament who is not more or less of a higher critic. The conservative men now would have been regarded as dangerous radicals thirty years ago. Sayce and Hommel are now conservatives, even as, a generation ago, Agassiz, who had been made a heretic for his doctrine of the separate origin of races, came to be the palladium of orthodoxy because he could not accept evolution.

A remarkable illustration of the change of view in so-called conservative circles is seen in the two great Bible Dictionaries that now hold the field. One of them, the "Encyclopædia Biblica," is confessedly and, in parts, wildly radical. The editor, Professor Cheyne, has gone daft in his reconstruction of Hebrew history and the Old Testament text; altho as to the text it is lower criticism into which his higher criticism has driven him amuck among the Jerahmeelites. The other is Hastings's "Bible Dictionary," reckoned as conservative, praised by the conservatives, but which through and through follows the principles of higher criticism and reaches its results in the history of both the Old Testament and the New and in its scientific treatment of the development of the Jewish religion and the Christion doctrine. Such teachings would have been condemned as radical thirty years ago in circles where now they are received without protest.

Perhaps an even better if not so complete an illustration is afforded in the teaching of the Sunday school. Naturally and properly the Sunday school is very conservative. Children are in the world's early age, and have to be taught concretely, by story and tradition rather than by theory and criticism. We have had no more competent spokesman of the American Sunday school than *The Sunday School Times*. It has carefully chosen the most conservative men to expound the International Lessons. We have, therefore, been particularly interested in the last issue of that journal where Professor Willis J. Beecher, long its accepted expositor of the International Lessons, formally discusses some critical difficulties in answer to numerous questions received from teachers.

His article is entitled "Three Questions Concerning Genesis." They are the following: "Are the biographies in Genesis biographical?" "Is there a biblical chronology before Abraham?" and "Is Adam a myth?"

He begins his answer with the basic principle of the higher criticism: "The narratives of Genesis are not formulated science, but literature." By "formulated science" he means the exact statement of historical fact, such as Prescott or Freeman might write. "The literary narrative," he tells these Sunday school teachers, "presents some of the facts only," and then "may arrange them by their pictorial rather than by their logical values." That is good higher criticism, what some of the critics call myth, and others parable or poem, teaching "some of the facts only," the religious facts beneath the "pictorial" setting. It is not surprising, he thinks, that we are likely to misread literally this "literary narrative," where the facts are "so arranged and stated as to make vivid ap-

peals to the imagination." Professor Beecher does not call these statements fictions, but "selected facts made vivid by poetic treatment."

When he comes to illustrate his meaning he holds that many of the persons mentioned in Genesis were not real individuals, as a mistaken interpretation would assume. He says it is not absurd to hold that "most of the biographies in Genesis may be traditions of tribal movements narrated in a personified form." He would not carry this too far, for Abraham, Isaac and Jacob were probably real persons. The lists of the names in the genealogies of the sons of Adam and Noah, with the dates of their ages, he takes not to be personal, but lists of races or dynasties, "ethnical." To be sure, "the Hebrew text makes the interval from the creation of Adam to Abraham to be about two thousand years, while some of the other copies extend this by a few centuries," but he admits the conclusion that this chronology cannot be accepted, for we have sufficient knowledge that man flourished long before the date thus assigned to Adam. These are "probably mnemonic tables of nationalities or of historical movements, put in personified form." That is, they are not historical, but "pictorial."

Professor Beecher comes back to the question, "Is Adam a myth?" His answer is, "If the current understanding of the first chapters of Genesis"—that is, that they are historical—"were the true understanding, perhaps we should be compelled to answer this question in the affirmative." But these are "figures of speech." Under the "literary" utterance are "really their important statements of fact," such as that man, dust of the earth, "is yet a living individuality;" that God made the animals "the subordinate companions of man;" and that "the highest type of companionship shall be that of man and woman." Such as these are, he says, "the facts that are really in these narratives," and we are to "eliminate the facts that are supposed to be in them but are not," and we shall then find them to be "finely wrought and truthful literary narratives of facts."

All this is pure higher criticism, and accepts a good part of its results. There is no difference between "literary" presentation of essential moral or religious facts and myth. Professor Beecher has defended the mythical, or parabolic, or poetic, theory of the early chapters of Genesis in the most gentle way, so as not to offend babes in Christ, but it is all the same thing in the end; and a generation or two ago it would have been regarded as downright heresy. The doctrine of inherited depravity depended on the historical and not the literary Adam's sin, for "as in Adam all died," etc. Doubtless these chapters are literature, but somehow those to whom they were first written took them to be facts, setting and all, both lesson and story, and we cannot doubt that the compilers so meant and understood them. We agree with Professor Beecher that they are invaluable "literary" monuments and of supreme religious value. They present us a God whom our twentieth century may well worship; but as history they must be weighed and sifted and corrected, and this even the common Sunday school teacher is taught, in the most guarded and inoffensive way, by the very conservative Professor Beecher. So moves the world.

Harvesting

YELLOW, yellow, yellow—and then red! The oat fields and the wheat fields made great golden patches on the hillsides; now the corn ripens, and the orchard looks tired holding its crimson burden. The trees have worked hard all the summer, and put an abounding life into fruitage. The Jonathans are like scarlet ropes all over the trees, and the Northern Spys roll down hill and rest in heaps in the hollows. Wise men have their apple trees braced with poles that have short crossbars; yet the limbs are snapping with the weight. The boys are picking up the drops for cider. They will stand around the casks to-morrow, with yellow straws sucking the mellow juice, till they are casks themselves. There is nothing more beautiful in the world than an orchard in harvest time; Spitzenbergs, Golden Pippins, Greenings, Red Streaks, Kings and Seek No Furthers—with Northern Spys; the wonderful result of the selection.

The rail fences are aflame with Virginia creeper; and just the other side of the big stone fence is a line of red sumach, alternating with blackberry bushes. It is hard to tell which is the most glorious at this season of the year; the blackberry should certainly do something to compensate us for its thorns. Red is the color of old age—and of the old age of the year. Blue is the working color of Nature. Yellow is the ripening color; and red is the color of resulting rest and peace. Hemmed in by these scarlet and crimson lines are the great cornfields, full of stooks. Bunches of men and boys are squatted or kneeling about, or sitting on huge pumpkins for seats, while they make the golden ears fly fast from their hands to the wagon. It would be well for vain artists and ambitious authors to see how these huskers are just as vain and proud of their achievements in twisting the ears from their wrappings. Every one manages in this world to get into competition; and why shall not the hands be as proud as the head? Others drive full loads to the cribs for winter storage. The hens have found the fields and go clucking and cackling about, filling themselves with scattered kernels or stripping dropped nubbins. Over the pasture fence the cows look wistfully at the pumpkins that punctuate the field, and with low mooings suggest that it is the dinner hour. They know better, for every cow can tell when it is twelve o'clock to the minute without watch or clock.

Grape harvesting grows in interest, partly because the new varieties multiply in number, while the quality improves, and partly because everybody likes grapes—and, for that matter, can have all he wants at a minimum cost. The grape is a food as well as a fruit, and will easily displace beef and mutton without damage to the eater. A few years ago, when appendicitis was the fashion, the mischief was laid to grape seeds; but now the disease is better understood to be a result of indigestion and overeating. One of our best medical authorities says: "Eat two meals a day, and eat at least one-half fruit, and you will not only escape appendicitis, but you will live twenty years longer, on the average." At any rate, we like grapes, and are willing to say that there is no harvest that more interests us. Thousands of baskets of black Wordens, and as many of white Diamonds, with carloads of Niagaras and Agawams, go every day across the country to feed the cities' millions at four cents a pound; that is one-fourth the price of cheap meat. There is not a little house lot, even in the city, that cannot grow its own vines; while in the country every barn and outhouse, as well as every house, may be covered with vines that yield their loads as regularly as the corn and potato fields. One Niagara and one Worden, or a Gaertner and a Moore's Early, trailed together over a homely cottage will make it beautiful, while paying half the rent.

The present pomological passion is plums; fifty years ago it was pears. Such men as Wilder and Barry will longest be known, not for what they wrote, but for their enthusiasm in growing pear seedlings. Then Kirtland made himself and Ohio famous for his Bigarreau cherries; and soon after Grant and Rogers and Ricketts stirred the whole civilized world with their hybridized grapes. A little later Budd and Gibbs were racing up and down the zones trying to find new varieties of apples, pears and plums and cherries hardy enough to widen the fruit belt up into Minnesota, while other Northern fruits went down to Texas. Just now we are in the Burbank era, when science is more accurately applied to the whole world of fruits—but is specially dazing us with the multiplication of choice plums. Any one who has not yet tasted a Burbank or a Wickson or a Maynard or a Gonzales has a new sensation that Byron might have envied. The earth has been ransacked for new sorts, and all these have been bred together to enrich our orchards with the beautiful as well as the valuable.

With all this rush and multiplication of products it is wonderful how Nature has arranged their times of ripening so that they shall not all come to our tables at once. The strawberry

begins in early June, or possibly in May, in our Northern fields; then the currant ushers in July, keeping close company with the black raspberry. The red raspberry, with the gooseberry and the cherry, fill up July. Blackberry pie and blackberries in milk are all that we need in August, but not all that we get. Pears and plums are already inviting us to their feast, and, with grapes, they fill up September, and keep us busy till frost time. Early apples began to drop in August, but the big crop must be gathered in October and November. When the last of the Greenings are placed in storage, snow flurries chill the air, and the evenings are so long that we are ready for cider and toasted cheese. Now we shall have a husking bee, and finish the harvest begun in the fields.

Whether it be in the orchard, or in the cornfield, or anywhere else that harvesting is going on, we have most in evidence the free and easy, or, rather, reckless, way in which American farming is done. In the spring there is a vast amount of guesswork in the seed that is planted; and all summer the farmer is at the mercy of wind and drought and insects and rust and floods. He is getting over his distaste for book farming, yet science has got a long job ahead before it can reduce agriculture to any rules of maximum products and minimum waste. The old fashioned farmer is gradually being wiped out by a better educated generation—but the change is slow. The coming farmer, from the employer down to the humblest employee, will be trained to observe, to experiment and to deal with Nature's notebook in hand. Such farmers will in the spring know almost to a certainty what their autumn harvest will be. Now the wheat crop swings between five bushels and forty bushels to the acre; and the speculators on the Board of Trade make and lose fortunes in a day—and the farmers lose, but rarely gain.

This is not the worst of it. With all these magnificent crops of fruits and cereals which are being gathered from our fields, not one farmer in ten has a decent storage room. They know little of the market, and yet they are compelled to rush their crops to a quick sale. Apple growers especially have no adequate storage room, and for that matter they know next to nothing about how to pick their fruit, how to handle it, how to store it, or how to sell it. The result is dead waste of one-tenth of the farmer's work; in some cases one-fourth. Worse yet is the loss of that rhythm and satisfaction which come from a completed job.

Judge and Boss

The convention of the New York Democrats was controlled by ex-Senator Hill, but his favorite candidate for the Governorship, Mr. Stanchfield, was laid aside at the suggestion of Judge Parker, and it was due to decisive influence from the same quarter that Judge D. Cady Herrick, of Albany, was nominated. Mr. Hill had turned to Edward M. Grout, Comptroller of the city of New York, but the opposition of Tammany removed him from the list, and at last Mr. Hill placed in nomination Judge Herrick, who had been his bitter political enemy. He had also assisted materially, two years ago, in defeating Mr. Coler, whose nomination for Governor Mr. Hill had procured. The nomination of Herrick appears to have harmonized all the warring elements of the party. He has been an able and impartial judge. At the same time he has been the political boss of his county. For this reason the New York *Evening Post*, an untiring supporter of Judge Parker, bolts the nomination. It cannot consistently stand for Herrick while attacking Governor Odell for holding the chairmanship of his party's committee, and his party for permitting him to do so. On the other hand, the *Sun*, which supports Roosevelt, is moved by its disapproval of Governor Odell and his methods to exert its influence for the Democratic nominee, Herrick. Abundant evidence of Judge Herrick's political activity while on the bench is found in the admissions of the leading journals of his party. Thus, the *World* (which supports his nomination) says:

"It is notorious that, after becoming a Justice of the Supreme Court, he continued to be the political boss of Albany, and that until the secret ballot system was adopted the methods of the Albany 'machine,' under his more or

less direct leadership, were alleged to be tyrannical and corrupt. The long association of such a fine and scholarly mind with low and disreputable ward politicians has puzzled many lawyers who have praised his work on the bench. His bitterest enemy would not credit a charge of venality against him. His warmest friend would not deny that he has damaged the reputation of the judiciary by his participation in practical politics."

Judge Herrick desired to be nominated for the place vacated by Judge Parker. Fortunately, the two parties have agreed upon a good ticket for this and another vacancy on the bench. Altho Judge Herrick's nomination repels some who think a judge ought not to be a political boss, it does not appear to be a weak one. He is a man of keen intellect, courage, energy and independence, and he will profit by the shortcomings and quarrels of the Republican organization.

That Reasoning Horse

It is worth while to pursue a little the facts about that educated horse, the wise Hans, which the Germans are talking so much about; for there may be more importance in the fact of the education of a horse to reason than in the discovery of half a dozen chemical elements. If horses can be trained to reason, why not dogs? And what limit may there be to it in the generations? The owner, Herr Von Osten, once a teacher in mathematics, is not educating the horse for exhibition purposes, but simply in the interest of science. The report of his powers is given by Dr. Heinroth, of the Berlin Zoological Garden. In the presence of Herr Von Osten, who coaxed the horse by feeding him with carrots, he answered correctly, by stamping with his right fore foot, such questions as $6 + 2$ and $4 + 3$. He then gave correctly the multiples of 12 and such sums as $72 + 14$. He was asked in German words, "What is the difference between 43 and 6?" and immediately pawed the answer. Hans can, says Dr. Heinroth, convert common fractions into decimals (an astounding statement), and can tell time by the clock. When asked, "It is now 40 minutes after twelve; how many minutes before one o'clock?" he immediately gave twenty strokes. He tells colors, and when asked which in a row of numbered colors was green he indicated the right one by five strokes. One would think this must be deception, for how can a horse, without words, keep count of numbers up to 86 at least? But Dr. Heinroth questioned the horse in his stall, in the absence of his owner, and got equally clear and correct answers. It is an old question which this recalls, "Is a man better than a beast?"

The Policy of Disdain

A Paris review has just published some correspondence of Ibsen with the eloquent French Prof. Georges Brandès, from which we quote an expression of policy which is not beyond criticism. Ibsen says:

"I understand that you have founded a society. Do not put too much dependence on those whom you have rallied to your support. . . . I am not at all sure that your position will be strengthened in this way. In my view the solitary is the stronger."

He would treat his enemies precisely as he would treat his friends:

"As to the attacks of which you are the object, the falsehoods, the calumnies, etc., I give you the advice which I have from my own personal experience found to be good. Maintain a lofty attitude; it is your only proper course. Move straightforward; do not let it seem for a single instant that a word of your enemies has attracted your attention. Act, indeed, as if you were quite ignorant of the existence of your enemies. . . . One sinks into vulgarity who tries to defend himself; avoid that. Begin a new series of lectures; keep a calm, irritating quiet, a happy disdain, of all that shakes and threatens ruin about you."

But circumstances alter cases. What may do for a literary man will not do for a candidate for the votes of the people. He must defend his record.

Party Confusion

It is not an ethical question really, rather a financial and prudential one, which is raised between the advocates of free trade and those of protection, and it is unfortunate for those who have been long associated with the Republican Party and who are attached to the prin-

ciples on which it was organized that it has so far switched over to one of the theories as to the tariff. Had the party large invested funds, like the United Free Church, those funds might, on the principles of the late Scotch decision, be scooped up by a small remnant who "voted for Fremont" and who stick to the old platform. We do not find it easy to wax enthusiastic over high tariff, and should be glad to see various reductions made, as they say, by its friends. Equally it does not surprise us to find Democrats who want protection. We take it that the Democratic candidate for Vice-President is no less a Democrat because he declares that he believes in incidental protection of American industries. He says:

"I am for a tariff that will yield sufficient revenue for the economical and proper expenditures of the Government, and in that tariff I believe incidental protection to our industries is right and proper."

That is what we all say except a few radicals, what we presume Judge Parker himself would say if he were pinned down, and what President Roosevelt says. But there are yet some ethical principles more or less involved between the parties, and one of these is what has driven one of the most prominent free-traders and anti-imperialists of Boston out of the Democratic Party and into the support of Mr. Roosevelt. He believes, as we do, that the attitude of the party toward the negro, in its platform, its candidates, its managers, and in its treatment of the race wherever it is dominant, is wrong and bad, and this sends him back to the Republicans. It is a pleasure to see this difference brought to notice. We observe that another distinguished Irish Democrat of Boston, Mr. James Jeffrey Roche, has gone over to Roosevelt for a similar reason, and says that he has no use for the arrogant Anglo-Saxon attitude toward other races.

Piercing the Earth

One would think that about the most useless piece of work that could be imagined would be the digging of a hole in the ground simply for the hole and not for the ore that might be found in it. But the President of the Section of Engineering in the late meeting of the British Association said that it is much more important and useful to have a deep hole pierced into the earth than to go to the North or South Pole. The deepest shaft at any mine on the earth is only about a mile deep; he would have one ten or twelve miles deep. The purpose he did not very well explain, but it is clear that it would have some scientific value. It would show how the heat increases as one descends, and it would show the structure of the lower rocks, and possibly bring us to sources of metals, for we know that the rocks on the surface are much below the specific gravity of the earth as a whole. Mr. Parsons gives this table of the time and expense of digging such a shaft:

	Cost.	Time in years.	Temp. of rock. ° F.
For 2 miles depth from the surface	$2,500,000	10	122
For 4 miles depth from the surface	5,500,000	25	152
For 6 miles depth from the surface	9,000,000	40	182
For 8 miles depth from the surface	13,500,000	55	212
For 10 miles depth from the surface	18,500,000	70	242
For 12 miles depth from the surface	25,000,000	85	272

The chief difficulties would be the pressure of air at great depths and the cooling of the shaft, but these could be obviated. Apart from any possible discovery of metal or ore the only financial benefit that it is easy to conceive is its use as a source of heat. If one of these days coal should be exhausted one might possibly, by going down twelve miles, get a supply of heat for mechanical purposes, digging a shaft where now we erect a chimney.

It has sometimes been said that if you want to stop railroad accidents you must put a railroad director on the cowcatcher. That does not always work. Last week the *Præses præsidum* Director of all directors in the country, Mr. J. Pierpont Morgan, had a special train made up for himself and chief Arch-primate of Great Britain, and while running at top speed the train collided with another train and a number were injured, and the Archbishop and Mr. Morgan had a great shaking up. The cowcatcher plan will not always work.

Insurance

Insurance in Japan

THERE are some forty life insurance companies doing business in Japan. During the year ending June 30th, 1903, these companies, according to the latest available information, received in premiums a total of 6,993,422 yen. (One yen is equivalent to about fifty cents in American gold.) They expended for losses during the same period 2,117,817 yen. The nineteen fire insurance companies collected in premiums 3,552,674 yen during this period, and paid 1,154,887 yen for losses. Three Japanese marine companies received 2,319,385 yen for premiums, and paid out in losses 1,302,445 yen.

Insurance companies organized under systems obtaining in European countries were introduced into Japan about the year 1881. Laws were speedily passed providing for supervision and control, which have since undergone modification from time to time. In 1899 a revision took place and these laws now remain in force. Important provisions appearing in the Japanese Code and applying to insurance are as follows:

"If the sum insured exceeds the value of the subject of insurance the contract is void as to the excess, and if two or more contracts of insurance are made on the same property, each is valid only for such proportion of the loss as the amount insured bears to the value of the whole property at the time of fire or loss; material changes in risk to be brought to the attention of the insurer, otherwise the contract is null and void; no underwriter is liable for loss occurring by reason of war, civil commotion or the bad faith or gross negligence of the insured; the capital of a joint stock company or the fund of a mutual company must be more than 100,000 yen, and only one class of business is permitted by the same company."

For the regulation and supervision of foreign insurance companies special provisions are in force as to capital and deposits required.

Russian Insurance

THE present Russo-Japanese War makes all kinds of statistics relative to Russia especially timely. The following interesting figures showing the activity of Russian and foreign life insurance companies in the Russian Empire during 1903 are based upon a report made on the subject by Consul Smith, of Moscow:

RUSSIAN.	Policies.	Insurance.
General Life Ins. Co. (founded 1900)	4,287	$5,678,163
Insurance Co. "Rossia" (founded 1881)	3,251	5,191,330
Russian Ins. Co. (founded 1895)	2,699	3,819,100
Russian Ins. Co. (founded 1901)	2,127	3,803,055
Insurance Co. "Jakor" (founded 1872)	1,652	1,855,533
St. Petersburg Ins. Co. (founded 1858)	902	1,118,700
Insurance Co. "Solicitude" (founded 1892)	446	536,685
Totals	15,364	$22,002,566
FOREIGN.		
N. Y. Life Ins. Co. (operating in Russia since 1885)	4,987	$10,469,010
Equitable Life Ins. Co. (operating in Russia since 1890)	1,924	3,753,600
L'Urbain Ins. Co. (operating in Russia since 1889)	1,535	3,098,225
Totals	8,446	$17,320,835
Total Russian and foreign companies	23,810	$39,321,401

THE committee of the National Board of Fire Underwriters has just written a letter to President Roosevelt on the fire danger of congested cities, and calling his attention to the fact that possibly the Department of Commerce and Labor may be able to do something in some way or other to prevent future conflagrations, which "are largely preventable." The letter adds that "unless effective measures are taken to improve conditions, especially in our larger cities and towns, the fire waste is sure to be greatly increased, swelling the tax for insurance and increasing the property values wiped out of existence, to which extent the country is made poorer."

....*The Insurance Herald* is credited with the surprising if not incredible statement that ex-Senator Henry Gassaway Davis, the Democratic candidate for the office of Vice-President, has no use fo insurance of any kind. According to the *Herald*, Mr. Davis, while president of the West Virginia Central Railroad, permitted the shops of that road to go entirely without the protection afforded by fire insurance, which is now considered an ordinary business precaution. The *Herald* is further quoted as stating that Mr. Davis carries no insurance upon his palatial home and that he abhors both life insurance and doctors.

Financial

The Tax Should Be Repealed

THE New York State Association of Savings Banks has appointed a committee, of which William H. S. Wood (President of the Bowery Savings Bank) is chairman, to secure the repeal of the so-called franchise tax imposed upon the savings banks of this State three years ago. This tax is one per cent. of a bank's surplus or guaranty fund and of its undivided earnings. The two leading political parties have been requested by the committee to favor the repeal of it and to define their attitude in their platforms. In the Republican platform there is an equivocal declaration, which may or may not have committed the party to repeal. The Democrats in their platform sharply attack the tax, asserting that it is unnecessary and oppressive, as well as a crude and unscientific imposition upon those least able to bear the burden. The committee intends to address the voters of the State by means of leaflets setting forth tersely the arguments which show that it is both unjust and inexpedient to discourage thrift among persons of small means by such taxation. No argument should be needed in support of the committee's position. The tax ought never to have been imposed; it should be promptly repealed at the coming session of the Legislature.

Transcontinental Railways

OWING to the activity of transcontinental railway shares in the market last week, much gossip was published as to large purchases for change of control. It seems probable that the Atchison already is, or soon will be, controlled by one or all of its competitors. Recent developments seem to point to joint control and a new exemplification of "community of interest." The movement is toward a further consolidation of all the roads west of the Mississippi, a consolidation accompanied by what will be virtually a violation of the Anti-Trust law in the central and southern parts of the territory west of that river, similar to the violation with respect to which the law has been enforced in the Northwest.

Financial Items

IT is asserted that a large block of Atchison stock, from 300,000 to 400,000 shares, has recently been acquired in the interest of the Union Pacific.

....The expected reduction of prices was made last week by the Steel Billet Pool, or Association. Billets are to be $19.50 instead of $23, and sheet bars $21.50 instead of $24.

....It is reported that the Steel Corporation will build works in Canada, owing to the new Canadian duties on steel products and the tax on imported steel when sold below prices prevailing in the home market.

....The Illinois Central's report for the last fiscal year shows that the increase ($2,957,000) of operating expenses was due largely to higher wages, the additional payment to employees engaged in operation having exceeded $1,200,000.

....Officers of the American Sugar Refining Company, or Trust, being about to inspect the beet sugar factories of the West, it is said that the company now directly or indirectly controls the production of nearly four-fifths of the country's output of beet sugar.

....The Bankers' Trust Company's first dividend, 1½ per cent., will be paid on October 1st. It calls for only $15,000, altho the earnings for the first eighteen months of business have been in the neighborhood of $180,000. This indicates the wise conservatism of the company's board, which is composed of prominent bankers.

....Dividends and coupons announced:

N. Y. Cent. & H. R. R. R., 1¼ per cent., payable October 15th.

N. Y. Air Brake Co., 2 per cent., payable October 15th.

Am. Telephone & Telegraph Co., $1 50 per share, payable October 15th.

Union Typewriter Co., 3½ per cent., payable October 1st.

Union Bag & Paper Co., Preferred, 1¾ per cent., payable September 30th.

Westinghouse Elect. & Mfg. Co., Preferred, 2½ per cent., payable October 10th.

Nat'l Park Bank, quarterly, 4 per cent., payable October 1st.

Garfield Nat'l Bank, quarterly, 3 per cent., payable September 30th.

Coupons of Southern Pacific Co. (various divisions), payable October 1st (see advt.).

The Independent

Vol. LVII NEW YORK, THURSDAY, OCTOBER 6, 1904 No. 2914

Survey of the World

Political and Other National Topics

It is asserted by prominent supporters of Judge Parker that he has now taken the management of the Democratic campaign into his own hands, has marked out four territorial districts, and has assigned certain men to each of them. He will be in command, it is said, in the first district (New York and Connecticut), and Chairman Taggart will have control in the third, which comprises Indiana, Illinois and Wisconsin. Mr. Cleveland, it is authoritatively announced, will not make speeches at any time or place during the campaign, altho he will otherwise do all in his power to promote Democratic success. Mr. Hearst's paper in New York, which loyally supports the ticket, gives much prominence to a report that Senator William A. Clark has promised to give $1,000,000 to the Democratic campaign fund, or to be responsible for the collection of $1,000,000 from himself and others. In Rhode Island Governor Garvin has been renominated unanimously upon a platform commending his war against the bribery of voters and his plans for Constitutional reform.—Commenting upon Judge Parker's remarks concerning Pension Order No. 78, Commissioner Ware says that the order "simply anticipates by a few months or a few years what a veteran could get any way," and that the amount to be paid under it will be "comparatively small, especially in view of the saving which it makes in administration." The cost of such a service pension law as Judge Parker promises to recommend has been estimated in Congress, he says, at from $20,000,000 to $40,000,000. Ex-Attorney-General Knox spoke in Philadelphia last Saturday night before a large audience upon the questions of the campaign, especially with reference to the enforcement of law during Mr. Roosevelt's administration, and Judge Parker's remarks upon the use of the common law against Trusts. The Judge's rejoinder to the President, he said, "was either intended to mislead the people, or he does not know what the case to which he refers decides or what the rule of the common law is as to combinations in restraint of trade." The decision in that case did not mean "that the common law can prevent persons from making combinations or monopolies in restraint of interstate commerce, and that the United States could proceed against them at common law:"

> "An agreement in restraint of trade is not and never was unlawful at common law in the sense that the agreement could be nullified by public authority or that persons not parties to it could sustain an action against it for damages. It takes statute law to confer such remedies, and the President is clearly right in saying 'there is no common law of the United States' for any such purpose."

—A dispatch having been shown to Archbishop Messmer (Catholic) asserting that the Church authorities at Rome desired the election of Mr. Roosevelt, he said that he could not speak for the Vatican, but he believed that the President's policy in regard to the Philippine friars had met the approval of the Vatican authorities and that there was "a feeling that in case of his election they would be assured of straightforward and considerate treatment." For himself, he should be glad to see Mr. Roosevelt elected, regarding him as "an hon-

est, straightforward man, who desires to do right," and believing in carrying out his policy he would give the Philippine Catholics fair treatment.—President Wheeler, of the University of California, who recently called upon the President in Washington, says the latter told him that Mr. Hay had definitely decided to remain in the Cabinet if the Republican nominees should be elected.—Speaking at the Universal Congress of Lawyers and Jurists, John W. Foster, formerly Secretary of State, said last week:

"It has been reported in the press that the Secretary of the Navy has announced himself as in favor of a navy equal to the greatest navy in the world. I trust he has been misquoted. Our Government should hold itself ready to enter into an agreement for international disarmament and not for the increase of the navy."

—A memorial signed by many prominent Englishmen has been presented to the President by Secretary Morel, of the Kongo Reform Association, requesting the United States to promote an independent inquiry, sufficiently searching and authoritative to enable the Powers by whose sanction the Kongo State exists to decide whether that State has fulfilled its obligations. The intervention of this country, says the memorial, can be exercised effectively and without prejudice because the American people, having no territorial possessions in the African continent, cannot be exposed to the charge, brought by the Kongo Government against British advocates of humane treatment of the natives, that they are influenced by selfish motives.—Senator George Frisbie Hoar, of Massachusetts, died at his home in Worcester on the 30th ult., after an illness of many weeks. It is expected that either Attorney-General Moody or ex-Governor Crane will be appointed in his place.—The new battleship "Connecticut," which is the largest and most powerful vessel of our navy, was launched on the 30th ult. at the Brooklyn Navy Yard. Unknown persons sought in three ways to sink her. Six months ago it was discovered that holes had been bored through several of the rivets that fastened her keel plates. Just before the launching a heavy bolt was found protruding from the ways and designed to tear open the bottom of the ship. After the ship had entered the water one of her compartments filled. Inspection revealed a hole drilled through her side far below the water line.

The Question of Filipino Independence

Immediately following the publication of Judge Parker's letter of acceptance, with its remarks about independence for the Filipinos, there were given to the public, by the President, the following extracts from a letter, dated August 15th, just received from General Wright, Governor of the Philippines:

"The continued discussion as to the capacity of the Filipino for self-government and his immediate or ultimate independence is having its effect here and makes our task more difficult than it otherwise would be. The less a man is equipped with intelligence and those qualities which make for good citizenship the more easily can he be persuaded that he is the possessor of all those qualities. This people have their full share of ambition and vanity, and they also have their full share of reckless, half formed characters who are ready for intrigue in any direction which promises them profit or power. It is this class which has largely given force and direction to the Aglipayan movement, and has recruited its ranks from the ignorant and dangerous element. In this general connection I may say to you as a matter of information that the agitation in the United States for Filipino independence, and the spoken and written utterances of prominent men there who are urging it, are all brought here and published in the native newspapers and are being made the text for editorials insisting that the Filipino people are now ready to become an independent nation. The effect of all this is distinctly injurious. Its tendency is to restore the influence of the old insurrecto leaders and to make them active in preaching the old propaganda. This, in turn, has the effect of demoralizing and weakening the more conservative and thoughtful Filipinos, who fear that if they speak out as they really think they will be considered the enemies of their people and lose their prestige with them. Those of the more prominent and best educated, and who naturally have their ambitions, are inclined to join in the general cry."

At the opening of the Universal Congress of Lawyers and Jurists at St. Louis, on the 28th ult., Justice Brewer, of the Supreme Court, president of the Congress, said:

"The purchase which this great Exposition commemorates was not the result of conquest and came not at the end of war. Not a gun was fired, not a life was lost. A lawyer, not a soldier, made the transfer. The glory of that transfer is one of the laurels of our profession.

"You can see twenty acres of Philippine life at the World's Fair, but you cannot see a square rod of the Constitution. Perhaps it is because it has been judicially declared that there is no connection between the two."

Lynchers and the Race Problem

Altho citizens indicted for taking part in the lynching of Horace Maples, at Huntsville, Ala., on September 7th, have promptly been acquitted by trial juries, the militia company that failed to protect the jail and the prisoner has been punished. A military court reported that this company's officers were ignorant with respect to their duties and that it made no respectable effort to prevent the lynching. Its members were on guard in and around the jail. By order of Acting-Governor Cunningham the company has been mustered out.—Eighty negroes sought refuge in Harrodsburg, Ky., last week, having been driven out of South Fork, in Pulaski County, where a majority of them had been working on a railroad and living in a camp. The wife of one of these workmen stole some clothing from a farmer's wife, and, when pursued by the latter, stabbed her, inflicting a mortal wound. It is reported that the offending woman was lynched. —In Portsmouth, Ohio, last week, Bishop Derrick, of the African Methodist Church, attending a conference there, asked for a glass of soda water at a local druggist's, and was told that it was not sold there to negroes. The conference denounced the druggist by resolution, saying that it resented "this uncalled-for, un-Christian and inhuman treatment."—Speaking on "The Negro Question," last week, in New York, at a meeting of the Protestant Episcopal Convention, attended by several Bishops, Coadjutor Bishop-elect Strange, of North Carolina, declared that as a first step toward a solution of the problem there must be "an unequivocal social separation of the races, separation in the schools, in the churches, in social entertainments, and in domestic life." Exceptions should be made, however, in the cases of negroes "who have ability as teachers in their race." "I tell you," he continued, "that the late amendments of the Constitutions of Southern States in regard to the franchise are an effort to answer the best conscience of the South, and they give us hope of a pure and honest government. Now that we have by law swept away from the ballot box a mass of ignorance, I believe that the conscience of the South is growing strong enough to see to it that the law shall be administered with equal justice to whites and blacks." One of the following speakers was Booker T. Washington, who did not reply to these remarks of Dr. Strange, but spoke of the progress made by his race under adverse conditions.

On the Panama Isthmus

In a public address at Chicago, last week, Mr. Wallace, Chief Engineer of the Panama Canal, said that George Ehle, one of the engineers employed on the isthmus, who had been engaged for four months in tracing the sources and course of the Chagres River, had made an important discovery. He had ascertained that the river could be diverted to the Pacific coast at a cost of $16,000,000, and this would release $20,000,000 of the $36,000,000 which had been set aside in the original estimates for the construction of locks. The sudden and tremendous freshets of the Chagres have been regarded as the great obstacle to the construction of a canal at the sea level. This diversion of the river would not enable the engineers to dispense with locks, but would permit a considerable lowering of the summit level. It is said that six months may elapse before the submission of all the reports upon which the Commission will base its decision as to the final plans. In another public address Mr. Wallace said that the purchase of the Panama Canal franchise and property was the best investment ever made by the United States. He would undertake to complete the canal in eight years at a cost of $200,000,000. The work could be done with a force of from 10,000 to 12,000 men. He denied that the climate would not permit Northern white men to

live on the isthmus in comfort and safety. —It is reported that prominent citizens of Panama are so dissatisfied with the action of our Government on the isthmus, under its interpretation of the treaty, that they even propose that Panama shall appeal to The Hague Court. They complain that the port revenues of Panama and Colon have been diverted to the United States; that the Dingley tariff operates to the great disadvantage of their people; that merchants can only save their trade by moving into the zone, and that the zone encroaches upon the territory of their cities.

British Politics

The movement against the ecclesiastical control of the schools as provided by the Education Act of 1902 continues to grow in numbers and intensity of feeling. Passive resistance to the operation of the law by refusal to pay taxes for the support of the Church schools is now settled into a fixed and organized policy. Summonses against the delinquent rate-payers are now being issued at the rate of 1,700 or more a week. Since the movement began there have been over 1,100 forced sales of property to cover the rates refused and more than 33 sentences of imprisonment. In Wales Mr. Lloyd-George, with the support of the National Free Church Council in England, is carrying out a systematic policy of opposition, which, it is expected, will paralyze the Church schools without any direct violation of the laws. The plan provides for the wholesale resignation of the education authorities, both local and county, the dismissal of all teachers employed by the local authorities, the closing of all Council schools, the withdrawal of all the non-conformist children, about three-fourths of the total, from Church or voluntary schools, and the opening of schools in the chapels for them. This would throw the whole burden of maintaining and managing the schools on the educational department of London, which, it is believed, will not be able to carry the burden.—The sudden death of Sir William Vernon Harcourt has deprived the Liberals of one of their greatest leaders, "one of the few eminent statesmen who received their political training at the hands of Gladstone and Disraeli." He was born in 1827 and educated at Trinity College, Cambridge. After graduation he studied law and entered journalistic work, becoming distinguished as an authority on international law by the series of letters published in the London *Times* over the pen-name of "Historicus" during the American Civil War. At the age of 41 he entered Parliament, and in 1873 took office in the Gladstone Government as Solicitor-General, at which time he was knighted. As Chancellor of the Exchequer in 1886 and 1892 his most important work was the establishment of death duties, ever since then a fixed part of British fiscal policy. In 1898 he resigned his position as leader of the Liberal opposition in the House of Commons. He was thrice offered a peerage, but consistently refused to accept it.

Strikes in France

The strike of the dock men and sailors at Marseilles has reached an acute stage. A large number of the men refused to accept the agreement made between the unions and the companies or the decision of the arbitrators to whom the dispute was referred, and there is likely to be continued and more violent rioting if any of the men attempt to work. Troops have been mobilized on a war footing and several thousand cavalry protect the docks. Conservative organs accuse M. Pelletan, Minister of Marine, who is a Socialist, of sympathizing with the strikers to the extent of overlooking their breaches of the law, while at the same time he is stringent in the requirements he puts upon the companies.—The Bureau of Labor of the Ministry of Commerce has just issued a report on the strikes of 1903. During the year there were in France 567 strikes, in which 123,151 men took part, amounting altogether to 2,441,944 days of idleness. The loss in wages of the strikers, and those numbering 198,621 who on account of strikes were deprived of work, was $1,700,000. The average wages before the strikes was 69 cents a day and after the strikes was 73 cents. To recover the sum lost in wages during the strikes would require at the advanced rate 281 days' work. This does not include indirect losses due to injury to the business

and its diversion into other channels. In 416 strikes out of 567 the workers were members of unions. It is calculated that 21.53 per cent. of the strikes resulted in a complete victory for the employees and that in 39.32 per cent. they were entirely unsuccessful.

Socialists as Peacemakers

Notwithstanding the sharp antagonism as to methods which was exhibited at the International Socialist Convention at Amsterdam between the German leader, Herr Bebel, and the French leader, M. Jaurès, the influence of the Socialists is still powerful in allaying the hatreds engendered by the Franco-German war. At a meeting of the Frech Socialist leaders at Carmaux the following resolutions, drawn up by M. Jaurès, were adopted:

"We look forward with enthusiastic hope to the day when France and Germany will be completely reconciled through the strong Socialist influence existing in both countries, and will work together throughout Europe for the progress of civilization, the elevation of labor, the development of science and art, the extension of international peace and the simultaneous disarmament of the great Powers, thus permitting the vast budgets to be utilized for internal improvement, instead of devoured by war and armed peace."

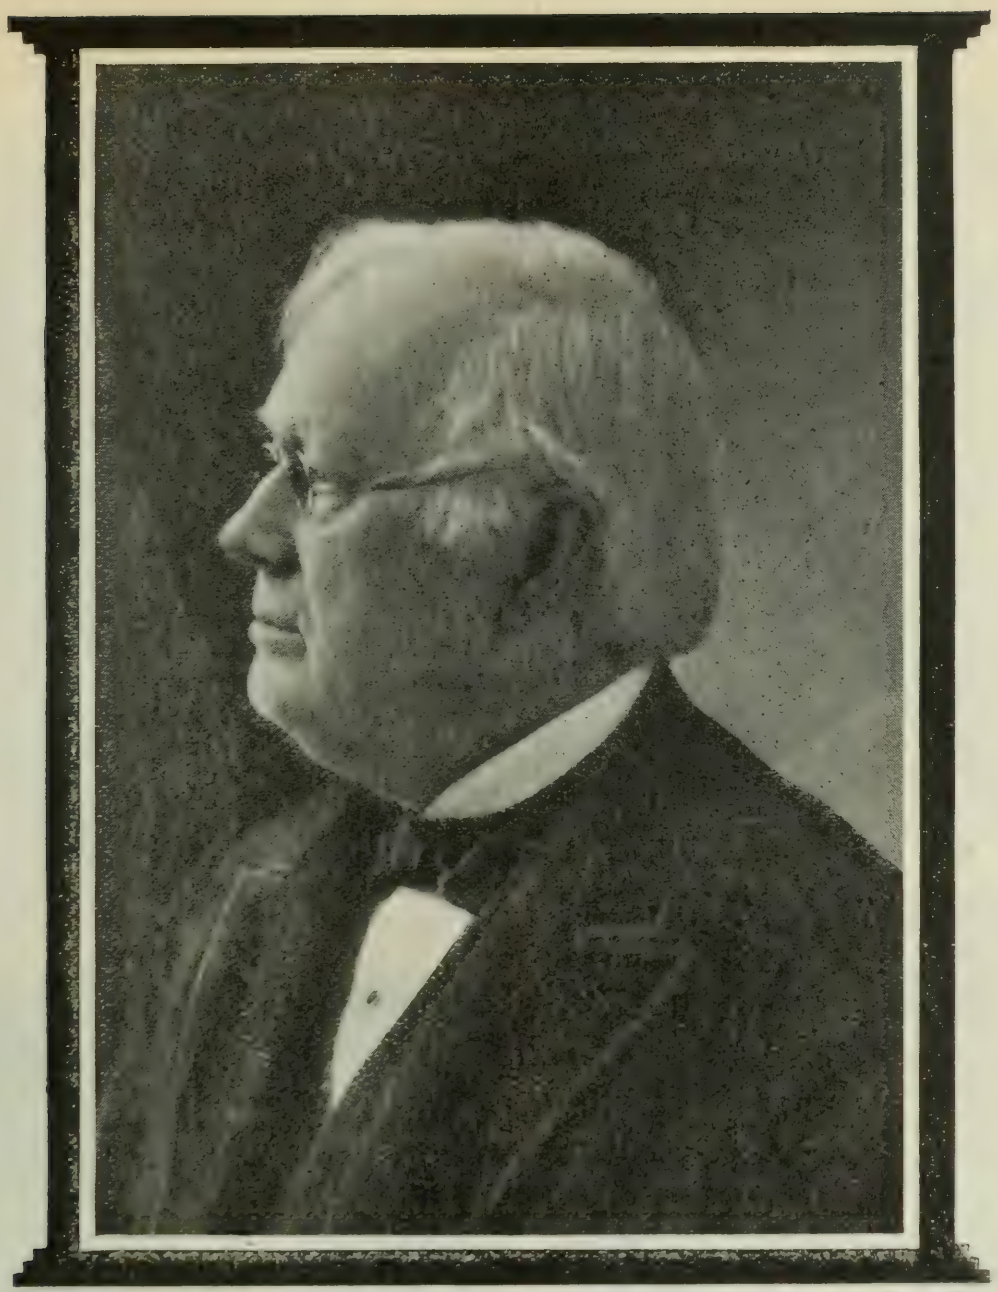
Since the Combes Cabinet is kept in power only by the support of the Socialist Deputies such a resolution is significant as indicating that the Government will move as rapidly as public opinion will permit in substituting new issues for the old policy of revenge.

The British Treaty with Tibet

The treaty recently signed at Lhasa between Colonel Younghusband and the Tibetan authorities is recognized by the press of all countries as a great triumph of British diplomacy, as the expedition itself was a triumph of British prowess. By expressly disclaiming a protectorate and not leaving a garrison or even a resident at the Tibetan capital the British have deprived Russia of any valid ground for objection; by securing the approval of Pekin for their action, and, in fact, restoring the authority, almost vanished, of the Chinese over Tibet by the use made of the Amban or Chinese resident, they have obtained the friendship of China; by raising up a rival to the Dalai Lama in the person of his spiritual peer, or even superior, the Tashi Lama, and securing for him the support of the Amban, they have divided the priesthood in theological as well as political matters, and at the same time they have secured their main objects, freedom of trade for India with her northern neighbor, and the checking of the influence of Russia, and, by the occupation of the Chumbi Valley for the indefinite period until the indemnity is paid, they have kept open a route by which they can return whenever they wish on any of the various pretexts which will necessarily occur. So far Russia has made no public protest, but it is reported from St. Petersburg that she is preparing a note to be sent first to China objecting to what she considers a virtual protectorate. The comments of the French and Russian papers are remarkably mild and friendly. The *Novosti,* of St. Petersburg, says:

"If it be true that rich auriferous soil exists in Tibet, the treaty may become very advantageous to Great Britain. As for Russia, we have already said that her interests in Central Asia are bound up with those of Great Britain. The two nations are surrounded by the same enemies and combat the same dangers, so that the success of one of them should not excite the envy or discontent of the other. That is why we must not look upon the British protectorate over Tibet as a political event directed against Russia's interests. As the treaty was signed with the knowledge and consent of Russia, it is to be supposed that it will have no evil influence on Anglo-Russian relations, and that when the hour of victory over Japan shall have struck Great Britain will behave with equal calmness and good will."

The War



This has been a quiet week in Manchuria, and if any important movements have been made on either side they have not been disclosed to the public. The Russian forces remain at Mukden and Tie-Ling, while the Japanese front is along the branch railroad running from Yentai to the coal mines on the east. Both positions are strong, and the situation is not likely to be changed until the armies are thoroughly recuperated from the heavy losses and fatigues of the battle of Liao-Yang. In obtaining reinforcements and supplies

the Japanese now have a great advantage. They have changed the gauge of the railroad as fast as they have obtained control of it, to suit their own rolling stock, and they are now running regular trains from the sea at Dalny to Liao-Yang. Besides this, the Liao and Hun rivers, now in their hands, afford cheap and easy transport service all the way by water to the seat of war. Troops can be brought from Japan to Liao-Yang in four to six days, while, on the other hand, the shortest time that can be made by express authorities estimate the Japanese forces near Liao-Yang at 144,000 infantry, 6,300 cavalry and 638 guns. An emergency ordinance amending the army conscription laws has been issued at Tokyo, which, it is estimated, will make 200,000 more men available for the army. It extends the time of service of the second reserves from five to ten years and abolishes the distinction between the first and second reserve conscripts. From the Russian headquarters come reports of brilliant and successful cavalry raids on the

A Section of the Manchurian Railroad, Near Dalny and Port Arthur, Now Used by the Japanese for Conveying Troops Direct to Liao-Yang. From Photograph by V. Gribayedoff, Paris

from Moscow to Mukden is 16 days, and troop trains require nearly six weeks. Both sides are hampered by the large number of wounded. It is estimated that there are some 48,000 in the Russian hospitals, while from Tokyo it is reported that there are 45,000 sick and wounded in Japan alone, not counting those at Port Arthur and in the northern armies. The military hospitals at Tokyo, Osaka and Hiroshima contain 10,000 each. Nine thousand have recovered sufficiently to be sent to health resorts for convalescence. According to the calculation of the military experts of the London *Times* General Kuropatkin has now about 165,000 men in the field. This number may be raised during the month by the arrival of the Sixth Siberian Corps of reserves to about 200,000. Russian Japanese center and right and left wings. In the first the Japanese, who had advanced to within twenty miles of the Hun River, were driven back as far as Yentai Station. General Rennenkampf's Cossacks, with a battery of artillery, made a rapid march around General Kuroki's right flank, covering a distance of 80 miles in 52 hours, and attacked the Japanese lines of communications at Pensilou, where their two pontoon bridges cross the Taitse River. A detachment of cavalry captured 17 Japanese junks loaded with ammunition on the Hun River and blew them up. A similar successful raid was made on a flotilla of supply boats on the Liao River, which were seized and fired. The Japanese are bringing troops up the Liao River to Sin-Min-Tun on the west of Mukden.

George Frisbie Hoar

UNITED STATES SENATOR FROM MASSACHUSETTS

Senator Hoar died on Friday of last week in his seventy-ninth year, having served the State of Massachusetts and the country all his life. Belonging to a famous family, grandson of a Revolutionary officer, son of a distinguished member of Congress, ten years younger than his brother, Judge Hoar, U. S. Attorney-General, he was destined to public affairs. He graduated from Harvard at the age of twenty, was a member of the Massachusetts House of Representatives at twenty-six, of the State Senate at thirty-one, of Congress at forty-three, and of the United States Senate at fifty; was re-elected to that office for successive terms of thirty years, and he died in the fullest vigor of his mental powers.

He was eighteen years old when his father, accompanied by his sister, was sent by Massachusetts to Charleston, S. C., to test the constitutionality of a law which had taken a free negro from a Massachusetts vessel and imprisoned him. The Legislature of South Carolina expelled him from the State. It is not strange that the son, coming into manhood in the heat of the anti-slavery struggle, should have been an ardent reformer and a warm supporter of the Free Soil and Republican parties, altho he had not, like so many of those who would break up the old Whig party, joined the "Know-Nothing" attack on the rights of immigrants. Indeed, he always opposed the exclusion of the Chinese from suffrage. He was the most independent man in the Senate, sometimes, as in the Philippine question, opposing his party and yet holding loyal to it, and never losing the confidence of his supporters at home or the admiration of his colleagues in the Senate. He was known as the most scholarly man in Congress, than whom none had a keener intelligence and wit, and none a more honest moral courage. He was the most admired man in the Senate, as he was the oldest in consecutive service. He seemed to represent the choicest New England culture, and to be almost a lingering relic of the days of the elder statesmen. His equal can hardly be found to succeed him.

The Historic Resolution of St. Louis

BY HAYNE DAVIS

[Our readers need no introduction to Mr. Hayne Davis, who has contributed to our columns articles which have anticipated the memorable resolution of the Interparliamentary Union at St. Louis. These articles have attracted so much favorable attention that Mr. Davis was invited to accompany the Interparliamentary party as a guest of the Government. We give considerable space this week to the first full account of the inception and passage of this resolution at St. Louis, because we believe these events constitute a chapter of supreme importance in the world's political history.—EDITOR.]

SEVENTEEN years ago a man appeared at Washington to present to the President of the United States a paper, bearing the signature of 234 members of the British Parliament. It requested the United States to open negotiations with the British Government, for the execution of a treaty of arbitration. Until that time a treaty of arbitration was unheard of in practical politics. His mission was without visible results, and he returned to England. On Friday, September 23d, the same man appeared again at Washington, with a paper bearing the signatures of two men, the president and secretary of an organized body, composed of 2,000 members of National Parliaments, every important Parliament of Europe being represented in it. This paper called upon the United States to invite every nation of the world to send delegates to a conference, so that the delegates from each nation may (1) enter into negotiation

RICHARD BARTHOLDT

President of the Interparliamentary Union, member of Congress from Missouri, the man who has done most during the past year to advance the cause of arbitration and peace. Mr. Barthold: was born at Scheiz, in Germany, in 1855. Came to the United States in 1872.

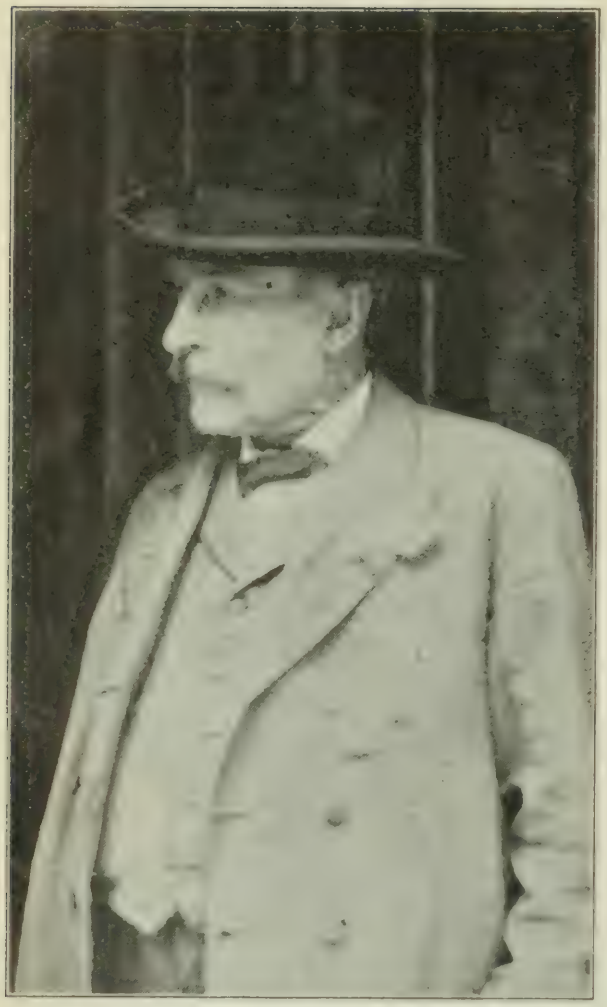
DR. ALBERT GOBAT

Secretary of the Interparliamentary Union, President of the Swiss delegation.

MRS. SLAYDEN

MRS. BARTHOLDT

The only two ladies, wives of the American delegates, who accompanied the Interparliamentary Union on their entire tour. Mrs. James L. Slayden is a daughter of Jesse L. Maury, of Virginia, who as a child knew Thomas Jefferson familiarly, and was a member of the party which escorted Lafayette from the Albemarle County line to Monticello upon his last visit to America



with the delegates from every other nation, for the execution of a treaty of arbitration; (2) may consider certain questions of common concern to all nations which at the moment are paramount; (3) may discuss the advisability of arranging for the periodical assembling of such a body for the discussion of international questions, as current events may make particular questions paramount: in other words, to constitute a working political union coextensive with our widest commercial activity. The President received the delegates of the Interparliamentary Union at 2.30 P. M. on the following day, September 24th.

Richard Bartholdt, president, and Albert Gobat, secretary of the Interparliamentary Union, on behalf of its 2,000 members, presented to the President the Resolution of St. Louis, as I shall call it. When the President said, "Gentlemen of the Interparliamentary Union, I greet you with profound pleasure," there was a slight relief of the tension of feeling. When he said, "At an early day I shall issue the call for the conference you request," there was a burst of prolonged applause. Those who were present knew that these were the first official words in the most vital chapter of the political history of the human race. They brought the paramount political problem of the twentieth century—international political organization—out of the field of academic discussion into that of authoritative action.

The President's invitation means the assembling of the first constitutional convention of the world.

William Randal Cremer is the man who has led in this International Revolution; but, as he says:

"The persistent efforts of the pioneers of arbitration would have been in vain if the great forces which are moving men in all parts of the world had not prepared the 2,000 members of national parliaments to rally around the idea they represented and form the Interparliamentary Union; nor would this organization have caused the execution of one arbi-

WILLIAM RANDAL CREMER,

Originator of the Interparliamentary Union, Secretary of the British delegation

tration treaty if the political forces of the nineteenth century had not been preparing the world for this and for the Resolution of St. Louis. Individuals may further or impede the movement which has now become official, but no man or combination of men can arrest it."

William Randal Cremer, a carpenter and plasterer, labor unionist and chevalier of the Legion of Honor, recipient in 1903 of the Nobel Peace Prize of $35,000, all of which he has devoted to the cause of peace.

Nineteen years ago Mr. Cremer entered the British Parliament by election of his neighbors, and immediately constituted himself the instrument for inducing nations to enter into treaties of arbitration. He organized the Interparliamentary Union for accomplishing this. It has caused the execution of a dozen such treaties; the opening of negotiations for countless others; the creation of The Hague Court. Its Resolution of St. Louis is designed to fix that Court permanently in its proper place as an integral part of the world's judicial machinery, by giving it jurisdiction over controversies included in treaties of arbitration, and by supplementing it with a Congress of Nations, to discover the principles of law, which the Court must apply to particular controversies.

Having been privileged to be an eye witness of the closing scenes of this most wonderful political drama, largely through the advanced thought of THE INDEPENDENT in bringing out certain articles of mine on this subject during the past eighteen months, I gladly furnish its readers with the following account of th passage of the Resolution of St. Louis at 12.30 P. M. on the 13th day of September—the first complete account that has appeared.

Mr. Cremer is without doubt the one man in the world most responsible for the existence of the Interparliamentary Union. And it has been gratifying to see the spontaneous delight with which every one has acknowledged this, and rejoiced in his presence at the memorable session at St. Louis, and the historic presentation scene at Washington.

Richard Bartholdt, on the other hand, is the one man in the world most responsible for its action at St. Louis. It was he who caused the Interparliamentary Union to convene this year in the United States; he who drafted the resolution of St. Louis, who presided at that memorable session. Other men organized and developed the Interparliamentary Union, he lead it to the execution of this its greatest work.

Since 1893, when the Swiss Republic took official notice of the Interparliamentary Union by tendering its Parliament House for the session at Berne, this Union has held all its sessions in a national Parliament House, by invitation of the Government, and under an appropriation for defraying the expense of the session.

At the session of 1903, held at Vienna, the delegates from Denmark were bearers of an official invitation and a guaranty of an appropriation for entertainment of the delegates.

Richard Bartholdt was the only member of the United States Congress who

was a member of this Interparliamentary Union. Samuel J. Barrows had joined the Union a year before Mr. Bartholdt did, but his term had expired.

Realizing that St. Louis was the place for its session this year, Mr. Bartholdt rose to the occasion and, by the exhibition of rare courage and power, secured unanimous acceptance of his invitation to convene this year in the United States, and it is just to say that in order to accomplish this he had to overcome objections raised by Mr. Cremer himself. It was suspected and suggested that St. Louis, in true American style, was trying to make a show of this august body of national lawmakers. Mr. Bartholdt asked what place in the world was more suitable for the twelfth session of this Union, born at the Paris Exposition, than St. Louis, where the greatest International Exposition ever held would be in progress, upon the centennial of one of the greatest international events—the transfer of the heart of America to the United States.

It was objected that there was no official invitation and no certainty of an appropriation for the expense of the session. To all these objections Mr. Bartholdt replied: "Say that you will come and leave the rest to me." Called upon to address the Conference in full session on the subject, Mr. Bartholdt faced the 600 national lawmakers present and presented the reasons why St. Louis was the place for the session this year, speaking first in French, the official language of that session of the Union; next in English, the language of the nation he represented; next in German, the language of the people among whom the Conference was being held. As he argued eloquently the whole house rose and gave him a great ovation. The president of the delegation from Denmark ascended the rostrum, withdrew the invitation of Denmark in favor of the invitation of Mr. Bartholdt, and the Conference unanimously voted to convene this year at St. Louis. That was a historic resolution. It was the preliminary step to what took place on Saturday at Washington. If Mr. Bartholdt had not, single handed, brought this organization to the United States at this time, the United States would not now be preparing to convene the nations in a second General Assembly, which will constitute a working political union, to include Central and South America as well as the rest of the world.

Having secured the consent of the Interparliamentary Union to come, Mr. Bartholdt went direct to the President of the United States and was commended for his action, and the President called on Congress to appropriate $50,000 for entertainment of the Union. This was done, and the President issued the official invitation promised by Mr. Bartholdt. Then Mr. Bartholdt organized in the United States Congress an arbitration group, composed of members who will enter the Interparliamentary Union and who will work for the substitution of judicial proceedings for war.

He was elected President of this group (now about 100), Chairman of the Committee of Congress to receive the delegates from abroad, and to conduct their tour of the country as guests of the nation.

Before the party left New York it was

VLADIMIR RITTER VON GNIEWOSZ.

President of the Austrian delegation, the Chamberlain to the Emperor of Austria

HONORABLE PHILIP STANHOPE.
President of the British delegation

my privilege to give out for Mr. Bartholdt through the Hearst Syndicate, of which Mr. C. J. Mar is manager, an outline of this Resolution of St. Louis which the Conference would be called upon to consider. The metropolitan papers were asleep. The wakeful papers of the West and South as usual spread this interview broadcast.

When the Conference convened at St. Louis, Mr. Bartholdt was elected President. It was he who drafted, with his own hand, the memorable resolution unanimously passed at the session over which he presided.

In that session were all sorts of men, representing every important nation of Europe except Russia and Spain. Russia has no Parliament, and as only members of national Parliaments can be members of the Interparliamentary Union, Russia cannot now be represented in it.

When the roll was called at the opening session, to see what nations were present, response was heard from Austria, Belgium, Denmark, France, Germany, Great Britain, Hungary, Italy, the Netherlands, Norway, Portugal, Roumania, Sweden, Switzerland and the United States of America.

These representatives of fifteen nations included among their number Noblemen according to the ancient standard of inheritance, Noblemen according to the modern standard of power and character, Lords and the sons of Lords, Workingmen, so-called, and Labor Unionists, Socialists, Economists, Educators, men eminent in Art, Science and all walks of life as well as in politics.

Few visionary, impractical or incompetent men get into the Interparliamentary Union by way of election to some national Parliament. The dreamers who can win in elections are men who can make realities of their ideals.

Convening for its twelfth annual session in the heart of the United States, the whole world being assembled outside the Hall of Congresses demonstrating how indispensable the nations are to each other's well being, while the people at home were groaning under the cost of past wars and the preparations for those that are expected to come, this body was

GEN. CONSTANTIN PILAT
President of the Roumanian delegation

called upon to consider the following resolution:

"WHEREAS, Enlightened public opinion and the spirit of modern civilization alike demand that differences between nations should be adjudicated and settled in the same manner as disputes between individuals are adjudicated—namely, by the arbitrament of courts in accordance with recognized principles of law;

"The Conference requests the several governments of the world to send representatives to an international conference, to be held at a time and place to be agreed upon by them for the purpose of considering:

"First, the questions for the consideration of which the Conference at The Hague expressed a wish that a future conference be called;

"Second, the negotiation of arbitration treaties between the nations represented at the Conference to be convened;

"Third, the advisability of establishing an International Congress to convene periodically for the discussion of international questions.

"And this Conference respectfully and cordially requests the President of the United States to invite all the nations to send representatives to such a conference."

MARQUIS DI SAN GIULIANO,

President of the Italian delegation, ex-Cabinet Minister of Italy

GEORGES COCHERY,

President of the French delegation, ex-Secretary of the French Treasury

Because Mr. Bartholdt was the presiding officer at this session, the privilege of presenting this resolution to the body fell to Mr. T. E. Burton, a member of the United States Congress from Ohio.

In presenting this epoch-making proposal to the Representatives of the Nations, Mr. Burton declared that the movement for the substitution of judicial proceedings for war is in harmony with the trend of events and sure, therefore, of ultimate success. Holding in his hand the recent treaty between Denmark and Holland, by which those nations agree for *all time,* to refer *all* disputes between them to arbitration, Mr. Burton said that is the ideal treaty of arbitration toward which all nations are tending, even tho all may not now be prepared to take so radical a step.

After pointing out the need of a Conference of Nations to consider and dispose of those perplexing questions which were raised at The Hague, and for consideration of which The Hague Conference expressed the wish that a future

DR. HAUPTMANN, President of the German Delegation

ERNST BECKMAN, President of the Swedish Delegation.

DR. TYDEMAN, President of the Delegation from the Netherlands

DR. JOAO DE PAIVA, the "Passy of Portugal" and Sole Representative of Portugal at the Conference

HOUZEAU DE LEHAIE, President of the Belgian Delegation, Senator of Belgium

M. V. KRABBE, President of the Danish Delegation and Vice President of the lower house of Denmark

conference be called, Mr. Burton came to the establishment of an International Congress, to convene periodically for discussion of such international questions as current events make paramount. He said these questions are assuming such great importance that a full and free discussion of them and of the means of

COUNT ALBERT APPONYI,
President of the Hungarian delegation and Privy Counsellor of Hungary

securing amity among nations is essential to the welfare of every nation. And an International Congress in which every nation has representatives is the only way of securing such a discussion.

After the applause of Mr. Burton's very able presentation of this resolution had subsided, there was a considerable pause before any delegate addressed himself to the grave questions contained in the resolution. Then Count Apponyi rose. In a few remarks as notable for their simplicity as their power, he took exception to one remark made by Mr. Burton—namely, that all consideration as to particular nations should be put out of sight and only the general welfare of all nations be kept in view. He said he was heartily in favor of everything else Mr. Burton had said, and of that idea also as a general proposition. But that there were good reasons why the United States should be specially kept in mind in the movement for international justice, contemplated in this resolution; special reasons why the President of the United States should be the one to call the Conference to carry on the work begun at The Hague Conference. Because the United States was the first to prove its confidence in that Court as a needful and useful part of the world's political machinery by resorting to it for settlement of the long-standing controversy with its neighbor, Mexico; and because the President, to his own personal honor and the great glory of this nation, had induced the nations of the world to refer

JOHN LUND,
President Norwegian delegation, Vice-President Nobel Prize Commission, ex-President Norwegian Parliament

the controversy with Venezuela to The Hague Court, even after hostilities had actually begun; because, also, the United States is the great representative of Democracy in the world, and Democracy is peace, being government by the people, and the people having no greater interest than peace; and because this

resolution calls for the application of the fundamental idea of Democracy to international affairs by the constitution of a Congress of the Nations in which every nation shall have representatives, for discussion of those interests which are common to all nations.

When Count Apponyi took his seat it was evident that this resolution would be carried. There was a hush in the Hall of Congresses such as comes over an assembly when on the verge of a great action.

Then Dr. Gobat, of Switzerland, rose and pointed out that this motion was the heart of all their plans, because it led on to international organization similar to national organization, such as was seen in this nation, in Switzerland, in all the nations created during the nineteenth century. The political process of that century was the union of contiguous States so as to form one body with many members fitly joined together. The discoverers in the scientific world had learned how to bring these Federated States into closer touch with each other at the beginning of this century than the constituent States were when they were drawn into union with each other during the nineteenth. Therefore it is not Utopian to say that similar political organizations, on a larger scale, can be created: for instance, a United States of Europe, or a United Nations of the World. As a Court for applying principles of law to controversies between nations issued out of The Hague Conference, so a Congress or Parliament for discovering those principles of law can issue out of such a conference as is contemplated by this resolution, thus making more perfect the international organization constituted by the treaty of The Hague.

Such a General Conference or Congress of the nations would begin by meeting periodically. It should appoint a committee of its members to be continually in session, in order to see to the execution of its resolutions, to overlook the observance of arbitration treaties, to use its influence to cause the reference to arbitration of such controversies as may arise which were not foreseen or provided for by the treaties, etc. If the conference contemplated by this resolution can accomplish these things, our Union will indeed have initiated the movement for proper political organization of the whole world.

Dr. G. B. Clarke, of the British delegation, suggested the withdrawal of Sections 2 and 3, not because he was opposed to them, but because he thought the settlement of the questions raised at The Hague was all the conference to be convened would find time to accomplish, and the other two works could be undertaken by other conferences. He said The Hague Conference had adjourned without acting on the questions because there was not time for it.

His suggestion, however, was overcome by a few words from the Marquis di San Giuliano, of Italy, and Mr. Stanhope, of England, both of whom remarked that this resolution had been carefully considered by the Executive Council, and been still further considered by a sub-committee composed of Mr. Burton, of the United States delegation; M. Houzeau de Lehaie, of Belgium, and Mr. Stanhope, of Great Britain, and that it was believed to be acceptable in substance to every member of the conference. They both emphasized the thought that if this were true, it should be adopted unanimously and without amendment, because in this way the main purpose of this body would most surely be effectuated.

The resolution was then adopted unanimously half an hour after noon September 13th, 1904. Thus the most important and far reaching political movement ever attempted was brought out of the field of discussion and into that of action. This resolution is designed to bring Central and South America into the defective union created by the treaty of The Hague, and to take great strides forward in more perfectly constituting this union of nations. It is analogous to those crises in national life when nations were constituted, or when constitutional provisions of prime importance were added to existing national organizations. They affected directly a part of the world. This affects directly the people of the whole world.

New York City.

The Most Interesting Historical Play in Europe

BY E. I. PRIME-STEVENSON

IT was in the year 1631, a year of blood, storm and fire for Central Europe, as then was the fate of Northern Europe also—the ebb and flow of the religious and military issues of the Seven Years' War. General von Tilly, that bluff type of soldierdom in his day, smarting from his unexpected defeat by Gustavus Adolphus at Breitenfeld, came before the walls of Rothenburg-on-the-Tauber to aid with his large forces and personal presence the taking of that modest yet important stronghold. Rothenburg had been attacked already, fiercely but vainly, by Tilly's Catholic coadjutor, General Ossa. The little Bavarian city was not only exceptionally fortified—as we see to-day—but full of brave and war-experienced citizens. Yet what could they and their handful of Swedish allies do against the cannon of Tilly and Ossa, against Pappenheim and the Duke of Lorraine, along with an army of nearly twenty thousand professional fighters? On the morning of the thirtieth of October Rothenburg capitulated.

Perhaps never in all his career was Tilly more enraged and revengeful than through this experience. A tiny town—a few hundred Protestant burghers—needing a fierce siege of several days and a considerable loss of some of his best troopers to bring it to his hands, if not to his theology! Tilly swore to hang the whole Rothenburg Town Council and to turn over the town to plunder. His entry up the broad street to the then new City Hall, where the keys would be tendered

View of Rothenburg Along the City Wall

Ancient Tower on Wall, Rothenburg

him, was amid a population on their knees Despairing women held out their hands to him; old men bowed, imploring, and children wept. Sitting in the superb Town Hall, Tilly received the subjection of a trembling Council and the keys, and bade the whole embassy to be ready in an hour for death as heretics and rebels. The wives and daughters of the condemned threw themselves at Tilly's feet, invading the hall against his express order. He ordered them away The executioner was ready, when—so runs the tale at least, and woe to the Rothenburger who disbelieves it!—a remarkable diversion occurred. In a sort of bitter jest, Tilly—who had become somewhat less truculent after a long draught of wine from a huge glass loving-cup that had circulated between him and his staff—declared that he would spare all Rothenburg if one of the rebellious Lutherans before him would show himself enough of a man to drink out at one draught the tankard that towered before him on the table The ex-Burgermeister, Georg Nusch, was not only a man of great piety, but also one mighty in capabilities with a beaker—in this case a fortunate combination. He stepped forward. He made Tilly repeat the promise. He prayed a short prayer and began a long draught indeed, for the "hummer" held several quarts of strong wine. He drained the tankard, tendered it to Tilly, answered a question—and then fainted, or, at any rate (and not to be wondered at), he required support, as well as received plaudits so long and loud that Tilly had no alternative. Tilly kept his word. The citizens and Rothenburg came off scot-free. And it is said that grim von Tilly himself took part in divers festivities, then and there established and known as "The Graeing of Rothenburg," by his better humor, and by ex-Burgomaster Nusch's high—no, deep—comprehensiveness and pluck.

Some few years ago, when the present strong tendency in Germany toward celebrating local events by local dramatic portrayals of them was more novel than now, the city of Rothenburg decided on commemorating the foregoing history by

a simple drama as an addition to the already long, long established anniversary procession and exercises that had become a "feature" of one of the most picturesque and attractive old cities of Bavaria. The plan was carried into execution with immediate success. It has now become a set event of each successive Pfingstmontag (Whit-Monday) in Rothenburg. From all parts of Central Europe, and from much remoter ones, guests come to it, quite taking the old town by a storm much more acceptable than that proposed by Tilly. It is adding not a little to the interest of a place overflowingly interesting to the traveler, who needs no such "occasional" reason for allurements.

I have seen this performance several times, and, after a long and pretty exhaustive acquaintance with all sorts of historical plays, Passion plays, hagiographic plays, legend plays and all manner of other plays, between one side of Europe and the other, I have no hesitation in pronouncing the Rothenburg "Tilly in Rothenburg" the most attractive, realistic, dramatic thing of the sort yet offered the public. Rothenburg is well worth a visit without it; the medieval Germanic aspects of Nürnberg, or even Dantzig, are far less coherent and rich. But with the play on, no traveler in the neighborhood of Würzburg should let the annual spring recurrence of the affair pass without lending his ears and eyes thereto.

For the interest and individuality of this Rothenburg performance roots not in the fact that the drama itself is an exceptional matter in having a stirring military atmosphere, nor in possessing a specially dignified central climax—which certainly is not the case here, inasmuch as the chief episode has quite as much to do with Bacchus as with Mars—nor that we find a piece of unusual merit in its construction or diction. The play itself is short—one act—and not extraordinary, tho it is a well written matter of an hour or so. No; the striking quality of the Rothenburg play comes from the fact that, outside of the actual casting of *rôles* and their delivery—for the most part admirably sustained—one does not quite realize *where reality ends and stage begins;* where we are busy with illusions and where we have before our eyes—yes,

Archway and Tower

our ears, too—the very thing itself! This curious outcome is to be better understood from the following instances:

To begin with, there is not any theater. Or, rather, just as when Tilly attacked Rothenburg in 1631 the whole town, inside and out, was the theater of action, so to-day Rothenburg itself is made the scene; such from gate to the

Old Clock Tower, Ancient Houses, Rothenburg

table at which the stern victor sits, when, striking his fist on it, he exclaims:

"So sollt Ihr All' in Eurem Hochmuth sterben!"

And just so, instead of merely a few actors, all Rothenburg is more or less the acting-personnel! Rothenburg itself is a miracle of preservation as to its every aspect and detail of the historic days in question. When the piece was prepared its authors purposed to take full advantage of the fact. So, in the morning, the guest in Rothenburg is roused from his peaceful twentieth century slumbers by a roar and clangor and thunder, and by woful street sounds that are enough to frighten him out of his bed. What means this? Why, merely that to-day again the cannon of Tilly are thundering outside the walls, and that the citizens to-day are manning them, as in 1631, for the last orders, and that to-day, as in 1631, are they replying to the fire, and sounding the church bells amain to draw the defenders together. Some of those cannon, and many of those bells, are the same cannon, the same bells that were so alarmistic on the real day of capitulation, and the iron tongues are ringing in the same towers, almost to a stone, that they clanged in in 1631. You look out in the street. Have you not got back to the seventeenth century, in truth? For yonder are men in armor, running to the main gate; women in the dress of the Bavarian citizenesses of that time, in their various classes; even children in their proper habiliments of quaint days. When Tilly makes his entrance (a part, by the by, thoroughly well taken by one of the most respected and energetic promoters of the piece) the personifier of

that revengeful leader and his noble staff ride into Rothenburg through the same gate that their prototypes passed. Followed by a long line of armed and dusty veterans, they proceed by the same streets to the same square. They near the same stately Rathhaus whither Tilly and his cohorts directed their steps in 1631. At the entrance the present-day Tilly, Lorraine, Count von Aldringer, Pappenheim and the rest halt; while about them, in the bright sunlight, are kneeling the citizens, just where their forefathers knelt some two hundred and fifty years ago. What is more, not a few of the actors in the fictitious scenes before us, as the play develops, are lineal descendants of the men and women whose names they assume in the play. Not only that; they are wearing clothing, ornaments, weapons which belonged to those very individuals. No wonder that a friend of mine exclaimed, "Well, if this mixture of real and unreal goes much further I shall go to bed bewildered out—with a sick headache—or get under the bed with a fit, for fear the town is to be burned down over our heads!" And, really, only by some such parallels as might occur in the good old Italian carnival days, when it seemed as if a whole town became mask, and unreal life the breath of the hour, can one find even a half way comparison. Hardly that; for between a carnival, with jiggings and gala-shows, and this Rothenburg, with the bells sounding their most dismal, and a weeping populace begging for their lives at the stirrup of a bloodthirsty invader, there's not a strong affinity.

But let us stand within what is the nearest approach to the formality of an inclosed theater—the spacious old Rathhaus. Its largest hall is hung with

". . . old banners,
Of old achievements, after all manners."

I have known what it is to be thrilled with the sudden artifice of many a stage-play. But I do not know that I have ever found an emotional effect in drama so vivid as comes here, when, after the sortie of the last possible contingent of the city's defenders, after the coming and going of messengers before the pale and solemn group of councillors on the platform at the upper end of the room, the tramp of the main escort of Tilly, Ossa, Pappenheim, Lorraine and Adlinger is heard in the passage, while from without the cry of the town suddenly is lost in a direful and suspenseful silence. Once again, the mixture of truth and artifice, for Tilly and his company stride up the same stairs, through the same vestibule, into the same hall, to the same corner of it, and there Tilly sits himself down in the same chair and puts his hand on the same table that stood there in the day of Rothenburg's real humiliation and danger! Tilly's outburst of wrath follows, to which even Pappenheim dissents as he says to his chief:

"Nay, hang them not, as thieves are served!
Like men
Full bravely have they fought it out! Instead
Give them their choice—a bullet or the sword!"

With that the niece of the Burgomeister Bezold makes her desperate and vain plea. And to this follows the offering of the huge cup of wine to Tilly, and his encomium as it has passed the rounds:

"Respectable indeed, a cup like that!
Lord knows it! Why, half-full, as now it is,
Your puny Council could not drain it out!
Drink ye, my soldiers! Gentlemen, 'twere
shame
Seven generals returned it with a drop!"

Thereupon ensues the climax of the piece. In reply to Tilly's challenge Georg Nusch raises the cup. Nusch drinks—drinks—drinks!—while on the stage and in the audience there could be no stronger atmosphere of, first, incredulity, then hope, and, finally, acutest suspense. Tottering and dull-eyed, but knowing well what he is about, Nusch finally sets down the empty beaker. Tilly starts up:

"By God above! The man has drained it—
all!
What is thy name?"

And the ex-Burgomaster answers without a hiccough and stedfast enough to be able to hand Tilly the empty glass:

"My name is Nusch! Here, General, take
the glass!
But keep your word!"

To which Tilly, with a stern smile, bowing his head, answers, addressing the group of reprieved citizens:

"I keep my word! Be free! And, too, forget
not

That Tzerklás Tilly drank your wine with you,
And held a death-court also in your hall!"

—and, with that, as the chorus burst out into a jubilant song, the bells of Rothenburg ring their loudest, and the cheers of the citizens rise from the street as the audience files out. By the by, till lately the original cup, which Tilly found so "respectable" in capacity, was used. An imitation now takes its place. The other is carefully preserved—a sort of "Luck of Rothenburg."

The effect of the whole performance is, as I have said, unique. To it succeeds, however, a remarkable triumphal-historical procession through the city streets, when everything that Rothenburg can produce of the miltary-antique is on display. A general festival ends the day—a lively picnic, held in the deep, grassy moat of the town, from which no cat or dog, to say nothing of men, women and children, that abides in Rothenburg willingly stays away, the participants in the play and procession retaining their costumes and many others being donned by non-participants.

Rothenburg itself, especially in the spring or autumn, can hardly be approached as a setting for any such picturesque and military an incident. Double-walled and moated, with many of the fifty towers that shot up of old still standing—the inexhaustible variety of its patrician or less aspiring architecture, with which its streets overflow—the countless sculptured gables and façades, fair old fountains, the spiral stairways and carven balconies—all these are part of the daily real picture of its past, not merely stuff of canvas and paint of a theater. And around the town stretches one of the loveliest of Bavarian landscapes. In June it is a countryside of the richest verdancy—shaded expanses and emerald meadows, where the nightingale or the lark, as one wills, can be chosen by the nature-lover and bird-lover. The landscape over which Tilly and his forces marched to the town-wall has probably changed little in the course of what is, after all, a short time for history. The march of decades has made Rothenburg grayer, while, to the casual eye not yet decrepit. But wars for creeds and catechisms, the fierceness of religious sectarian passion, the sword drawn that souls should be warned and saved—

Municipal Building

The Lower Gate, Rothenburg

let us be thankful that a wider and saner idea of propagating ideas as to the future world of one sort or another has come, and has come to stay; and that while wars never will surcease, neither Rothenburg nor any other European city is likely to be put to siege by an army corps for the sake of merely its religious affiliations. Sieges on account of creeds and dogmas are of epochs no more, and no modern conquerer is likely to propose and to exact as bibulous and frivolous a feat in the way of rescue as that accomplished by pious and capable Georg Nusch.

ROTHENBURG, BAVARIA

Leaf and Root

BY THE LATE SAMUEL WILLOUGHBY DUFFIELD

A LEAF fell from the tree,
And the wind blew it along;
It was so like to me
That I put it into my song.

I said—the leaf was a part
Of the branch and the bole and the root;
It felt the pulse of a heart—
It brushed the cheek of the fruit.

But the life of the leaf is lost;
It falters along the ground;
Beaten and broken and tossed,
No refuge nor rest is found.

Go back to the earth, O Leaf,
Go back and hide in the sod.
Thine exile is but brief;
Go back to the root—to God!

Politics and Pens in England

BY JUSTIN McCARTHY

THE political reaction in this country is still running its course. How far it has been able to carry the country along with it we shall not be able to know until we have the General Election. The General Election might, indeed, come at almost any time. Some of our politicians are full of the belief that it will come within the present year, but the more general opinion is that the Government will put it off as long as possible, in order to give a better chance for the intervention of some great political event which might turn the public attention away from the protection policy of Mr. Chamberlain. Our system of General Elections in Great Britain and Ireland is conducted on a very haphazard and irregular sort of plan. The constitutional principle is that a General Election must take place once at least in every seven years—that is to say, no Parliament is to last for more than seven years from start to finish. But, then, it is a settled usage in our Parliamentary practice that no House of Commons shall ever be allowed to keep together for the seven years, and, indeed, Mr. Gladstone and others of our political leaders were strongly of opinion that no House of Commons should be allowed to sit for more than about six years at the farthest. It is, however, agreed on both sides that Parliament may be dissolved at any moment when the Sovereign and the Government find it needful or desirable to give the constituencies a chance of electing a new House of Commons.

The Conservative Government, therefore, have it actually in their power either to dissolve Parliament at once or to let it run its course for some sessions to come, seeing that this present Parliament only came into existence with the opening of the year 1901, and is, therefore, still far removed from the period of its inevitable dissolution. Meanwhile, however, the reaction against the political principles of the present administration is still going on and is likely to continue. Now there is undoubtedly such a phenomenon in our English public life as a season of reaction. Some political party has achieved a great triumph, accomplished a great reform, and for the time the majority of the voters in the constituencies are carried away by the enthusiasm of the new principle and the new success. But, then, after a few years have passed away it sometimes happens that people begin to grow quite accustomed to the new state of things, get rather weary of the enthusiasm it has awakened, and first a feeling of exhaustion and then a feeling of reaction will begin to spread abroad and some new political program will be welcomed by many for the sake of its mere novelty. The Conservative administration now in office undoubtedly came into power by the force of that reaction which had set in against the splendid succession of reforms carried through by such statesmen as Gladstone. Now, in return, it feels more and more the avenging effects of that system of reaction which first made it and now threatens to unmake it.

In addition to this influence, however, it must be said that the Conservative Government is suffering from other influences of a very damaging kind as well as that of mere reaction. The complaint made against them even by many of the stanchest Conservatives is that during recent and most critical seasons of political movement they have never proclaimed any definite policy of their own, but have now seemed to favor Mr. Chamberlain, and now seem to go in with the Unionist Free Traders. Mr. Chamberlain withdrew from the administration because he suddenly found out that he was a Protectionist, while, on the other hand, some of the ablest and strongest Conservative statesmen who were members of the administration when it came into office, men like Sir Michael Hicks-Beach, Sir John Gorst and Mr. Ritchie, resigned office because they could not be Protectionists, and because the Prime Minister and the Government as a whole could not make up

their minds whether they were for or against Protection. The reaction, therefore, now is against Mr. Balfour's Government, and they have to contend as well against the important secession among those who until recently were their followers. Almost all the "bye-elections," as they are called—elections, that is to say, caused by the death or the retirement of a member—have told distinctly and effectively in favor of the Liberal Party. Under these conditions it is easy enough to understand that the Conservatives in office might think it well to hold on to office just as long as they can and to keep their opponents out of power in the vague hope that something may turn up in the meantime to diminish the chances of the Liberals and rally the Conservative electors into a cohesive body once again. So far as Mr. Balfour himself in concerned I do not believe that he has the slightest personal desire to cling to office, and I feel sure that in any postponement of the General Election which may take place he is considering much more the inclinations of his party than any interests of his own. The one thing which may be taken for granted, so far as human foresight can judge, is that unless some almost miraculous change is created in public feeling the General Election must bring about the return of the Liberals to power.

JAMES LOWTHER

One of the most remarkable figures in English politics and in English sporting life has just passed away in the person of the Right Hon. James Lowther, or, as he was habitually and familiarly designated in the House of Commons and by the outer public, "Jimmy" Lowther. Mr. Lowther was, indeed, the type of a certain British order which is soon likely to be wholly extinct. Such a character as his might have found an appropriate place in one of Fielding's novels or one of Goldsmith's comedies. He was a Tory of the Tories, a man who never could have changed his convictions on political subjects, with whom, indeed, convictions might be described as instincts. No matter what changes might have passed over the general opinions of his party on this or that important subject, Lowther remained ever a firm and fixed Tory of the old and now almost forgotten school. He continued to be an avowed and unalterable Protectionist in days when there was no other Protectionist in the House of Commons and when Joseph Chamberlain had not yet ceased to be a Radical of the most Radical order. Yet there was no man more generally popular in the House than "Jimmy" Lowther, even among the Irish Nationalists, to whose movements and whose doctrines he was an uncompromising opponent. When Disraeli created him Chief Secretary to the Lord Lieutenant of Ireland—a position which makes its occupant the real Governor of Ireland—the appointment was generally regarded as a sort of practical joke perpetrated by the great master of sarcasm. Lowther, of course, carried out in his Irish administration the severest measures of coercion, and yet he never came to be the object of personal dislike, even among the Irish Nationalists. Everybody knew that in whatever he did he was following out his own sincere convictions, and that he never sought to gain any personal advantages by his course of official action. He was a gentleman, and he had a bright, genial, familiar way which secured him

a welcome even among his most extreme political opponents. In the world of sport he was one of the most distinguished figures on English soil, and, indeed, was well known as a leader and ruler of sport in every country where horse races are run and where the winning post is looked to by eager eyes. Here, again, was found in him a quality thoroughly characteristic of the man. In the world of sport he conducted himself on the most absolutely honorable principles; he was the *preux chevalier* of the turf. He never, I believe, made a bet but once, and that was in the very earlier part of his sporting career, and from that time forth he regarded the race course merely as a noble field for the promotion of strength and skill and courage among men and horses alike and not as a field for the making of money. I had the honor of knowing Mr. Lowther for many years in the House of Commons, and I am bound to say that our extreme and absolute difference of opinion on almost all political subjects never interfered with the geniality of our personal intercourse. It might almost be said that an era in England's social life has come to a close with the death of "Jimmy" Lowther.

From the field of politics I pass not unwillingly to the field of letters. We have lately had some remarkable literary publications. One of these is entitled "The Masters of English Literature," by Stephen Gwynn, a volume given to the world by Messrs. Macmillan, of London and New York. The name of Stephen Gwynn is, I think, already well known to American readers because of the part he has taken in literary works prepared with a view to the popularizing of English literature among all classes in the United States. His new volume is, in fact, a series of essays which tell in brief the whole history of English letters from before the days of Chaucer down to the close of the Victorian era. Mr. Gwynn's description of each British author is accompanied by the most appropriate selections illustrating the author's purpose and his style. Now, of course, it would be a comparatively easy task for any one who gave his mind to such studies to put in form a concise and consecutive account of all the great English schools of literature from the earliest days down to the present. Mere industry and patience combined with a knowledge of the books under review could accomplish such a task in form quite good enough to make it a valuable addition to every library. But Mr. Gwynn's book is something much more and much better than any mere compilation of the kind could possibly be. He is a genuine critic and a critic of a very high order. His feelings and his judgment penetrate to the very heart of every subject on which he discourses, and while he can glow with an admirer's fullest enthusiasm he is never carried away into the extravagance of adulation and never allows his mind to be filled with the idea that the author whom he regards as great must be equally great in everything. The chapters of this volume make, indeed, the most delightful reading, even if we were to regard them as nothing more than the means of passing some happy hours of indolence. But they are, in fact, critical studies of a very high order, studies which are not often to be met with in our days of rapid reviewing. The extracts are always appropriate and illustrative, and tho each is necessarily but short, yet it is always completely typical of some characteristic mood or fancy in the author. The attempt to give us a clear exposition and illustration of English literature through its whole course thus far might seem, indeed, a very venturesome enterprise, but I think I may say with confidence that allowing for the necessary limitations of space and time it has in Mr. Gwynn's hands become a complete success. It may interest my Irish readers to know that Mr. Gwynn is by the mother's side a grandson of William Smith O'Brien, the leader of the Irish rebellion of 1848.

"My Memory of Gladstone," by Goldwin Smith, a volume just published by Fisher Unwin, is a book which also deserves some special notice. Goldwin Smith, who now lives far away from English political life, at "The Grange," Toronto, Canada, was at one time, and that not long ago, a very striking figure in the intellectual and political movements of England. He was an advanced Liberal in his opinions on most of the great political subjects which drew him into discussion, but he was never the man who could settle down to be a mere obedient member of any political party. I

need not, however, make any attempt to describe the career of Goldwin Smith for the benefit of my American readers, seeing that he is quite as well known in the United States as in England, and was at a period not far distant Professor of English and Constitutional History in the Cornell University. Goldwin Smith is one of the men whose memories of Gladstone would most naturally arouse the interest of American as well as of English readers. Goldwin Smith had in him always a certain quality of intellectual antagonism which would not allow him to become an unqualified hero-worshipper in any instance, and there were one or two important questions on which he could not accept Gladstone's leadership. But there were many subjects on which the two men fully agreed, and Goldwin Smith was brought during many years into frequent and intimate association with Gladstone. The condensed results of this long association are given in this small volume with an insight into character, an appreciation of great and noble qualities, and what I may call an artistic admiration for intellect, eloquence and sincerity, which has ever been one of Goldwin Smith's especial characteristics. I could not profess to agree always with Mr. Goldwin Smith's judgment as to this or that quality of Gladstone's intellect or as to this or that course taken by him in political life, but I have no hesitation whatever in saying that Mr. Goldwin Smith's tribute to the memory of Gladstone does honor alike to the man who offers it and the man to whom it is offered.

LONDON ENGLAND.

Creative Farming

BY E. P. POWELL

AUTHOR OF "OLD FARM DAYS," ETC.

AGRICULTURE and horticulture are the highest employment of human beings; for this reason, that they place us in line with creative effort, or, as we like nowadays to say, evolution. Evolution is the lifting of low forms to higher, and you will be astounded to see how much of this can go on on your farm. In the barnyard it is constantly manifesting itself in animal life; in the orchard in the production of new and better fruits; in the garden in better vegetables, and on the flower lawn in nobler roses, pinks and dahlias. A little careful watching will show that forest trees are all the time readjusting themselves to modern life; some of them degenerating and some of them progressing, while others are still in the puzzle as to which way they shall move. There is not a tree, a person, an animal, or a weed in a state of equilibrium. Even the insects that are our worst foes a few years ago were harmless residents of forests or steppes.

Before I show you some purposive efforts of my own to direct evolution, let me show you some points where nature invites us to put forth our effort. There is not a pure blooded seed in existence. Every one carries a mixed blood—what we call cross of two or more parents. Where bees are kept the probability is that there are many crosses in the same pod of seed. The tendency is to express purely animal or vegetable propensities. Ninety-nine apple seeds will produce what seems to us to be retrogression. These will occupy the world with vigor, if man is not present to eliminate the merely physical strength, and give quality preference to fecundity. Degeneration, as we see it, is not always such from the standpoint of physical nature. It does not always mean dropping down in the scale of existence, and going out; but

dropping to a lower level of effort, where the plant or the animal can have a better chance to succeed in the struggle for existence. That is just what is going on with the insects and the plants about us, as well as with ourselves. Snakes once had feet, and if they had kept them they would have been overwhelmed with the rest of the saurians. They took to their bellies, and have competed so successfully as to make a decided factor in the world's life. The bedbug was once a winged insect and had a hard time of it; it dropped down to a lower level of existence, aborted its wings, adopted new habits, and competes altogether too successfully. Wild apples, wild plums and wild pears show this tendency to drop down, or to drop down in their relation to civilization. Left in a wild state they would probably succeed better. We have to select, and keep on selecting and rejecting the least valuable, from our standpoint; and in that way we keep the fruits and the cereals in pace with us, and progressing from our point of view. Man attacks all forms of evolution, and insists that whatever he desires shall conform its development to his own. The result of this work is that our gardens and our barnyards are civilized to higher degrees of physical qualities in every generation. We have vastly better fruit, better grapes, better pears, as well as better horses and cows, than we had one hundred years ago. The end of this work will be, in the animal kingdom, something better than fat pork, swift horses and rich milking cows—we shall have an increase of intelligence as well. The reign of peace and good will will take in our whole realm in due time. In the vegetable world the end will be usefulness and beauty, which is the physical expression of moral character. In other words, we are all moving together toward an intelligent world.

One need not see all these things when he first begins to co-operate with nature, but he will see more as he progresses. In other words, to create things recreates ourselves. When I began my work in orchard and garden I began in a very simple way and with very little comprehension of the full nature of the problem. One of my first attempts was to improve the gladiolus. This was undertaken in the sixties, when this flower was just stepping out from its simplicity into the gorgeousness of multiplied varieties. I succeeded in securing some very choice seedlings, but I learned more lessons than I obtained direct results. One law was very interesting, and that was that the simpler and coarser crosses blossomed in two years from seed, while the more complicated and beautiful did not come to florescence until four, or even five, years. In my vegetable garden I had growing six sorts of beans. The white wax bean had just come into general use, but it was rusting badly. This wakened an ambition to produce, by careful crossing and selection, new varieties of even better quality, and rust-proof. Up to the present time I have developed over three hundred crosses, most of them of little importance. The least valuable were promptly thrown away, while the better were experimented with for a few years until their limitations were determined. Each one of them showed that the mixed parentage was ready to develop, on either side, into what we call "sports." In other words, one has in all this work not only to originate new sorts, but to settle those varieties into stability which he wishes to keep. The lima bean proved to be exceedingly conservative and refused to marry with common beans. However, after a while I secured lima crosses, with some very superb results. The most striking success was that of modifying the old horticultural or cranberry bean. This bean, originally a striped bean with a striped pod, I have now with a striped pod and white bean, and a striped bean and white pod; both pod and bean white, and with this pure white color a solid pod. That is, mainly by selection, I have secured such changes as I desired in a standard bean, making it more available for the table and richer in quality. The beauty of these beans, as they hang on the poles, is unequaled. Of all my crosses the finest is one between the horticultural and the lima. This is very solid, with pod and bean both white, and so rich that the pods look oily on the poles. We were able to develop pods over ten inches long and three inches around, with ten beans to the pod. All these were ultimately thrown away, as badly adapted to the market. The ideal bean is six or seven

inches long, a straight pod, pure white, or brilliantly colored, and quite round or solid.

An accidental cross of Blount's Prolific corn with a variety of sweet corn started me on a series of experiments that in time became very interesting. Among these crosses I obtained varieties of exceeding sweetness, while the ears stood as high as my head, and two to a stalk. Finding among these a reversion that carried the ears to the top of the stalk, I concluded to bias my experiments in that direction—at least to see what would come of it. You are aware that nature moved her seed in the case of corn down from the flowers, which are at the top of the stalk, to the leaf joints, where the heavy ears could be easily supported. These shrewd movements on the part of nature are extremely interesting, but there is always a slight tendency to reversion. In this case I took the reverted seed, and in the course of two or three years obtained a variety of corn standing about four feet high, and nearly every ear at the top of the stalk. These ears came in clusters, and, of course, bent the stalks over to the ground. I next began to plant the very smallest kernels of the very smallest ears. In about four years' time I had obtained a grain standing not more than two feet high and very closely resembling in its stalk a coarse grass. The grains of seed did not differ largely from the oat or wheat in size. I showed this result to Prof. C. V. Riley, of the Entomological Bureau at Washington. Unfortunately, the mice got at my seed and ate every kernel.

All this while experiments crowded, and the most interesting only could be pursued. I have preserved the most select varieties of my beans, but in one way or another have lost nearly everything of value in corn. Evolution with seedlings in general is a very simple matter. I believe that every farmer would find it profitable, from an intellectual standpoint, and for the influence upon his boys and girls, if he would enter upon more or less of experimental work. Among my currant seedlings, selecting only the seed of the best Versailles and White Grape, I found one, a few years ago, that stood seven feet high, admirably stout and well formed in limb growth, and with fruit the size of Fay. There was no gain at all in the size of the fruit, or in its quality—this was simply up to the highest notch of past achievement; but the bush was one-third larger than Fay or Versailles, and capable of carrying an enormous crop. This variety I placed in the hands of a nurseryman, to be ultimately given to the public. I have had the same good fortune in gooseberries, securing a beautiful crimson that ripens about the first of July, and another berry of excellent quality that ripens about the middle of September. These two berries prolong the gooseberry season by at least a month.

I imagine that most farmers will be likely to turn their attentions to the improvement of cereals or vegetables, and many are at present making decided improvements along these lines. Think of the immense strides since Mr. Goodrich sent out the Garnet Chili, the Cuzco, and Calico potatoes, followed soon after by Mr. Brezee's Early Rose. I find frequently among my neighbors seedlings that ought to be preserved and distributed. Many of our very best fruits are such chance seedlings, preserved by some man capable of appreciating their value. Meanwhile we are losing hundreds of other choice fruits, simply because they are never brought to the attention of the public. I do not recommend that an ordinary farmer undertake cross breeding of apples and pears, simply because it takes so long to determine results. It also takes more space for testing new trees than can be afforded. We shall have to leave this sort of work mostly in the hands of such specialists as Mr. Burbank, of California, and Mr. Munson, of Texas. Almost equally valuable are such enterprising firms as that of Stark Brothers, which stand ready to take up any fine achievement and make it pecuniarily profitable. Mr. Fay realized over $20,000 for his new currant, the Fay; and this mainly because he had the good fortune to find in Mr. Joscelyn a nurseryman capable of appreciating what he had accomplished. Mr. Burbank has hundreds of acres devoted entirely to this business of guiding evolution. In one year he had in growth ten thousand hybrid lilies. Every year he sends out more or less new plums, new peaches,

new apricots, new vegetables and new floral wonders. His farm is a vast laboratory, out of which are turned results quite as important to the happiness of mankind as those which come from the laboratory of Mr. Edison.

What is to be the final result of all this human co-operation with nature, and this oversight of brains, who can tell? Within the memory of those now living the Concord and Delaware grape began a new era of vine growing, and the Bartlett and Sheldon pears led the way into orchards where the number of varieties became simply bewildering. I have now growing a large number of grape seedlings, among which there appear so many of excellent quality that I am tempted to plant quite beyond the limits of my acreage. We shall surely be able to widen the grape season two months, as we already have that of the plum. We are determined to have a good American raisin grape. We want a thorniess blackberry, absolutely hardy and as rich in quality as Eldorado. Why not? The blackberry no longer needs protective barbs any more than its cousin the raspberry. Then in all directions we want berries and fruits with fewer seeds. In wild nature this productiveness and power to reproduce was the one essential point; under man's guidance and care it becomes the least important. The strawberry is big enough, and sweet enough, and prolific enough; but the ideal strawberry must have all good points in one, and it must have roots that defy drought. The ideal gooseberry is very nearly here. The ideal currant will be as big as the gooseberry and the bushes will stand eight or nine feet high. All the time the joy of it is that perfection can never be quite reched, but improvement always—exactly as it is with human character and human society.

We do not expect every great product of our efforts to become famous or even generally useful. The prime end of our work is to interest and improve ourselves. It lifts agriculture from the level of drudgery and inspires everyday toil with interest and pleasure. It is impossible to describe the delight with which we contemplate the approaching fruitage of some new plant. My grapevine and seedling plums give me a few new sorts to watch, to test, and to enjoy each year. Then comes in the new fellowship—the associated interest of those who exchange notes and then swap plants. I receive the achievements in grapes and mulberries of such men as Munson, of Texas; in strawberries of Crawford, of Ohio, and Thompson, of Virginia; of E. Y. Teas, of Indiana, in hybrid catalpas and other choice trees; of Stark Bros., of Missouri, in new pears and apples—and so there grows up a co-operative community, and we touch hands across the continent. The time will come when this family will take in every farmer of the United States and every owner of an acre of land.

I have confined myself mostly to achievements in horticulture, but they are just as great in general agriculture. Our varieties of wheat have been multiplied by hybrids or cross-breds, and selection has carried us very far ahead of the varieties cultivated fifty years ago. The same is true of corn, and potatoes, and oats, and barley. Just now more attention is being paid to the selection of seeds than to the originating new varieties. Professor Holden, of Iowa, has proved that by planting only sorted seeds, and four kernels to a hill, the average corn yield can be raised to fifty bushels to the acre, while extra culture will bring it up to one hundred bushels per acre. A new grain, which has been called corn wheat, has been developed in the Northwest, and will add millions of dollars to the farmers' wealth. Conceive the results of a new wheat that would average forty bushels to the acre. It would revolutionize the civilized world. Apples and native plums have been developed and selected with a widening of the great fruit belt by many miles to the north, and this work is being supplemented by such men as Professor Budd, of Iowa, and Gibbs, of Michigan, who ransack Europe and Asia for varieties able to endure more frigid conditions.

The field is open for woman as well as for man. There is no reason why the girls should not be interested in applied science as well as the boys. My bed of cross-bred phloxes is a marvel, and it is a work in the way of selection that any woman can undertake without adding seriously to her housework. I know one woman who has carried her experiments into the vegetable garden, with good re-

sults in the way of new varieties of tomatoes and potatoes. Even if no marked progress is made, the work is so interesting as to afford relaxation and recuperation, while it is inspired with intellectual stimulus. Such work on a farm constitutes a school of every day life. Boys and girls trained to apply their studies in the field get very deeply in love with the country. Working the soil becomes applied chemistry; planting corn and beans with judgment is applied botany, and entomology is nothing more nor less than fighting codling moths and potato bugs. Our homes become colleges and our fields are laboratories. Ancient knowledge is subordinated to modern. Bread-winning is not the only end of work; we are also working for the good of the world. All knowledge is at once applied, and the application unlocks stores of wisdom of a practically useful sort. Such study never unsettles the brain nor disturbs the nerves. The man with the hoe becomes the man with the microscope.

CLINTON, N. Y.

Credo

BY PROF. W. E. BURGHARDT DUBOIS

AUTHOR OF "THE SOULS OF BLACK FOLKS." ETC.

I BELIEVE in God who made of one blood all races that dwell on earth.

I believe that all men, black and brown and white, are brothers, varying, through Time and Opportunity, in form and gift and feature, but differing in no essential particular, and alike in soul and in the possibility of infinite development.

Especially do I believe in the Negro Race; in the beauty of its genius, the sweetness of its soul, and its strength in that meekness which shall yet inherit this turbulent earth.

I believe in pride of race and lineage and self; in pride of self so deep as to scorn injustice to other selves; in pride of lineage so great as to despise no man's father; in pride of race so chivalrous as neither to offer bastardy to the weak nor beg wedlock of the strong, knowing that men may be brothers in Christ, even tho they be not brothers-in-law.

I believe in Service—humble reverent service, from the blackening of boots to the whitening of souls; for Work is Heaven, Idleness Hell, and Wage is the "Well done!" of the Master who summoned all them that labor and are heavy laden, making no distinction between the black sweating cotton-hands of Georgia and the First Families of Virginia, since all distinction not based on deed is devilish and not divine.

I believe in the Devil and his angels, who wantonly work to narrow the opportunity of struggling human beings, especially if they be black; who spit in the faces of the fallen, strike them that cannot strike again, believe the worst and work to prove it, hating the image which their Maker stamped on a brother's soul.

I believe in the Prince of Peace. I believe that War is Murder. I believe that armies and navies are at bottom the tinsel and braggadocio of oppression and wrong; and I believe that the wicked conquest of weaker and darker nations by nations whiter and stronger but foreshadows the death of that strength.

I believe in Liberty for all men; the space to stretch their arms and their souls; the right to breathe and the right to vote, the freedom to choose their friends, enjoy the sunshine and ride on the railroads, uncursed by color; thinking, dreaming, working as they will in a kingdom of God and love.

I believe in the training of children black even as white; the leading out of little souls into the green pastures and beside the still waters, not for pelf or peace, but for Life lit by some large vision of beauty and goodness and truth; lest we forget, and the sons of the fathers, like Esau, for mere meat barter their birthright in a mighty nation.

Finally, I believe in Patience—patience with the weakness of the Weak and the strength of the Strong, the prejudice of the Ignorant and the ignorance of the Blind; patience with the tardy triumph of Joy and the mad chastening of Sorrow—patience with God.

ATLANTA UNIVERSITY, ATLANTA, GA.

A Clearing House of the Sciences

BY EDWIN E. SLOSSON

"There is not much boldness in predicting that the historian of the distant future, in tracing the growth and co-operation and the tendencies to a federation of human effort, which are one of the strongest transformative influences now affecting mankind, will record this congress in which we have met together as a significant point in this portentous stage of man's progress toward his own known destiny."—*Prof. J. B. Bury, of Cambridge University.*

"PEACE hath her victories" but less renowned than those of war. Consequently the audience which assembled in Festival Hall at the opening exercises of the International Congress of Arts and Sciences at St. Louis was very small compared with that which simultaneously witnessed Cronje and Viljoen fight over their South African campaigns not far away, and the thunders of their artillery frequently drowned the voices of the peaceful scholars and shook down the plastering on their somewhat insufficiently protected heads. But the echoes of war died away, more quickly doubtless than the echoes of the words of friendly greeting which were being exchanged by the representatives of the civilized nations of the earth.

It was an object lesson in world comity to see how the greatest men of different races were working together in the pursuit of truth. In this peaceful concourse sectional hatreds were forgotten, and upon the same platform could be seen scientists from Russia and Japan, France and Germany, Chicago and St. Louis.

The arts, however, are not so unprejudiced as the sciences, and the Garde Republicaine band introduced a discord into the harmony of the Congress by refusing to play "Die Wacht am Rhein" when Germany was in turn toasted at the banquet given to the members at the Tyrolean Alps.

First of our distinguished guests to greet us was Sir William Ramsay, of University College, London. However it may be on the Atlantic coast, the average American in the Mississippi valley has a certain feeling of resentment and contempt for a titled Englishman, alleviated by sympathy for those who are born such. But the genial way in which he took his right hand from his pocket and laid it palm upward upon the desk as tho to shake hands with all those whom he addressed, "not as foreigners, but relatives," disarmed at sight the most bumptious of patriots. Professor Ramsay, to use his honorary title, is associated in the popular mind with the argon group of gases, but he has nothing of the

THE SECTION OF COSMICAL PHYSICS

From left to right: Abbott L. Rotch, Blue Hill Observatory; Svante Arrhenius, Stockholm; Francis E. Nipher, Washington University; H. H. Clayton, Blue Hill Observatory; L. A. Bauer, Washington, D. C.

inertness characteristic of the elements he has introduced to the world. His tall, gaunt figure, careworn face and pleasant smile became one of the most familiar in the halls of the Congress.

M. Gaston Darboux, the Perpetual Secretary of the Paris Academy of Science, presented the greetings of France, but altho he stood under the Bourbon lily flag of the Exposition and in the city of the patron saint of his country, was not as well understood as the two German speakers who succeeded him, Prof. Wilhelm Waldeyer, of the University of Berlin, and Prof. Theodore Escherich, of the University of Vienna. The audience followed these addresses sufficiently at least to smile at the compliments and to laugh at the jokes.

Dr. Oscar Backlund, Director of the Pulkowa Observatory, was received with great applause as he presented in excellent English the compliments of Russia. Signor Attilio Brunialti, the Italian authority on constitutional law, also began in English, but shifted to a higher gear as he struck into his native tongue.

The veteran astronomer of America, Prof. Simon Newcomb, as President of the Congress, then returned these international compliments and thus announced the purpose of the assemblage:

"The problem before the organizers of this congress was to bring the sciences together, and seek for the unity which we believe underlies their infinite diversity. The assembling of such a body as now fills this hall was scarcely possible in any preceding generation, and is made possible now only through the agency of science itself. It differs from all preceding international meetings by the universality of its scope, which aims to include the whole of knowledge. It is also unique in that none but leaders have been sought out as members. It is unique in that so many lands have delegated their choicest intellects to carry on its work. They come from the country to which our republic is indebted for a third of its territory, including the ground on which we stand; from

the land which has taught us that the most scholarly devotion to the languages and learning of the cloistered past is compatible with leadership in the practical application of modern science to the arts of life; from the island whose language and literature have found a new field and a vigorous growth in this region; from the last seat of the holy Roman Empire; from the country which, boasting of the only monarch that ever made an astronomical observation at the Greenwich Observatory, has enthroned science in one of the highest places in its government; from the peninsula so learned that we have invited one of its scholars to come here and teach us our own language; from the land which gave birth to Leonardo, Galileo, Torricelli, Columbus, Volta—what an array of immortal names!—from the little republic of glorious history which, breeding men rugged as its eternal snow-peaks, has yet been the seat of scientific investigation since the day of the Bernoullis; from the land whose heroic dwellers did not hesitate to use the ocean itself to protect it against invaders, and which now makes us marvel at the amount of erudition compressed within its little area; from the nation of farthest East, which, half a century of unequaled progress in the arts of life, has made an important contribution to evolutionary science through demonstrating the falsity of the theory that the most ancient races are doomed to be left in the rear of the advancing age—in a word, from every great center of intellectual activity on the globe I see before me eminent representatives of that world-advance which we have come to celebrate."

The Congress was a success in bringing great thinkers together physically, but it is not so obvious that its other object—that is, of bringing them together mentally—was so successfully attained. As President Harper, who has a genius for handling figures eloquently, stated it, the organizers issued 130 invitations to distinguished foreign scholars, 117 accepted and 96 were there in person. This certainly gave the educated public an exceptional opportunity to see and hear the men whose work they are studying, but otherwise the Congress did not differ so much from former scientific meetings as

THE SECTION OF THE METHODOLOGY OF SCIENCE

Front row, from left to right: George M. Duncan, Yale (Logic); William A. Hammond, Cornell (Logic); Ludwig Boltzmann, Vienna (Mathematics); James McK. Cattell, Columbia (Psychology); Wilhelm Ostwald, Leipzig (Methodology of Science); James E. Creighton, Cornell (Methodology of Science); Harald Hoeffding, University of Copenhagen (Psychology); Josiah Royce, Harvard (Methodology of Science); Jacques Loeb, California (Biology); Svante Arrhenius, Stockholm (Chemical Physics).

Karl Budde, Marburg (Old Testament); Eduard Sievers, Leipzig (Germanic Languages); Adolf Harnack, Berlin (Christian History); Otto Pfleiderer, Berlin (Philosophy of Religion)

was to be expected from its elaborate and unique plan. Professor Münsterberg's hierarchy of all knowledge, so warmly advocated and so hotly criticised, seemed to become in practice no more than a more or less convenient scheme for chronological arrangement of the various meetings. Each man attended the sections in which he was specially and professionally concerned and cheerfully ignored all the others, as usual. There was very little straying. The philologian talked to philologians and the electrician to electricians. In each of the 128 sections one address was to be on the relation of that particular branch of science to other branches, but in most cases the speaker, after making a few condescendingly complimentary remarks about other divisions of human knowledge, plunged enthusiastically and deeply into the exposition of his own special contribution to pending problems.

Some of those to whom was assigned the subject of the unification of the sciences did discuss this topic, but it was evident that they thought that the desired "unity" was to be attained by imperialistic methods. Each science showed a willingness to unify knowledge by annexing all contiguous territory, but without any promises of future independence to the intellectual domains thus benevolently assimilated. According to Profesor Royce, whose duty it was to put the metaphysical capstone on the structure of the accumulated knowledge, the twentieth century is an age of unification. But, if so, it is obvious that the twentieth century is mostly still in the future.

The organizers of the Congress succeeded admirably in obtaining scientists, but they found few philosophers. For this, however, they cannot be blamed. The construction of the temple of wisdom evidently must go on under conditions which put a stop to that former attempt to scale the heavens, the Tower of Babel, and the work on different parts of the edifice be done, as hitherto, by men who do not understand each other's language. The authorities who arrange the

next Congress for the unification of the sciences should make the stipulation that the chemists must attend the lectures, on comparative religions, and the "criminal group" those on cosmical physics, and so forth. This might result in some beneficial cross-fertilization of the sciences.

The practical arrangements for the Congress were very poor. The halls used were scattered over the grounds, a mile and a half in extent, and located in inconvenient situations, hard to find even for the English speaking members. Groups of perplexed philosophers besieged with questions the Jefferson Guards, who manifested a contempt for learned men quite incongruous with the name they bore on their caps. Many of the halls were so noisy as to make it difficult to hear what was said. Machinery, sham battles, bands, cars and the tramp of feet were hard to talk against. Most annoying of all are the little locomotives and trains that run all about the grounds under your feet.

The failure to give publicity to the announcements of this Congress and the elaborate precautions taken to prevent the casually curious public from crowding out those interested, together with the difficulty of finding out when and where and on what topic a certain man would speak, made the attendance at many of the meetings unnecessarily small. But good wine needs no bush, or, in more modern phraseology, a good show needs no barker, and however carefully hidden was the loft or shed in which a well-known man was to speak, a sufficient number generally found it to overcrowd it. As sixteen sections met at the same time, and there was an attendance of 50 to 350 at each, probably an average of over 100, the total number of auditors was not small.

In a Congress the object of which was to counteract "the subdivision and multiplication of specialties in science" it might have been better to have had fewer meetings and so larger audiences. As it was, no one could hear more than one

BENNO ERDMANN
University of Bonn (Methodology of Science)

K. MITSUKURI
University of Tokyo (Oceanography)

sixteenth of the addresses; not enough to give him any comprehensive idea of the general currents of thought. There was no Ferris wheel by which one could get a bird's eye view of the Congress, as he could of the Exposition grounds. To determine the conflict or concordance of the ideas presented we must wait for the publication of the volumes containing the addresses, and let us hope that it will not be delayed for a year or two, as is apt to be the case. The chief value of the proceedings of the Congress, apart from the actual information contained, will be in the opportunity it will give for the comparative study of contemporary intellectual movements. It will be like a weather map of the country compiled from observations of widely separated individuals, showing centers of high and low pressure, and the movements of storm centers, and enabling us to prognosticate with some assurance the conditions of the future.

Some few such storm centers, or areas of greatest intellectual activity, can, however, be distinguished now even by the casual and fragmentary observations of an individual. For example, in physical science interest centers about the new electrical theories. Physicists have grasped the idea of the electron like a new key and are trying to open with it all the old locks. Professor Langevin, of the University of Paris, stated that rather than attempt to explain ether by matter it would be better to reverse the process and explain matter by ether. By electrons he explains not only magnetic, electrical and light phenomena, but also the more ordinary properties of matter, such as inertia. He considers Newton's laws of dynamics as special cases of the motions of the electrons, which make up all matter, revolving like solar systems inside the atom. Electricity itself is granular and composed of atoms. Professor Nichols, of Cornell, is tired of answering with a puzzled smile the question, "What is electricity?" and so proposes to drop

THE SPEAKERS ON GERMANIC LITERATURE

EMILE PICARD,
Paris Sorbonne (Algebra)

the word altogether, except when defined as the science which treats of electrical phenomena. Electrical energy is as clear and simple a conception as heat, and for its quantity factor no other word is needed than charge. We cannot now deny the possibility of the transmutation of the elements or even of the change of mass. "The law of the conservation of matter is far more likely to be violated than the law of the conservation of energy."

Professor Rutherford, the brilliant young physicist from Montreal, traced the decomposition of radium through seven different forms, whose life varies from 10,000 years to three minutes. Helium was only one of the products, perhaps the alpha particles expelled from the atom of radium. Uranium is probably the parent of radium. It is possible to determine the age of rocks by the amount of helium in them. In the case of one mineral the age as determined by this method is 10,000,000 years.

The electron theory has given a new interest to the study of the sun, and one of the immediate fruits of the Congress was the organization of an international association for united effort in the investigation of solar problems. Prof. Svante Arrhenius, of Stockholm, one of the few foreign scientists who spoke extemporaneously in English, explained much of the meteorology of the earth as due to the expulsion of the electrons from the sun. These may act as condensation nuclei for the drops of water in the clouds, which thus acquire a high negative electrical charge. The theory also accounts for the coincidence of the eleven year periods of maximum sun spots with auroras and barometric variations upon the earth. According to Dr. A. L. Rotch, the man who flies kites on Blue Hill, it will be possible by the study of solar physics to foretell the weather for years in advance.

In biology the greatest interest centered about the new theories of the mode

HERMANN OBERMEIER,
University of Kiel (Bacteriology)

of evolution, which lay more stress on sudden and climacteric changes than the slow accretion of imperceptible variations considered by Darwin the most important factor. Prof. Hugo de Vries, of the University of Amsterdam, presented in good English his mutation theory of development, and Prof. C. O. Whitman, of Chicago, followed, giving chiefly the results of his own work on the variation of pigeons. Prof. C. E. Davenport, now in charge of the largest plant in the world for experimental evolution, emphasized the statistical side of the study. Professor Coulter, of the University of Chicago, rejoiced in the triumph of experimental morphology, which has put the problem of the origin of species upon an experimental basis. The ability we now possess to vary, and to vary promptly and widely, means the creation of new species under certain conditions. Prof. Jacques Loeb is always looked to for sensational announcements, backed by equally sensational experiments, and in this case he did not disappoint the confidence the public thus have in him. He said that biologists were already sufficiently advanced in their science to be able to control by chemical means the sex of newly formed cells, to determine whether the newly generated body shall be male or female. His colleagues in biology have to watch Professor Loeb lest he should steal their science away from them and turn it over to the chemists and physicists.

THE DEPARTMENT OF POLITICAL AND ECONOMIC HISTORY

From left to right: Edward Capps, Chicago (History of Greece); Rufus B. Richardson, New York (Classical Art); Andrew F. West, Princeton (Classical Literature); J. B. Bury, Cambridge (Modern History); Paul Shorey, Chicago (Classical Literature); Horace White, New York (Money and Credit); J. H. Wright, Harvard (Classical Literature); F. G. Moore, Dartmouth (Classical Literature)

The problems of the family were discussed by many speakers. Prof. Felix Adler, of Columbia University, could find in history no ground for the belief that the monogamic family, measured by the test of survival, outranks the polygamous family. The family of the present day is passing through a state of transition. The researches of scientists acquaint us with types of domesticity of which we had no previous knowledge.

Professor Graham Taylor, of Chicago Theological Seminary, thought that the growing independence of women will benefit the institution of marriage, for in the past many women were forced to marry for a home. Prof. George H. Howard held that at the present time marriage depended more on the family than the family on marriage. The home is becoming merely a place in which to eat and sleep.

Imperialism and concomitant race problems occupied the attention of many sections. One of the most interesting contributions to the discussion was made in the section devoted to Modern Painting, by a Japanese, Okakura Kurozi, who calls himself a conservative. He wears the kimono instead of our costume, and believes in holding as far as possible to native ideals in art and social forms. But, in reply to the criticism that Japan had been too hasty in assuming the forms of other nations, he said:

"Remember that the wholesale adoption of western civilization was not entirely a matter of choice. The only way to escape being crushed by the car of Juggernaut of imperialism is to get into it. Japan, now engaged in a death struggle, is the sole guardian of the natural civilization of Asia."

Prof. W. A. Dunning, of Columbia University, showed that every nation at a certain stage of growth developed the same tendencies toward imperialism. "Whatever may be the theory held by the individual, it is evident," said Prof. Abbott D. Lowell, of Harvard, "that the race problem will hang heavily upon civilization of the twentieth century."

WILHELM OSTWALD, Leipzig University (Methodology of Science)

JAMES McK CATTELL, Columbia University (Psychology)

There is no Englishman for whose opinion Americans have a greater respect than the author of "The American Commonwealth," and it is, therefore, not surprising that James Bryce attracted a larger audience than any other speaker. The most significant passage of his address is perhaps the following:

"Forbid the public servant to canvass or to speak, or to write on any political subject. Teach him to regard himself as a servant of the nation, and not of the political party to

the nation. You are no doubt debarring him from one of his privileges as a citizen, but he has other privileges which the ordinary citizen does not possess, and his special powers carry with them special disabilities. The chief danger which seems to threaten political life in our times is the growing power of wealth and the tendency to abuse public authority and public office for the sake of private gain."

Chancellor E. Benjamin Andrews, of the University of Nebraska, however, found this same money power in one respect a beneficent influence:

"It is among the philanthropist's most gratifying notes that this incredibly strong force is at every crisis of strained relations between nations on the side of peace. As a preservative of peace the money power deserves rank alongside The Hague tribunal."

In the discussion of religions, theologically, practically and historically, there was a noticeable absence of the animosity and high temper which used to be thought inevitable on such occasions. Statements which a few years ago would have been followed by heresy trials were received with applause. Prof. Adolf Harnack, of the University of Berlin, usually succeeds in arousing *odium theologicum* wherever he goes, but his witty and eloquent address excited no manifest disapproval. Prof. Otto Pfleiderer rejoiced in the contributions which modern psychology were making toward the explanation of such religious phenomena as conversion and mystical states.

"The historical comparison of religions takes us from an absolute dogmatic positivism to a relative evolutionary manner of study, placing all religions, without exception, under the laws of time progression and under the causal connection of the law of time and effect. The value of the Christian religion can never suffer in the view of a reasonable man when it is not accepted in blind faith, but as a result of discriminating comparison."

NEW YORK CITY.

In the Golden Light

BY MAURICE FRANCIS EGAN

If you keep the flowers, I will keep the sun,
So that in the gloaming, when the night is near,
We can sit together, with our work all done,—
Tho the winds be moaning, we shall have no fear.

I will keep the sun, Love, in my soul for you,
You will have the flowers, and your happy voice
Shall change them all to music,—I shall hear the dew
On the lilies saying, "Again, O heart, rejoice."

Will you be the garden?—honeysuckle, rose
Of our happy youth time shall fragrant make your speech!—
Will you be the orchard? where bended trees inclose
Nests of birds a-singing o' the apple and the peach!

I shall have the diamond of fair memories
Filled with years of sunlight that can never die,
Till beyond the rainbow our clear eyes can see,—
We shall go together,—happy, you and I.

WASHINGTON, D. C.

Literature

Another Southern Novel

SOME years ago Will Harben introduced a new character in Southern fiction. And, after the long procession of hero-aristocrats, who have become the romantic "hard stock" of novelists in that section, Abner Daniel came as a sort of literary godsend. The type is native, and not extinct, as is largely the case with the more pretentious military heroes. And we are glad to welcome him again in Harben's new story.*

The scenes are laid in North Georgia and there is nothing startling or original

WILL N. HARBEN
Author of "The Georgians" (Harper's)

about the plot. But, for that matter, there is not much which is startling in the even tenor of real life, at least not as much as the blood curdling novelist often pretends,—and Harben is a gentle realist who wanders into a country neighborhood with the air of a man who had been born there, and writes out his story as it comes to pass in the hearts and lives of people about him. He gives the delightful impression of having detected his characters thinking apart from himself. And that is the charm of it. Their reflections are as near and kin to the situations as roses and cotton blooms are to Georgia soil.

This manner of telling his story interferes, of course, with its literary symmetry, so that it is no more like a framed and varnished work of art than a painting is like the life scene which suggested it. Thus, if Abner Daniel goes "to town," Harben hurriedly ends the chapter in which Eric Vaugh is boring the reader with his love affairs, and follows after to report what Abner thought by the way and said to his friends about the courthouse concerning the moral and political questions of the day. He even tips after him into the church, where it develops that Abner is a mild "free thinker," teaching a Sunday School class slyly under the very dripping of the sanctuary:

"After all, have you uns ever thought that the chief difference betwixt an orthodox man an' a free thinker is simply that the free thinker has imagination an' t'other don't know what sech a thing is? Now fer be it from me to underrate the sacred book o' books; but, boys, grand as it is, parts of it at least was writ by men who didn't have much imagination. I grant you St. John had enough when he was writin' about what he seed on that island when the very sky was full o' candlesticks an' suntin' bull yearlin's. He seed one red dragon wipe all the stars out o' the heavens an' pitch 'em in a pile on the earth; but right thar, ef I may be allowed to call the most imaginative writer among the ancients to law, I'm goin' to say that St. John's imagination wasn't up to the present scientific age. A man with imagination in this day an' time ud actually turn St. John inside out. Instead o' saying that the stars o' the universe could be lashed about like flies on a hoss's tail in August, he says the entire globe we reside on don't amount to a grain o' sand on the shores o' some big stars that really are in the business!"

But it is impossible to give an idea of Abner's character with isolated quotations. He is not only a higher critic, a political economist and a social mascot; he is a philosopher of human nature. This requires a sense of humor. The wise man who deals merely with dogmas and abstract theories can afford to lack it, but he cannot interpret the heart and life of a man without a squinting wit. There is something so amusingly mis-

* THE GEORGIANS. By Will N. Harben. New York: Harper Bros. $1.50.

shapen about existence after it has been rent and twisted by the aspirations and frailties of a human being, and Abner Daniel knows exactly how to poke a long finger kindly at the crooked places, with a comment that is illuminating and amusing, because he so perfectly fits the deformity with his droll use of terms.

It is sometimes remarked in the North and East that the South is lacking in the sense of humor, and this may be true, taking that section as a whole. But Georgia is an exception. The temperament of the native Georgian, whether he is found in the pulpit, on the hustings (and the difference there between these two oratorical latitudes is less than elsewhere), or in the literary world, is so sensitized that it flowers into humor and pathos as naturally as the soil produces cotton and cockle burrs. During the present generation the upper and middle portions of the State alone have given us writers who, besides other gifts, are preeminently known as humorists. They are A. P. Longstreet, W. T. Thompson, J. J. Hooper, Francis O. Ticknor, Richard Malcolm Johnston, Harry Sillwell Edwards, Frank Stanton, Joel Chandler Harris and Will Harben.

Municipal Ownership as Developed in England

THERE is no preface to Major Darwin's study of the Advantages and Disadvantages of Municipal Trade.* It is certainly a lack; and the lack is felt by the reader. He is soon conscious of it; because here and there Major Darwin makes suggestions and explanations which would have been better stated in a preface; and, moreover, the reader must proceed as far as page 436, in a volume of 464 pages, before he has a clear statement of where the author stands on the question—not as it presents itself in the United States, but as it has been variously and peculiarly developed in England and Scotland. Up to this point—that is, up to page 436—the reader, in spite of all the delicate balancing of the arguments for and against municipal trade, has had a feeling that Major Darwin has but little sympathy with many phases of municipal development in England. The English municipalities have invested £24,000,000 on gas undertakings. Major Darwin would prefer to see these, as well as electric lighting and power plants and street car systems, in the hands of limited liability companies—corporations, as they are called in this country—and were it possible he would call a halt in respect to all these municipal undertakings, and have Parliament so legislate that no municipality should henceforth embark in them.

Major Darwin can point to no specific scandal nor to any specific waste which has resulted from these municipal enterprises in England. But he has gleaned much concerning municipal maladministration and corruption in the United States; and while he concedes that the evils here are large due to the unprecedentedly quick growth of the great cities, he is apprehensive lest an extension of municipal enterprises in England will bring down the standard of municipal life there. He admits that there is some jobbery in English municipalities; but he claims, and with good reason, that no country in the world can compare with England as regards the wide powers conferred on the municipal councils, combined with the character of the representatives serving on them. Bryce and Lecky among British authorities on political science, as well as many more recent writers—most of whom are Americans—are cited as to the deplorable conditions in New York, Philadelphia, Chicago and St. Louis. Then, after quoting the authorities, Major Darwin urges that no Englishmen can read such statements "without feeling the strongest desire to keep our existing purity, such as it is, free from the terrible evils of corruption and the spoils system." "It must be acknowledged," he adds, "that any step which increases the danger of the introduction of this disease should only be taken if the advantages from it are conclusively proved to be of great importance." Major Darwin is at his best, and on firm ground, when he shows that municipal ownership has a tendency to retard development; and again, when he argues against munici-

* MUNICIPAL TRADE. *The Advantages and Disadvantages Resulting from the Substitution of Representative Bodies for Private Proprietors in the Management of Industrial Undertakings. By Major Leonard Darwin.* New York: E. P. Dutton & Co. $3.50.

palities going beyond the field of monopoly and entering into competition with private capital in such undertakings as the manufacturing of electrical apparatus and in the building of houses for the working classes. These, as he shows, are the weak spots so far in English municipal enterprise. He gives us a detailed and comprehensive study of the question as it is presenting itself in England, where municipal enterprise has entered on some fields which are unthought of in this country when municipal ownership is discussed; and when once Major Darwin's standpoint is realized, any student of the question will concede that he has written a work the usefulness of which is not confined to England.

Reprints

*Handy Andy** is perhaps a work of no great literary merit; it may not deserve a very high or a very permanent place in the memory of man—and we are assured nowadays that it is not even true to the character of the race which it pretends to depict, that not these rollicking country squires and this left-handed peasantry, but Mr. Yeats's gentle visionaries are the real Irish. And yet, in spite of these serious disadvantages, it is still a fairly entertaining story, as compared with the present novel of commerce, and has an additional spring of interest, after all, as the kind of thing that used to amuse our ignorant parents.

Pierce Egan's *Life in London*† is one of those nondescript performances which are fortunately rather out of fashion today. Its main interest is to be found in the pictures by the Cruickshanks, for which the letter-press is only a make-weight. Some day, perhaps, the text may serve as an historical document for the restoration of early nineteenth century manners and morals. Indeed, the ingenious Mr. Egan's dedication to his glorious sovereign, George the Fourth, is a singular study in vulgar obsequiousness and blatant self-sufficiency for any age. But in the meanwhile, as the original illustrations are so hard to come by, it is something of a service to have put these really curious caricatures within reach of the modest purse, and this remark is true also of the same ingenious gentleman's *Life of an Actor*,‡ tho Lane's illustrations, with which the latter is embellished, are not perhaps so desirable, at least so much sought after, as Cruickshanks'.

The National Sports of Great Britain§ is another work of the same general character—only that the text is still more insignificant. The volume consists of a number of brilliantly colored plates illustrative of the subject, each accompanied by a brief explanation in letter-press.

The Tour of Dr. Syntax in Search of a Wife‖ finally closes that learned gentleman's "weird and truculent existence." The verses are amusing, undoubtedly, tho they have as certainly lost something in the course of several generations—our humor is not quite so broad or so good natured as was our grandfathers'—and it may be questioned whether much of the fun for us does not reside in the quaintness of Rowlandson's excellent pictures.

In spite of Dr. Johnson's small opinion of Blair's *Grave*,** it is still possible to read this poem, if not with pleasure, at least with curiosity. But we imagine that this particular reissue of Cromek's edition of 1808 will prove most interesting for its twelve very characteristic drawings by Blake.

All these volumes are in Appleton's new series of reprints and are done in their usual admirable style—particularly the reproduction of the prints—tho we have noticed in *Handy Andy*, for instance, a number of typographical errors.

Nor should we neglect to notice in this connection Macmillan's new edition of *Evelina*,†† with an introduction by Austin Dobson and numerous illustrations by Hugh Thompson. This is the book, it will be remembered, which

Burke sat up all night to finish, from which Johnson caught several by-words, and over which Dr. Burney himself actually "blubbered." It is not so easy to smite the rock nowadays, the source of tears is very much drier; but we must confess that we ourselves have often sat over the story when we should have been abed or about our business. There is a familiar charm about it yet, not unlike that which invests the quiet life and romantic marriage of its ingenuous author.

A Cornish Poet

In his way the Rev. R. S. Hawker, Vicar of Morwenstow,* must have been something of a character, a "humor" of the right Jonsonian sort. Like most poets he appears to have carried on a desperate feud with oblivious editors and public; but he finally succeeded in baffling their shameless conspiracies against his fame by an expedient which is fortunately in very little danger of imitation by our more modern literary aspirants. He writes in a letter to a friend:

"I have at last discovered a mode of publicity and circulation whereby I baffle the resolve of these editors that nobody shall read my lines. It is a costly but effectual plan. I print my verses at my own expense in London, get down some hundreds on fly leaves . . . . and then insert a copy or two ingeniously in letters of business when I pay an account, . . . and thus my lines in a moment of surprise or curiosity *are* read and *do* become known."

As for Mr. Hawker's verse, which is a good deal better than this doubtful recommendation would seem to imply, it is composed mainly out of bits of the life, legends and scenery of Cornwall gathered up during the course of a long life in his quiet country vicarage.

"Wild things are here of sea and land,
Stern surges and a haughty strand."

Some of them are very interesting, even fascinating; others not so much so. But in general he is at his easiest, if not perhaps his rarest and best—for his talent is of the single sort—when he comes nearest to the simplicity of his villagers and the homeliness of their native feeling, as in *Datur Hora Quieti,* verses on the funeral of one who should be buried at five o'clock, "because it was the time at which he used to leave work." By no means infrequently he catches other of the ballad moods—its swagger and recklessness in the "Song of the Western Men" so successfully as to have deceived Scott and Macaulay; even the sorcery and supernaturalism which Coleridge imitated so startlingly in the "Ancient Mariner." Indeed, there is a sort of parallelism between the varieties of artificial ballad which these two practitioners struck out, and Hawker's rather fine "Pauline" makes in a manner no insignificant pendant to Coleridge's "Love." Now and again, of course, he rises considerably above the general level of his own work. Such an ascension is the "Quest of the Sangreal," which, tho a fragment, is the best poem in the whole book—a new reading of the old romance, without that curious air of insubstantiality, that faint scent of mold and dissolution which characterizes Tennyson's versions of the later incidents of the Arthurian legend. All Hawker's verse is penetrated with strong religious, or, one may say, ecclesiastical, emotion, verging toward a sort of churchly mysticism, which is sufficiently accounted for, no doubt, by his leanings to Roman Catholicism. The volume is intended as a popular edition of Hawker's poetry, the first collection of which dates from 1869, and will be supplemented by a volume of his prose and another of biography and correspondence.

* Cornish Ballads, and Other Poems. *By R. S. Hawker.* New York: John Lane. $1.50.

A Frenchman's View of the English.

The defects of the merits of the French habit of generalization and deduction from preconceived ideas and principles could hardly be more aptly illustrated than in M. Boutmy's study* of the political psychology of the English people. Such a method of procedure insures a broad view and enables the reader to grasp at once the general lines of the picture, but to be correct the first req-

* The English People. *A Study of Their Political Psychology. By Emile Boutmy. Translated from the French by E. English. With an Introduction by J. E. C. Bodley.* New York: G. P. Putnam's Sons. $2.50.

uisite is that the premises shall be absolutely accurate—that there be no error in the generalizations from which the deductions are drawn. But M. Boutmy's book is full of errors—some due to preconceptions, of which no study of the English people has sufficed to free him, and others probably to his own infirmity of almost complete blindness. To his partial sight must surely be attributed his constant emphasis on the fogs and lack of color or outline in English scenery, and to the supposed consequent inability of the English people to form clear perceptions. Surely no one with good eyesight could ever have written: "The Englishman mostly sees nature through fog or mist; objects disappear under this veil, or rather their outlines seem confused and blurred; their coloring becomes dull; the delicate tints have not sufficient vibration and brilliancy to burst through the cloud and appeal to the eyes. The violent colors only—red and green, for instance—can triumph over the thickness of the veils." And on this generalization—which might presuppose an acquaintance only with London or Manchester in the depths of a November fog—is founded a whole theory of English slowness of perception and lack of discrimination.

Altho M. Boutmy writes from the French point of view, and with a preconceived idea of the great inferiority of the Anglo-Saxon in all that concerns perception and sympathy, no English writer has ever paid such a full and ungrudging tribute to the qualities on which the English nation specially prides itself. It is to be presumed that M. Boutmy has not yet pushed his investigations as far as the United States or he would have reserved some of his superlatives for the younger and still more energetic nation. As it is, in many places one would think that it is America rather than England of which M. Boutmy writes, when he speaks of the optimism of the people, their readiness to take risks, their restless energy, their absorption in their business and the difficulty of distracting their attention from the work in hand.

"Long Ale Four Years Longer." From "The Nineteenth Century in Caricature." Dodd, Mead & Co.

In the recent history of England which M. Boutmy gives there are many serious errors. He speaks of the rural population of England as shifting, and accounts for the allotment and small holdings legislation as the attempt of shrewd landowners to attach the peasants to the soil. More glaring is the error on p. 264, where he speaks of the Church as having been separated from the State, and on 312, where he speaks of Gladstone as the author of the Reform bill of 1867. In spite of these and other similar errors, the book cannot fail to be interesting to English and American readers. It presents a distorted picture of the Anglo-Saxon races; but the distortions chiefly consist in an exaggeration of the features on which both English and Americans most pride themselves, and a belittlement of qualities which they regard as unimportant.

The History of the Nineteenth Century in Caricature. By Arthur B. Maurice and Frederic Cooper. New York: Dodd, Mead & Co. $2.50.

The history of the last century as presented in these pictures bears about the same relation to the actual events as those entertaining images reflected by concave and convex mirrors do to the people who stand before them. Monstrosities have in all ages been of interest to mere normal human beings, and the irreverent handling of dignitaries has a

savor of daring that attracts. But, apart from this, such political caricatures have a historic value as the permanent record of an idea, or, more likely, a feeling, which is too transient and often too gross to be expressed in cold type. This volume has more cartoons than it has pages, including examples of the famous caricaturists of France, England and Germany. A large proportion of space is devoted to American sketches, which are not inferior in wit or artistic merit to the best foreign.

St. John. By Robert F. Horton. New York: E. P. Dutton & Co. 50 cents.

It would be difficult for any one who picks up this thin, pamphlet-like volume and glances at the self-contained and dignified English of the Preface to confound it with the efforts of the usual amateur poet. The writer, indeed, defines his position pretty exactly when he says "that as a poet may sometimes write prose without claiming to be prosaic, so one whose familiar vehicle is prose may sometimes write verse without claiming to be poetic." He is not a poet precisely; his verse is evidently an avocation. But he has some poetic or perhaps general literary qualities which make his poem worth reading. Something it owes to a "Death in the Desert." It is a monologue "supposed of" St. John the Evangelist, discoursing of his Gospel to the amanuensis who sets it down.

"Bring me the parchment, son, and sit beside me,
And write for me the things I saw and heard;
The hasting years and gathering shadows chide me,
Because I have not written of the Word."

At its best the verse is quite simple and unforced, like this, and yet there is often an elevation, even a thrill, about it, which does not by any means always mark a more pretentious effort.

Ballads of Valor and Victory. By Clinton Scollard and Wallace Rice. New York: Fleming H. Revell Co. $1.50.

The volume is a good instance of the kind of attempt popular nowadays to manufacture literature out of the events of American history. It contains fifty of these machine-made ballads "from the annals of America," twenty-five to the credit of each collaborator; and very curious it is to see the various literary conventions and manners which protrude through the thin disguise of a popular and autochthonous treatment. There are echoes of Kipling, Tennyson, even Swinburne and whom not that has ever attempted a like *tour de force*. Sometimes, however, the stuff stirs when the handling does not, and occasionally the poetry itself, particularly when it forgets for a moment its peculiar pretensions. So Mr. Scollard's *L'Envoi, "Ad Patriam:"*

"To deities of gauds and gold,
Land of our Fathers, do not bow!
But unto those beloved of old
Bend thou the brow!

Austere they were of front and form;
Rigid as iron in their aim;
Yet in them pulsed a blood as warm
And pure as flame;—

Honor, whose foster-child is Truth;
Unselfishness in place and plan;
Justice, with melting heart of ruth;
And Faith in man.

Give these our worship; then no fears
Of future foes need fright thy soul;
Triumphant thou shalt mount the years
Toward thy high goal!"

But the most significant thing about the book, after all, is its lesson: evidently this is not the way in which literature is to be made.

India and Christian Opportunity. By Harlan P. Beach, M.A., F.R.G.S. New York: Student Volunteer Movement for Foreign Missions, 1904. 50 cents.

This volume is the twenty-seventh in a series of text-books prepared primarily for the use of voluntary mission study classes in the institutions of higher learning of the United States and Canada. It will prove a valuable book, not only to those for whom it is especially intended, but to all missionary societies, and to all who are interested in the great work of evangelizing the world. It is written in a most interesting style and is enriched by many good illustrations. It contains also maps, statistical tables, a brief bibliography and a good index.

The Fire Bringer. By William Vaughn Moody. Boston: Houghton, Mifflin & Co. $1.10.

In many respects Mr. Moody's *Fire Bringer* is an admirable piece of work and contains a good deal of blank verse of a very high order of merit. It is intended as the first of a Promethean triology and begins immediately after Deukalion's deluge, when Prometheus in defiance of Zeus restores fire, as the principle of life and animation, to the earth. The waves have subsided, but it is still a diluvian world of ooze and slime haunted by a few survivors of the catastrophe, men and beasts, and in the midst Deukalion and Pyerha and the spiritless men and women they have made of stones and clods—a world of cloud and darkness and terror, in which man's mind is staggered and reels. Such a theme naturally invites comparison with Shelley's "Prometheus," on the one hand, and Æschylus' on the other. Of the latter the prevailing mood is horror, —a dread of moral confusion and disorder, a desire to set the facts of experience right for the human conscience. Of the former the prevailing mood is hope, an aspiration of liberty. In a sense Mr. Moody combines these two moods; he both hopes and fears. But his fear is not moral, but physical—the dread, not of a mind distracted, but of a world materially deranged; while his hope is in the reign of law, the prognosticable movements of a clock-work. Of confusion of any kind, moral or physical, Shelley has obviously no cares; his liberty involves the triumph of both. To the idea of a physical system, as we understand it now, Æschylus has apparently never reached, while Mr. Moody would seem to expect the solution of all spiritual difficulties, as it were, through the material operations of a regular social order.

Moses Brown, Captain, U. S. N. By Edgar Stanton Maclay. New York: The Baker & Taylor Co.

If absence of navy sentiment, apparent ignorance of its traditions and a provoking dullness of style fit a writer to be what his publishers call the "leading naval historian of the country," Mr. Maclay has pre-eminent qualifications. His present work is a needlessly extended biography of Captain Moses Brown, who commanded a privateer during the Revolution, fought two actions, came into the Navy in 1798, commanded the "Merrimac" during the quasi-war with France, did nothing in particular and after two years' naval service was mustered out. All this might justify a brief magazine sketch, but furnishes no sufficient reason for a book. It is to be regretted that Mr. Maclay should make it the means of reviewing and misstating a matter which the navy and every one interested therein earnestly desires forgotten. In a series of platitudes on "opportunity" he remarks that

> "Commander Miller's fiery expostulations against Sampson's order depriving him of the command of the collier 'Merrimac' at a moment when opportunity was within reach bordered seriously on one of the gravest of military offenses."

This renders it necessary to say that the replacing of Commander Miller by Assistant Naval Constructor Hobson is now recognized in the navy as a wholly arbitrary proceeding, explicable only by Admiral Sampson's impaired mental condition at the time. The sole opportunity lost by Commander Miller consisted in not refusing to give up his ship. A mistaken, tho none the less high, sense of patriotism and self-abnegation obscured temporarily his perception of this plain duty, to his subsequent great regret. Mr. Maclay's perversion of the matter indicates that the somewhat severe lesson administered to him by the ejection of his "History of the Navy" from the Naval Academy has been little heeded.

Siege Days. By Mrs. Ada Haven Mateer. New York: The Fleming H. Revell Co. $1.25.

Stories of the "Boxer" troubles have somewhat lost their bloom, but the charm of this volume is the perpetual charm which exhales from personal correspondence. *Siege Days* is a compilation of private letters and journals of persons from widely diverging points in the missionary field in China—all of whom were later brought into the close companionship of the exciting and fear-stricken days of the Pekin siege. In

On the Broads. Near Acle. From "Among English Inns." L. C. Page & Co., Boston

countries like China, where disturbances such as the "Boxer" outbreak, which, as regards its manifestation in hatred of the foreigner, is obviously not quashed, but in the belief of all foreign residents in China is certain to break out again, such books as Mrs. Mateer's are not only of thrilling present interest, but possess also a value that—like good wine—increases with time. Mrs. Mateer reaches the conclusion, as do many of the missionaries, that had the foreign officials been more fully alive to the danger—danger which, oddly enough, is always pointed out to foreigners in China months before it finally occurs—the Boxer disturbances would never have attained their unfortunate proportions. There is nothing budding, dreamed of or thought of kept secret in China. Every coolie, every servant may be a messenger to carry the news. Even a foreigner's guests at dinner in the seclusion of his own fireside are known next morning at the Yamen, if it is the wish of the Chinese authorities that this should be known. If, however, before the siege foreign officials were prone to be apathetic and skeptical, the kindness and heroism of the Legation members went far to make amends, and stand out with brilliant and noble conspicuousness, and, as the author intimates, have strengthened the bond between the missionary and other foreigners in China—a bond which, owing to wide diversity of interests, is perhaps apt to hang in loose strands.

Jess & Co. By J. J. Bell. New York and London: Harper Bros. $1.50.

Mr. Bell's stories lack the pathos of McLaren's, for instance, but he is happily able to interpret the flinty humor of the Scotch mind, the moral harshness of Scotch character, and the quaint tenderness that glows in the rugged heart of it like a warm hearth fire. *Jess & Co.* is a witty tale of homely human nature as illustrated in the village of Kinlochan. Jess, the young wife, is like a bright spark, forever flying upward in her aspirations. And she succeeds as well with her husband as he does with his roses. But if the story is true to life, the Scotch husband shows more of the publican-and-sinner's humility than any other domesticated fowl of his kind ever showed. Certainly, he is the one husband in current fiction or contemporary life who is ready to admit that his wife is right in every contention, even if the concession proves him to be foolish and incompetent.

Among English Inns. By Josephine Tozier. Boston: L. C. Page & Co. $1.60.

The sub-title of this charmingly illustrated book, "The Story of a Pilgrimage to Characteristic Spots of Rural England," sufficiently indicates its scope. It is a pleasant, uneventful journey through the peaceful villages of England—to Gilbert White's Selborne, to Chawton, where gentle Jane Austen lived; to Alton, the chosen home of Mrs. Gaskell; Arlesford, where the Canterbury Pilgrims halted; past Exmoor, which recalls "Lorna Doone"; to Clovelly, the home of Amyas Leigh; through lovely English lanes, that we have seen in dreams, so green, so flower-fringed and tree-shadowed, that drives are an unending delight. The matron, the invalid, bright young Polly, the Treasurer of the party, and the author make up the quartet of friends, whose happy destiny leads them

through a landscape unmatched for quiet beauty and charm—unless it be by whatever country village the reader remembers as the home of his childhood. The gardens full of flowers and the flower-like faces of the rosy children make the doorways sweet at Clovelly, full of memories of Charles Kingsley, the reach of the sea and the added picturesqueness of streets like stairways, and the red sails of Devon boats glowing against the sky. Who does not envy them, this "Sentimental Journey"—a leisurely ramble through haunts dear to many an English poet or romancer, yet so delightful that the travelers sigh for "a whole summer" in each one of the pretty villages they pass? The numerous photographs are full of pervasive charm. We, too, long to dwell for a summer under the quaint roofs of the English inns.

A Kittiwake of the Great Kills. By Charles Frederick Stansbury. New York: The Grafton Press. $1.25.

Several of these stories appeared in THE INDEPENDENT, and they are now issued in book form with others which have appeared elsewhere. Mr. Charles Frederick Stansbury is known as a weaver of many stories of different climes, and this collection of animal tales stands in a class by itself, and gives him distinct rank as a writer of style and marked personality. They are unique in that they have the charm of fairy tales and an undeniable air of truth. This in itself may seem paradoxical, but it stands to reason when it is remembered that the charm of the fairy tale is the delicate touch and the intimacy that seems to be understood so well between the fairy weaver and his readers. This is the kind of book that will be passed from friend to friend, and gain new friends at each reading. The charm of comradeship is predominant—it is as tho you were beside the author watching and caring for his little pets; and so sympathetic is the pen that their joys and sorrows touch you just as insistently as they did the creator of the stories. Over and above all, they are surcharged with feeling and information, and the telling is neither pedantic nor dull—and that is the art of the true story teller. There have been so many pseudo-animal stories appearing in the current magazines—stories with no truth, form or beauty,—that it might be imagined the public would cry for a change; on the contrary, it seems impossible to surfeit the mass, whatever its demands may be. When a real book of animal stories appears—stories not filled with ignorance and error, but stories like "Aphrodite," "Petey" and "Madame Cestudo"—the writer is bound to receive the honor due him within a reasonable period.

God's Good Man: A Simple Love Story. By Marie Corelli. New York: Dodd, Mead & Co. $1.50.

The novels of Marie Corelli have been more read than reviewed, in which respect they differ from most of the novels published. She now seems to be relaxing her hostile attitude toward the press, and has sent out this, her latest book, for review, but prefaced by such stringent instructions to the critics that we dare not do more than quote:

"The Author's Note.

"For all sins, whether of omission or non-omission, of construction or non-construction, of conformity or non-conformity, of crudity or complexity, of diffuseness or dullness, of expression or of method, of inception or conception, of sequence or sequel, of singularity or individuality,—likewise for all errors whether technical and pertaining to the printer, or literary and pertaining to the author, and for everything imaginable or unimaginable that may be found commendable or uncommendable, pleasing or displeasing, aggravating or satisfying in this humble love story, for which no man will be the wiser and no woman the worse,

"GENTLE REVIEWER, BE MERCIFUL UNTO ME!

"And,

"From wilful misquotations,—from sentences garbled and random'y set forth to the public without context, continuation or conclusion, in attempt to do injury to both the story and its writer,—from the novel-skimmer's epitome, abridgment, synopsis or running commentary,—and from the objective analysis of Literary Clique 'stylists,' and other distinguished persons, who, by reason of their superior intellectuality to all the rest of the world, are always able, and more than ready, to condemn a book without reading it,

"MAY MY HUMBLE PRESS DELIVER ME!"

A Forest Drama. By Louis Pendleton. Philadelphia: Henry T. Coates & Co. $1.00

A romance of the Canadian woods which rarely rises above the commonplace and yet, somehow, perversely, does give the feeling of winding water-ways, forest-fringed lakes and camps fragrant with the breath of balsam and fir. The story is melodrama and the characters not convincing, even when they fight. We would suggest to the heroine Alberta, the "White Lady," that it isn't nice, whatever her wrongs may have been, to sneer at a fallen enemy. An English girl bred among Anglo-Saxon convictions ought not to "hit a man when he is down."

Literary Notes

Fox, Duffield & Co. are bringing out for the holidays a volume entitled "Rhymes of Real Children," by Betty Sage. The illustrations, by Jessie Wilcox Smith, are exceedingly effective, besides being full of the spirit of real children.

....Mr. Otto Zahn, of Memphis, Tenn., has in preparation a little booklet, descriptive of fine book binding, as executed by the old masters as well as by his firm. Mr. Zahn is especially well equipped to write on such a theme, as he is one of the most artistic of the present day book binders.

....China collectors will be interested in the forthcoming volume by Edwin A. Barber, the Curator and Secretary of the Pennsylvania Museum, which is entitled "The Marks of American Potters." Mr. Barber's monograph is the first attempt to furnish a complete list of marks used by American potters. The book is copiously illustrated.

....To illustrate a cook book by photographs of the cooks is something of a novelty, but "The Blue Grass Cook Book" certainly gains in attractiveness from the numerous smiling faces of turbaned mistresses of the Kentucky kitchen, who have developed a distinctive school of culinary art. The introduction, by John Fox, Jr., gives a literary flavor to the book, which makes it interesting even to those who do not intend to practice the art as given in these recipes (Fox, Duffield & Co., New York, $1.50).

....The American tourist rarely ventures to traverse the wilds of Europe without a red-covered Baedeker in his hands, but he has not learned to appreciate the value of securing the services of the same guide to his own country. But really such a condensed cyclopedia of reference is as much needed at home as abroad, and there is hardly any one who would not find it profitable to read the description of the city he knows best. The new edition of Baedeker's United States and Mexico has a special guide to the St. Louis Exposition (New York: Chas. Scribner's Sons, $3.60). "Italy from the Alps to Naples" is now given in a single volume of Baedeker at $2.40; a great improvement in convenience for the ordinary tourist over the three-volume editions.

Pebbles

Two old ladies riding uptown on an elevated train the other evening were evidently discussing domestic affairs. "When I first met my husband," one of them said, "it was at a masquerade ball. He was dressed in the garbage of a monk. I went up to him and said: 'Exit homo!'" Then a young woman in a rear seat tittered and no more gems were brought forth.—*New York Sun.*

Politics in New York

ONE-TENTH of the votes cast at the coming national election will be found in the ballot boxes of the State of New York. They will control nearly one-twelfth of the votes of the Electoral College. Mr. McKinley's plurality in New York eight years ago was 268,000; in 1900 it was 143,000. This year in the private gossip of politics the State is placed in the "doubtful" list. Indeed, one is accustomed to hear it said even by Republicans that the Democrats may be successful in New York this time. But it is added that the Republicans can elect Mr. Roosevelt without the help of New York. Which is true.

But why do so many feel that the great Republican pluralities of 1896 and 1900 may be followed in November next by a small but sufficient plurality on the other side? In some measure the return of a majority of the Gold Democrats to their party accounts for this opinion, which, of course, is not expressed in the columns of strictly partisan journals. This is not the only reason, however, nor is it the chief one. It is mainly because of the recent course of the leaders of the Republican party in New York that this uncertainty is found in the minds of many who desire that the electoral vote of New York shall be cast for Roosevelt and Fairbanks.

Rarely has the history of any State shown a greater political blunder than the acceptance of the chairmanship of his party's campaign committee by Governor Odell and his strict attention to the duties of his partisan office during the last few months. We cannot commend the declaration of the recent Democratic convention that "for the first time the Empire State has a Governor whose personal integrity rests under widespread suspicion." We know of no warrant for such an assertion. Nor does it seem to us that the merits of the current controversy between the Governor and the Attorney-General of the State (a Democrat) are such as to excite indignation in the minds of intelligent and fair-minded voters. Proof is not produced that Mr. Odell has promoted corruption and profited by it. Good men may honestly and reasonably differ as to certain policies of his administration, altho these have seemed to us to indicate a purpose to concentrate power for political and partisan use.

But a man who is unable to see the impropriety of acting in the double capacity of Governor of a great State—an executive officer who should be impartial, devoted to the interests of all the people, without regard to political divisions—and of the head of a purely partisan "machine" in an important campaign, is unfit not only to hold the office of Governor, but also to be intrusted with the management of his party's affairs. His failure to understand why it was improper for him to hold the partisan office without resigning the other one to which he was elected inevitably excites suspicion as to the motives that suggested and controlled his official course with respect to all the important acts of his administration at Albany. It gives weight to the charges of his political opponents concerning his personal and selfish interest in those acts. A Governor, it may be said, who consents to perform the duties of a campaign chairman in New York—duties that require him to be absent from his official place almost continually for months, duties that involve the soliciting of money and favor from rich and powerful corporations subject to State legislation and taxation, the conciliation of companies that may be affected by executive action, and the expenditure of a large fund for partisan purposes throughout the State—a Governor who does this, men will say, will not be restrained by any sense of propriety from doing other and very objectionable things in the exercise of his executive power and of his influence upon legislation. And so there arises naturally a

demand for a change of control at the capital that will permit the books to be examined.

In studying this remarkable political blunder and the possible effect of it upon the coming election we should not overlook the fact that nearly all of the Republican leaders in New York share responsibility for it. At a Sunday conference, on March 20th, Governor Odell was asked by Senator Platt, Senator Depew, Postmaster Van Cott, Collector Stranahan, Assistant Treasurer Fish, Surveyor Clarkson and others to take the chairmanship; and no one of them suggested that he should resign the office to which he had been elected. There was published last week an interview with Lieutenant-Governor Higgins (recently nominated for Governor) in which he said:

> "If I was Governor of New York, and my party asked me to act as chairman of its State Committee, I would resign my office at the time I accepted the position of chairman. It is a question of tact and propriety."

But Mr. Higgins was at that conference in March, and at the close of it he said to the press that "the duties of the two positions need not conflict" and that he saw "no reason why the Governor should not hold both."

The Republican party, so far as it is represented by the Senators, the Collector, the Postmaster, and the other officers we have mentioned, is responsible for this almost incredible folly in a State where the good will of intelligent independent voters is of much value at the polls. For this reason the example lacks nothing to make it symmetrical and complete, the worst of its kind.

We do not predict that the Republicans will lose New York. At present it seems reasonable to expect that Mr. Roosevelt will have the State's electoral vote. At the same time the Republican State ticket may be defeated, for the Democrats are united in support of a strong candidate, and there was a difference of 32,000 between the plurality for Governor and the plurality for President four years ago. If the popularity of the President in his own State should not save Mr. Higgins, or if both should fail in New York, the result will be due largely, if not mainly, to the cause we have been considering. This ought to be understood in other States where both parties are accustomed to regard the situation in New York with much interest and some anxiety. To those in distant places who have heard that Governor Odell is an expert practical politician, and who cannot see how he can be willing to endanger by his action the success of the Republican national ticket in his State, we may mention the explanation offered by certain political cynics, that he seeks a Senatorship and forgets everything else while planning to control the legislature by methods heretofore used effectively. To us, however, such an explanation seems inadequate.

The Two Parties on the Philippines

In the two platforms, and in the letters of acceptance, the two parties make much of their attitude on the Philippines. And yet they are not so much apart as it might seem. Both accept the war with Spain, and both accept the acquisition of the Islands. Both approve the policy of our Government in its attempt to educate the people for self-government. They differ only in one point, which is not fundamental, but only is made to seem so, the question whether our Government shall make to the people of those Islands the promise that at some future time, when they are ready for it, we shall give them absolute independence. It is not a question of self-government, but a question of independence, and that independence irrevocably promised. It is not a question of the time of independence, but only of some indefinite time, hopefully near. The Democrats do not ask to have independence given now, not by any means, for they recognize that it would not be safe; but they demand that we promise the people that at some time in the future, when we think they are ready for it, we will withdraw completely. On the other hand, the Republicans approve the position our Government has already taken. They hold that the question of independence must be left

to the future; that we should not make such a promise to withdraw as England made as to Egypt, or we made as to Cuba, and which it may not be wise to fulfil, and which the people may not wish us to fulfil. It may be better, so say President Roosevelt and his supporters, that in the end the Philippines should be self-governed, but as in the cases of Canada and Australia, not be independent. They may find our protection best for them and prefer to be a part of the great imperial American Republic. To promise independence now might, they say, be a great injury to the Islands, might stir up restless ambitions and seditions before the people are ready for safe independence. Thus the two parties are aligned, not at all on the question of self-government, not at all on their desire for the welfare of the people there, but as to the wisdom and safety of this one particular present decision of our Philippine policy. Which is right?

We hold with President Roosevelt, and, we believe, the great mass of our intelligent people, with the unanimous agreement of all who have visited the Islands, and with the judgment of foreign students of colonial affairs, that it is not wise now to make the promise which it may not be wise to fulfil, and which the people may not wish fulfilled. The reasons are clear.

They are, first, that we are in no condition to make the promise. We do not know that within any near or approaching period the people will be ready for independence, or will want it. We are only just now compiling the results of the first census. It will be some time before the Philippines can meet in their first representative legislature. They are not yet acquainted with each other. It is not yet clear how they will be able to consult together. They have no common language, not one-tenth of them know any Spanish, and we are compelled to teach them English, which is the *lingua franca* of the East. There is at present no way of finding out what they want. To make our irrevocable decision now of what we will do is no part of wisdom.

Again, we should be slow to set up a new and small government, because the present best movement of the world is toward aggregation and not segregation. A multitude of small states tends to war; combinations in large governments tend to peace. We are moving toward a federation of the whole world, and the growing aggregations help it on. As a part of a great Power the Philippines will be much safer from invasion and war than they would be if independent. It would be almost inevitable, if they should become independent, that they should be swallowed up by Russia, or Germany, or Japan; and who believes that such a fate would be better for them? It would lose them the English language and the best form of liberty on the face of the earth. In the tendency toward consolidation they could hardly maintain independence long, and do we know any consolidation that would be better and freer for them than ours?

But it is said we could protect their independence. Perhaps; but it would be much more difficult and delicate thus to protect them than as a part of our own territory. It would be a strain on the Monroe Doctrine to extend it to the other side of the world. We should be much more likely to be involved in war if obliged to defend an independent nation across the ocean. Now our rights are clear; then they would be doubtful and denied.

Further, and finally, the experience of all the nations that have colonized the East shows that no other Power, should it get possession of the Philippines, would give them the self-government which we are giving, and that the people of those Islands are already receiving from us lessons in self-government and promises of freedom to rule themselves such as no other nation has ever granted in the East—not the Japanese in Formosa, nor the Dutch in Java, nor the French in Anam, nor the Russians in Saghalien, nor the Germans in Shantung, nor the British in India. An admirable article by Secretary Taft in *The Churchman* marks the contrast. We are the only nation that has tried to educate our colonies. Usually it is the policy to keep the people subsmissive by keeping them ignorant. In the Straits Settle-

ments but one-fourth of one per cent. are under instruction; in Java one twenty-fifth of one per cent.; in India, after 125 years of British control, only 1.37 per cent.; while in the Philippines, with only four years to do it in, we have now enrolled 263,000 pupils out of 8,000,000 population, or 3.3 per cent., and the number rapidly increasing, with a complete educational system. We found the population with no common language, no common sentiment, no education except for a very small class. We give them a thousand American teachers, normal schools for native teachers; and in these four years we substitute civil for military government, establish local self-government, teach the people much faster than foreign visitors think safe the lessons of freedom and self-government. In 900 municipalities the people have received the extraordinary gift of complete autonomy. In more than 40 provinces the people elect a part of the Board of Government. In the Supreme Commission, which governs the Islands, there are three Filipinos sitting with the American members. Next year will be called the first popular Assembly of the Islands, to be one house of their Congress, the Commission to be the other. Already native Filipinos have their place, with Americans, on the bench as judges. The progress in granting self-government is amazing, to which no parallel approaches. Can we go faster than we have gone? We are ruling the Philippines for the Filipinos; we are teaching them to rule themselves; must we now promise them that in the near future they shall be entirely independent of the United States and be left to themselves? Wise men do not think it safe, do not think it best.

Military Marriages

THE efforts of General Corbin to prevent young officers in the army from marrying call attention to one of the evils of militarism which is of more importance than those of which we are daily warned. A similar rule or custom inhibits marriage in the ranks. We do not believe that our relatively small standing army will aid in establishing a military despotism; but that from fifty to a hundred thousand young men, picked as physically fit by careful examination, should be withheld from the duties of matrimony and parenthood, inflicting an equal deprivation on the same number of young women, is an injury to the nation not hypothetical but real, not prospective but present. To make celibacy compulsory and chastity optional is to put a premium on vice, and vice is something that does not need premiums to increase its circulation.

The case is still worse when the officers of the army, selected from hundreds of applicants by competitive examinations in every State and educated at our expense, are prevented from leading the normal and wholesome lives of ordinary citizens. They receive an income equivalent to that of young lawyers, doctors, teachers and ministers, who have spent a similar time in educational preparation, and public opinion favors, and in some cases demands, the marriage of these professional classes.

The real reason why the young officer in the army and navy cannot support a family is because he is expected by custom and those in authority over him to spend more on show and luxurious living than any man should. With an income of $1,500 he is practically required to live on the scale of men who spend $3,000. In the same line is Admiral Sampson's refusal to promote to the rank of naval officers men who have not had training in the etiquet of fashionable society. That is, the country is to be deprived of the services of an unusually efficient mechanician because he is not habituated to a particular set of social forms and usages, all of them arbitrary, many of them unreasonable and some of them objectionable.

It will not be long at this rate before it will be here as it is in England, where no man can be an officer in certain regiments unless he is rich, and as it is in Germany, where the Government has to pass upon the dowry of the prospective bride before an officer is allowed to marry her. The natural result will follow here as there. Army men will tend to become dissipated, idle and inefficient, and continually more out of sympathy with the people whose servants they are. There will be a crop of excellent literary material for American Lieutenants von Bilse

to write "The Story of a Little Garrison." We want a strong, active and efficient army, not a military aristocracy.

The Employer's Business Agent

One result of labor uprisings of the past few years is a better understanding of the walking delegate. The unions prefer to call him the "business agent." He is really the imperfect substitute for an officer whom the employers themselves should long since have created. It is a curious fact that great corporations employ the highest paid talent as heads of their purchasing and sales departments, their mechanical departments, their legal and scientific departments, but leave their labor department to subordinates called foremen. Not until this neglect has brought a labor union on their hands with its unpolished business agent do they realize that they have not known what was going on in their most important department. But it is then often too late to make amends. The business agent comes with "demands," and no matter whether they are just or unjust, they cannot be granted, because discipline will be undermined. The foremen and superintendents must be sustained. If the union wins in the strike that follows then the business agent or other union officer becomes the head of the labor department. The question becomes, not whether that department shall have a responsible head or not, but whether the head shall be responsible to the owners or to the workmen. The board of directors is compelled to take up the labor question and not to leave it longer to subordinates.

This explains why it is that several corporations and associations of employers which have suffered from labor troubles have begun to employ their own "labor commissioner" to handle their labor department. Mr. Patterson, of the National Cash Register Company, in accounting for the seven weeks' strike in 1901, which occurred in spite of the notable "welfare work" on behalf of their employees, says:

"A few of our forty-two foremen did not treat their men properly preceding the strike. We had no labor bureau to settle disputes. Sometimes they were attended to by one or more of the heads of the various departments, and sometimes by the general manager or by the board of directors, or the factory committee. Previous to the strike we did not call meetings of the rank and file of our employees to explain to them our side of the questions at issue, as we do now."

It is a fact that in the United States the captains of industry, the directors and leading stockholders of great corporations are well disposed toward their employees and unwilling to have them subjected to oppression. But even when they are able to turn from the commercial side of their undertakings it is impossible, even with the best of intentions, for them to get an honest expression of opinion from their employees. They hear only from those who wish to ingratiate themselves, and a workman who complained of his foreman could not hold his position. Industry on a large scale has separated the worker from his employer in a real sense that very few employers appreciate. The labor commission or labor bureau is the necessary link for getting this honest communication between the top and the bottom of the industrial structure. The workman thereby is protected against discrimination by his foreman and his real grievances are remedied, while his fancied grievances are explained.

Of course, everything depends on the personality of the commissioner. He is responsible directly to the president and board of directors, and his power is coordinate with that of the foremen and superintendents. Such a position is a delicate one, requiring great tact, independence and that common sense which can treat each case on its merits without preconceived notions of abstract rights. When a corporation or an association selects a lawyer for such a position it is evident that the intention is not to conciliate or to admit that there are any real grievances, for a lawyer is trained to see only his clients' cause. The successful labor commissioner is as much an expert in dealing with labor as the salesman is an expert in dealing with customers. He is the employers' business agent, selected for his peculiar qualities in handling the chief department of the employer's business. Employers have found him to be a necessity after unions have gotten hold. He is even more valuable before the establishment is unionized or after the union has been made powerless.

Violent Exercise and Health

THERE is a curiously interesting difference of opinion between physicians and the directors of physical training departments of various kinds in universities and in connection with clubs as to the effect of severe exercise upon the health. While there is a general impression that violent exercise by developing muscles, giving wind, providing endurance and the like adds to the resistive vitality, physicians have for years insisted on the likelihood of indulgence in violent exercise, especially during the period before the full growth is attained, proving an injury rather than a benefit to the constitution. This was emphasized at the last meeting of the American Medical Association, held at Atlantic City, where, in the section on medicine, a number of prominent medical authorities emphatically asserted that present day methods of encouraging violent exercise among university students are almost sure to have disastrous results in the after life of the rising generation.

The reasons for this opinion were stated very plainly. The subject under discussion was arterio-sclerosis, or, as it is sometimes called, arterial degeneration. The old proverb, "A man is as old as his arteries," means that the best index of diminishing vitality is the condition of the arterial walls. When the arteries begin to degenerate a man is growing old, no matter how few the years of his age. On the other hand, it matters not how old a man is, if his arteries still retain their elasticity he is not going into senile decadence and there is ever promise of many years still ahead of him. There is universal agreement among physicians that the most important factor in the production of premature arterial degeneration is hard physical labor. This is especially likely to have serious effects upon the arteries when it is begun during the early years of life and continued during adolescence. If a growing boy has had to exert his physical powers to their limit during much of the working hours of the years between fifteen and twenty, then he is almost sure to present the signs later in life of premature arterio-sclerosis.

This means that at about the age of forty to forty-five his arteries, instead of being the soft, flexible tubes they should be, which can be readily rolled under the finger without any special resistance, show signs of thickening and of lengthening, which gives them a peculiar tortuous appearance and feel. It is not hard to understand why this should be the case. The arteries form an important dynamic element in the circulation of the blood. When the heart forces the blood from the ventricles into the arteries these do not receive the fluid as so many inactive tubes, but they are distended by the pressure exerted by the heart, and when the valves close in order to give the heart the opportunity to refill itself and force blood out once more the arteries contract and so push the blood along, keeping the stream of the circulation continuous. It is easy to comprehend that in the as yet incompletely developed youth the arterial walls may easily become overstretched. If this does not happen, at least they develop an especially luxuriant muscular coat in order to enable them to accomplish the additional work unseasonably forced upon them. Later on, if the severe exercise is no longer demanded of them, a certain amount of degeneration occurs, and as a consequence the arteries lose their elasticity.

According to some of the best medical authorities in America this is just what happens in the case of young persons who exercise too violently, whether that exercise be of the pleasant order called sport or of the unpleasant variety called work. The effect is the same if the strain is put upon the circulatory system. Hence it is that the tradition has become rather firmly established that athletes are not especially long lived. While as a rule they are the picked men of their generation, with physical constitutions that would seem to insure them length of life, so that every one involuntarily has a thrill of envy at their possibilities of continued good health, they not infrequently break down in early middle life and exhibit a lack of resistive vitality against such infectious diseases as typhoid fever and pneumonia that soon thins their ranks and leaves the survivors to a good old age only few and far between. It is not the athletes as a rule

who live longest, tho their original endowment of strength would seem to promise this. On the contrary, they do not live proportionately nearly as long as their weaker classmates.

Of course, these expressions of the physicians at Atlantic City, most of whom it may be said in passing were neither old nor old fogyish and some of whom are deeply interested in athletic sports as such, will probably have very little effect in lessening the severe training indulged in for athletic sports during the coming university year. It is well, however, to have a straightforward opinion like this plainly set forth, in order that we may realize just what are the dangers ahead in these cases. It is possible that physicians exaggerate the evils, or are mistaken in their estimate of the possible longevity of athletes. It is much more likely, however, that the present fad in this matter is carrying young people much beyond the bounds of reason and has unfortunately so infected the minds of those whose influence should be used to prevent the abuses that in spite of warning and even forebodings on the part of the members of faculties the abuses are allowed to continue. It would be sad to think that a movement that has been welcomed as likely to produce the best possible effect upon the health of the rising generation should, because of certain exaggerated features in it, prove a source of serious evil.

The Bishop of Laval

DURING the past month French and English newspapers have given out data about and from Mgr. Geay, the ex-Bishop of Laval, well worthy of study. In the first place, his audience with the Cardinal Secretary of State Mgr. Geay calls the most painful of all his trials. Old enough to be the father of the young Spaniard who sits at the Papal helm, the deposed Bishop found himself "face to face with a presence colder than the marble of a tomb," a presence which reminded him of a Spanish inquisitor. To every statement of the prelate the youthful Secretary had but the one word: "You must tender your resignation." When Mgr. Geay asked if the Holy Office would produce the proofs of his immoralities, Cardinal del Val, with a shrug of the shoulders, answered: "Oh, if that were all! But you have revealed to the secular arm the secrets of the Church." There lay the Bishop's offense. He might have wandered far astray if he only had been a monarchist. The surrender of the crosier of Laval, not the healing of any immoral stains, was what the French royalists were after. It was not immorality that Rome was worrying over. But to hold the Papacy bound by the Concordats, to which it is a cosigner, is a crime.

Passing from the Secretary of State to the Holy Father, the sorely tried Bishop met a man of his own years, who had labored, like himself, in parish work and had risen from the ranks. In Pius X he found no Spanish inquisitor, or Roman, or Neapolitan, or Sicilian, but an Italian of that North in which center chiefly the hopes of United Italy. The two men soon reached an understanding. Mgr. Geay resigned after the Pope had spoken thus:

"I have not condemned you, nor do I condemn you; but I ask you not to let a trial be continued before the Holy Office which, while entailing an indefinite sojourn here and humiliating formalities, would in any case result in your resignation, which has been irrevocably decided upon for the peace of the diocese and the triumph of the Church. Your enemies are powerful and implacable. They will not permit you to exercise your ministry in that tranquility which is needful for the salvation of souls."

Here, then, is the case in a nutshell: It was not a trial Mgr. Geay would face, but a foreordained condemnation. And this is the twentieth century!

Next appeared a letter, dated the Vatican, August 30th, of the Cardinal Secretary of State, Merry del Val, who writes that the Pope accepts Laval's resignation and adds that His Holiness will give Mgr. Geay a titular bishopric. He then goes on to say:

"I have only to add, Monseigneur, how much the Holy Father values this act [of resignation], spontaneously done and truly worthy of a French Bishop sincerely attached to the Holy See and filled with the sentiments of filial affection for the Vicar of Jesus Christ which you have always professed."

We rub our eyes, as if awaking from a dream, when we recall the Cardinal's

former letter, as well as the presence colder than a marble tomb or symbolic of Tonquemada or other Spanish inquisitor, and also when we remember the cruel order of Cardinal Vanutelli calling on the Bishop of Laval to resign without appeal. We wonder if the Cardinal Secretary of State takes himself seriously or expects others to do so. Mgr. Geay of his own accord resigning! Mgr. Geay flitting to Rome to answer charges of immorality! Mgr. Geay condemned beforehand, not as immoral, but as a Republican! The modern Jonah, not so happy as he of Nineveh, sank himself and the ship in the whirlpool of political Bourbonism.

Lastly appeared the farewell letter of the Bishop to his one-time flock. Briefly the crosierless Bishop relates his interview with the Pope and the latter's refusal to condemn him, and then winds up with the usual platitudes on mutual prayers and episcopal blessings.

To sum up, Mgr. Geay was ousted not because he kept a woman, but because he did not—to quote his own words—

"brandish over the head of the Republic the Cross which she had placed in my hands . . . as a matter of fact, I signed my resignation on the day I was raised to the episcopate by banishing from my diocese the militant politics which were converting the priests into a Royal bodyguard. The representative of the Duke of Orleans swore that he would have 'ma soutane et ma peau.' Tho I still retain my miter, he has done his work well."

Imperialism and Union of Nations

When the United States began the acquisition of territory with no settled design of their erection into States of the Union it seemed to some that the country was entering upon a policy of Colonial Expansion, which would lead to the abandonment of our fundamental political principle, Home Rule, and the loss of that political virtue which has been our health and strength. So Imperialism became an issue in national politics—the paramount issue in one campaign, tho the silver issue was so mixed with it that it lost that opportunity of being put to a vote on its own merits. Tho still mentioned in platforms, it is hardly possible that Imperialism will ever be passed upon by the people untrammeled with other issues. It will have to take its place among those questions which time, not immediate political action, must solve.

But by taking even a casual view of world politics it will become obvious that this Imperialistic step by the United States was simply one of the last acts in the political drama upon which the curtain is about to fall; not the opening scene of a play in which the United States is to be the leading actor. England was the star of the Colonial drama, and she played her part so well that, as the century was closing which witnessed the development of her vast colonial system, there was but a small remnant of territory left that could be taken by the United States or fall to it by the fortunes of war. There is no world to bring under the authority of the United States, as colonies, even if our people could be permanently carried for that policy. The Colonial Era is over, and the Era of International Organization on the American doctrine of Home Rule has begun. Therefore, the representative of the colonial idea must decrease, and the representative of the Home Rule idea must increase, by continuing to lead in the organization of contiguous governments on this enduring principle.

Formed by the union of a few States on the Atlantic seaboard, the United States in its first century of existence was destined to expand so as to reach the Pacific and the Gulf, and to define the boundaries of the States and of the Federal Government, in their jurisdiction, by conflict of thought in conventions, congresses, courts, and finally on the battlefield. And when the United States shall have organized into States all its possessions it will have attained its full, natural growth. Its first century mission will be fulfilled, and it will be called to the larger work of organizing the nations into one Union, each sovereignty becoming one member. Unless we take this step, our growth is ended. By taking it we accept our place in the twentieth century world—membership in a Universal Government, organized on the principle we have proven correct. By leading in the perfecting of this Union we shall

prove ourselves worthy of our inheritance from the past and of the opportunities of the present. The greatest nation in the Union will be that one which was most influential in rightly constructing it, not the one with widest area or largest population. In the swing of this world-wide reformation on the basis of Home Rule, that principle will be more and more perfectly applied, not only within our own nation, but within the British Empire and other nations. Certainly the United States, while taking her part in this work, by application of our fundamental principles of Government, cannot be deluded into abandoning these principles in order to enter upon a fruitless effort at a Colonial System after the Colonial Era is over and the Era of International Organization has come. Imperialism will, therefore, be prevented from going further, and will be solved in so far as it has already become a fact by this work of uniting all the world into one political body, with many members fitly joined together, on the basis of Home Rule.

As has been pointed out in various articles in THE INDEPENDENT during the past year, this Union has already been formed, without any general realization of the fact or of its significance; for the establishment of The Hague Court really constituted this Union a living political organism, tho very imperfectly formed. The political work of the future will therefore be the development into perfect form of this imperfect Union and the granting of proper power to its several parts. This is the work of the new series of meetings of the nations which it is hoped will follow the call to be sent out by President Roosevelt. The Peace Congress in Boston this week, altho its main purpose is to put an end to war, can find no better way than by this federation of the world, with its center at The Hague.

Simple and Strenuous

The French preacher Charles Wagner, of the gospel of the simple life, and Theodore Roosevelt, the preacher of the strenuous life, spent a long, delightful evening together last week. They found themselves brothers in unity, simplicity and strenuosity mated. And why not? We know little of the strenuous, of which there may be much, in M. Wagner's life, but all the world knows that Mr. Roosevelt is as simple as he is strenuous. No man cares less for show. He can be as easy and contented on a Western ranch as in the White House, and can satisfy his hunger as well over a pot of beans at a soldiers' bivouac as before a *chef's* courses of concoctions and wines. In fact, a strenuous man has little time to be anything but simple. He cannot stop to dawdle. The Roosevelts' home life is simple, whether in Washington or at Oyster Bay. We do hear of their riding horseback, of their vigorous and healthful amusements as well as work, but never of anything that would be called luxurious, no searching after and surfeiting of pleasures. So the two apostles of action and contentment found no quarrel between them, but found that both were devoted to what Oberlin College, and Wordsworth before it, called "plain living and high thinking." While such men live and are honored we can never say what Wordsworth said of London more than a century ago:

> "The wealthiest man among us is the best;
> No greatness now in nature or in book
> Delights us. Rapine, avarice, expense,
> This is idolatry; and these we adore:
> Plain living and high thinking are no more
> The homely beauty of the good old cause
> Is gone: our peace, our fearful ignorance,
> And pure religion breathing household laws."

The world is better than it was in 1802, *teste* Wordsworth, Wagner and Roosevelt.

The Episcopal Convention

The Episcopal General Convention meets this week in Boston. As it is a governing body it has matters to settle besides enjoying the honor of the presence of the Archbishop of Canterbury, who will attend it, in good part to learn how, when disestablishment comes, the Anglican Church shall be governed. Among the questions to be decided or postponed is the election of a Presiding Bishop, instead of his serving by seniority, which often may mean feebleness. If elected for three years he may be re-elected, which looks toward a virtual Primacy. Another matter is the possible organization of provinces, which would

give a nominal, or titular, archbishop to each, and, finally, a Primate over all the provinces. This seems to be a normal development of the Episcopal system. Another is the appointment of suffragan bishops, now forbidden. The proposition is that these bishops shall have overlapping jurisdiction over nationalities or races, for Germans, or Swedes, or negroes. The negro clergy are especially pressing for a suffragan bishop of their own number. The name of the Church will hardly give much trouble, as it has been fully settled that no change will now be made. The marriage and divorce question will long be up. At this meeting of this convention the proposition will be to forbid the clergy to solemnize the marriage of any divorced person, even an innocent party, but not to exclude such innocent person, civilly married, from the Church sacraments. This is a self-contradictory proposal. If the marriage is so sinful that the Church cannot sanction it, then those who live in such marriage unrepentant are not fit candidates for the sacraments of the Church. It is absurd to say that a divorce is justified and not remarriage. The proposed plan is likely to meet opposition, and the effort to make religious laws stricter than those laid down by our Lord and his Apostles savors of the superserviceable zeal of those who "fenced the law."

James Bryce on Officials

We do not at all agree with James Bryce, who, in an address at St. Louis a week ago, advised the disfranchisement of officials as a cure of corruption. He would have every public officer, or member of an administration, or of a public service "excluded absolutely and entirely from participation in the ballot," and equally from the right "to canvass, or to speak, or to write, on any political subject." That is radicalism gone wild. The Republic is not yet so far *in extremis* that it needs that remedy. James Bryce is himself a Member of Parliament; should he be denied the vote? Or does he excuse himself, on the ground that as Member he draws no salary from the Government? Should then our President or Congressmen be denied the vote, or only their messengers and clerks? Only when all other ways of preventing corruption have been tried and proved unavailing, and the bribery is seriously endangering the state, should any such device be adopted; and then it will be too late. A man who holds a place in the Civil Service has as much interest in the welfare of the state as any one else, and his intelligence as well as his probity is above the average of citizens. A rule that would shut out a post office clerk or letter carrier and let in a saloon keeper and gambler's tout does not comment itself to sound judgment, and it stands no chance of being adopted.

A "Vexatory" Separation

The French Socialists, represented in the French Cabinet by M. Jaures, at first received M. Combes' speech at Auxerre announcing the purpose of separation of Church and State with great glee; anything to get rid of the Concordat and the Church. But their tenor changes, for they see that what he proposes is a concilatory and not a vexatory separation. They would like to have the parish priests as well as the monks driven out, and even the churches secularized. M. Combes sees that this would neither be prudent nor just. He would provide for the *curés* who are old or infirm, and believes it would be wrong to throw them adrift. The great majority of the people of France have a certain affection for their local churches, and they want to be married and buried ecclesiastically. Such a vexatory campaign against the Church as the Socialists would choose might create an uproar in France that might be a revolution. The Deputies will see this, and so will those of them who follow M. Jaures, altho now they are calling it treason to give moderate conditions to the Church, to pass over the religious edifices to the clergy, and life pensions to the old and feeble. But they will yield, and the *Bloc* is not likely to be broken.

George Meredith, novelist, is quoted in a London paper as favoring at some fu-

ture time a limited partnership in marriage, say for ten years. Why so long a period? Why not just as well five years, or one year, or one day? He thinks that if ten years were not long enough to provide for and educate the children, the State might take the task. That would be a pretty condition of things—children growing up with no family life, no knowledge of father and mother, grandfathers and grandmothers, no relatives responsible for one—all orphans in orphan asylums! And this is the improvement which extreme Socialism has to offer for the most blessed institution the world has ever known, the family. The alternative for life-marriage will be either utter license or polygamy. The alternatives do not commend themselves to us. We are much in the position of the Arab sheikh who was asked by Chief Rabbi Adler, of London, why he did not become a Christian. "All I would have to do," was the reply, "is to eat pork and get drunk, and I don't want to do either."

We are pleased, and not surprised, that the leading journal of the Episcopal Church in this country opposes the amendment to the Canons which the Joint Commission on Revision proposes for enactment at the meeting of the General Convention this week. The proposed rule reads:

"No person shall be permitted to officiate in any congregation of this Church, by preaching or by performing any priestly or ministerial act, without producing sufficient evidence of his having been duly authorized to minister in this Church."

The present canon forbids any such unordained person to "officiate," that is, to perform "any priestly or ministerial act," while the proposed canon also forbids him to officiate by "preaching," that is, by exercising the prophetic gift, which any layman may exercise. Men of other denominations have often been allowed to "preach," "prophesy" in Episcopal pulpits, and a stiffer rule will be sharply opposed in the interests of liberty as well as comity.

It is a very small thing which for the week has filled columns in the daily papers, the arrest and fining of a Secretary of the British Legation for speeding his automobile. He ought not to have violated the law, but, having done it, he ought to have paid his fine and made no fuss about it. But the lay judge who fined him having apologized, and the State of Massachusetts having done the same, and the United States ditto, and the young man having been rebuked by his Ambassador, and being in fear of a recall from London, the case is happily ended. A foolish youth, a fast auto and an uninstructed judge can make no bad blood between two friendly nations.

What can we do, as a nation, for the conflicts and massacres in the Mûsh district of Eastern Turkey, where our Consul at Harpût reports that 3,500 Armenians have been slain or died of exposure and want, and 15,000 robbed of all their possessions and left to suffer the approach of severe winter? Probably we can do nothing. It is very sad, but not yet are we called to right all the wrongs of the world. There are nations that have a direct duty of intervention in such a matter, but they are not succeeding very well in pacifying nearer Macedonia.

Why should not Greek keep its hold on American culture, at least in our colleges? We are glad to see that now the "Ajax" of Sophocles is to be given in the Greek Theatre of the State University of California, October 13th, and under the direction of the same Miss Mabel H. Barrows who made a hit in this city last winter in the same play, with native Grecks as players, whom she picked up here in very humble walks of life.

The action of the military commission of the Governor of Alabama, convicting of incompetency the militia who failed to protect a negro prisoner at Huntsville, Ala., and recommending that their company be disbanded, is the best action yet in suppression of lynching; or will be when the Governor approves that action.

Insurance

The Need of Credit Insurance

In an address before the American Bankers' Association Convention, held in this city the middle of September, Mr. W. E. Schweppe, manager of the bankers' department of the American Credit Indemnity Company, called attention to the perils that confront the merchant, and pointed out the necessity for credit insurance. Mr. Schweppe cited statistics to show that during the past eleven years the losses through insolvency have largely exceeded those arising because of fire losses. He estimated the total losses due to business failures to be not less than $367,000,000 for the period named.

The majority of firms doing a wholesale or manufacturing business have a tendency to overlook, in large measure, the menacing risk that constantly surrounds their credit business. Credit is altogether too easy, and the trend seems to be toward making it easier rather than more difficult. Even conservative merchants are frequently the victims of men having good address and a plausible manner. With such men the alphabetic precaution, which ought always to obtain, as to the securing of reliable information regarding the responsibility and character of the credit seeker is often neglected and the door is opened to losses which might have been avoided. So long as business conditions remain as they are now the need of credit insurance will not only remain, but will constantly grow greater and greater.

Serious Fire Hazard in a Rat Killing Device

A successful device for killing rats recently tried in a grain elevator at Rochester, N. Y., turns out to be a new and very dangerous fire hazard, in which underwriters may well interest themselves. The elevator in question swarmed with rats. Traps and poisons were tried in vain. The rodents increased rather than diminished. In a moment of inspiration the owner laid down narrow sheets of copper in such a manner that when the rats ate the cheese on one of these strips they were forced to stand on another copper strip. A powerful electric current was formed by an attachment made with the terminals of the elevator's electric light system. The result was the rats were killed in considerable numbers. The owner gave the matter publicity, and his plan is now being extensively utilized. In the case of short circuiting, however, the device becomes an exceedingly serious fire hazard, with unusually dangerous surroundings.

London Fires

One hundred and fifty-three fires were caused in London last year because children were allowed to play with matches. Oil lamps that were upset were the cause of 146 more. Two hundred and eighty-four fires might never have occurred had it not been for the careless use of candles, while sparks from fires caused 186 conflagrations of more or less magnitude. Electricity was chargeable with 54 fires. Gas lights and the contact of the same with curtains, blinds, etc., accounted for over one hundred fires, while escaping gas caused 133. The total number of fires in London during 1903 has been given by the *Insurance Journal* as 2,400.

It will doubtless interest accident underwriters to know the values recently set upon human beings and certain of their parts by juries in the Philadelphia Court of Common Pleas. According to a table printed in *Insurance* these are as follows:

Broken back	$15,000
One finger	5,000
Wounded heart	10,000
Broken knee cap	2,472
Broken arm, two broken legs and four broken ribs	10,000
Broken nose (fist inflicted)	500
Left leg	11,404
Left arm	8,500
Two broken legs	6,250
Ventral hernia	20,000
Husband, father of five children	5,000
Husband (white)	8,000
Husband (negro)	3,000
Twelve-year-old boy	2,000
Nine-year-old boy	1,500
Eight-year-old boy	2,000

....The Equitable Assurance Society announces through its official organ that it is a sure thing that the next President of the United States will be a policyholder of that company, since both Theodore Roosevelt and Judge Alton B. Parker carry assurance with the Society.

Financial

Canada's New Tariff Laws

In view of Canada's new legislation for taxing imported goods purchased at prices much below those prevailing in the country of production, and the political agitation in Massachusetts for reciprocity, the official returns of trade with Canada, published at Washington last week, are quite interesting. Here are the figures for recent years:

	Exports. to Canada.	Imports from Canada.
1890	$40,282,108	$39,042,977
1895	52,854,769	36,574,327
1900	95,319,970	39,369,074
1901	105,789,214	42,482,163
1902	109,642,993	48,076,124
1903	123,266,788	54,781,418
1904	131,274,346	51,406,265

Undoubtedly the recent rapid growth of our exports to the Dominion has been due largely to what is called the "dumping" of goods there at prices considerably lower than those our own people are required to pay for the same. Since June 4th the new Canadian law aimed at "dumping," and imposing a special tax equal to the "dump" discount, has been in force. On October 1st new customs regulations were made and new forms of invoices were adopted, both designed to facilitate the enforcement of this law, which in many instances has been evaded. It is not true, however, that the law has thus far been ineffective. Records at the Canadian custom houses show that the practice of exporting from this country to Canada at large discounts has been a general one, and large sums in special taxes have already been collected. It is expected in Canada that the protectionist device of a special tax will be imitated by European countries which complain of "the American invasion." Several of these countries, however, have been selling their own products abroad at large discounts.

The practice at which the new legislation is aimed has not tended to mold public opinion in Canada in favor of reciprocity. On this side of the line the demand for reciprocity with Canada is especially to be noticed in Massachusetts, where a petition in favor of it has been signed by many thousands of Republican voters, and where Senator Lodge is required continually to explain and defend his record on this question. In the Eleventh Congressional district, last week, Eugene N. Foss, a leading advocate of reciprocity, was successful in the Republican caucuses after a sharp contest. Canada's special tax will probably reduce our exports to the Dominion. Neither her Government nor her people now ask for a treaty of reciprocity. But there ought to be one. It would promote the welfare of the people of both countries.

It is estimated that the apple crop exceeds that of last year by 20 per cent. and may be equal to the record crop of 1896.

....Owing to the condition of the ocean freight business, two steamers of the American Line's Philadelphia service with Liverpool are to be withdrawn.

....After thorough trial the Burlington Railroad Company has decided to substitute the telephone for the telegraph in dispatching and operating both passenger and freight trains.

....The New York, New Haven and Hartford Railroad Company has added to its trolley holdings by the purchase of the electric roads in Middletown, Conn.

....Mr. Higgins, the Republican nominee for Governor of New York promises, if he shall be elected, to recommend the repeal of the tax on savings banks.

....The reorganized Shipyard Trust has bought in the Union Iron Works at San Francisco, where the "Oregon" was built, for $1,700,000. The new company will have a capital of $33,000,000, and it is controlled by Charles M. Schwab.

....Dividends and coupons announced:

Atch., Top. & Santa Fé R'way (Adj. Mort.), 4 per cent., payable November 1st.

Atch., Top. & Santa Fé R'way (Stamped Adj.), 2 per cent., payable November 1st.

Amer. Woolen Co., Preferred, 1¾ per cent., payable October 15th.

Minneapolis & St. Louis R. R. (Pacific Extension Coupons), payable October 1st.

Buffalo & Susq. R. R. Co., quarterly, Common, 1½ per cent., payable October 1st.

N. Y. & N. J. Telephone Co., quarterly, 1¾ per cent., payable October 15th.

The Independent

Vol. LVII NEW YORK, THURSDAY, OCTOBER 13, 1904 No. 2915

Survey of the World

Progress of the Campaign

By a vote of 3 to 1 the Supreme Court of Wisconsin has decided that Governor La Follette and his followers are entitled to be called the Republican party on the official ballots at the approaching election. This decision, which does not touch the merits of the factional controversy, is based upon a statute that empowers the State Central Committee to say which one of two or more factions is "regular." La Follette's convention and ticket have been supported by the Wisconsin State Committee. The Stalwart faction's nominee for Governor, Mr. Cook, has withdrawn from the ticket, but Ex-Governor Schofield has taken his place, and the Stalwarts will continue their fight. Some of the bolters will vote for him, some will vote for Peck (the Democratic nominee for Governor), and others will support La Follette. The prevailing expectation seems to be that Mr. Roosevelt will carry the State and that the re-election of Senator Quarles will be prevented.—Several Republican newspapers publish the statement that Chairman Cortelyou, as he was taking his leave of the President at the White House a few days ago, was overheard making the following remark:

"I think you are going to win, Mr. President, and if you do you can feel sure that this has been accomplished without the giving of any promise or assuming any obligation on the part of the National Committee to any corporation, interest or individual, either directly or indirectly."

The publication of this is said to have been suggested by recent attacks upon Mr. Cortelyou in the Democratic press with reference to the collection of campaign contributions. The gist of these attacks is the assertion that in applying to corporations for contributions Mr. Cortelyou is making use of a knowledge of corporation secrets, acquired while he was the head of the Department of Commerce and by authority of the law recently passed by Congress; also that he is making use of the fact that he is to be appointed Postmaster-General and will thus be at the head of a Department that makes contracts with the railroad corporations of the country for carrying the mails. In connection with this criticism it is asserted that all the Trusts are supporting the Republican ticket, and interviews with Mr. Armour and other heads of the great beef companies are published to the effect that such is their attitude.—In a letter to the Civil Service Reform League Mr. Cortelyou says that "the National Committee has not countenanced, nor will it countenance, directly or indirectly, any violation of existing law on the subject of the assessment of Federal officers for political purposes."—Judge Parker was asked last week whether he thought that "colored voters should be allowed the voting privileges which the Federal Constitution guarantees to them." His reply, as published by the Democratic press, was:

"I refuse to be interviewed, and I won't be. If you have done me the honor to have read my letter of acceptance you will find that that question has been covered."

His opponents deny that anything in the letter of acceptance covers it, and assert that the paragraph to which his friends point refers to the platform utterance concerning treaty rights and passports, a part of which is repeated in the para-

graph.—In a recent speech at Tuskegee, Ala., the home of Booker T. Washington, Congressman Heflin said:

"There they sat, Roosevelt and Booker; and if some Czolgosz or one of his kind had thrown a bomb under the table no great harm would have been done the country. . . . If Booker Washington takes a hand in this thing, it will be one time I will ask him to step out. I will ask him to take hands off, and you know we have a way of influencing down here."

Ex-Governor Oates says that these are not the sentiments of the best people of the district. Mr. Heflin asserts that his remark about the bomb was intended to be a joke, but he retracts no part of what he said about the use of "influence."—Mr. Bryan will make sixty speeches in Indiana during a period of ten days. Speaking in Omaha on the 3d he said:

"I need not tell you that I was not delighted with the nomination at St. Louis. I opposed the nomination of Parker, because he did not stand for what we had been fighting for in Nebraska for eight years. I stand to-day for every doctrine I have advocated. I have not recanted and have not withdrawn from where I stood."

But the election of Parker will, in his opinion, place the party in a better position to renew the fight for economic reform. — Connecticut's town elections show no change in the relative strength of the parties.—Visiting Democrats have urged Judge Parker to take the stump in the doubtful States, and especially in the West. Chairman Taggart announces the Judge's final decision that he will not do this, but will make at Rosemount such speeches as may be needed. "No entreaty," Mr. Taggart adds, "will budge him an iota."—Mr. Watson, the Populist candidate, asks Judge Parker to retire in order that he (Watson) may make a winning fight against the Republican party.—Postmaster-General Henry C. Payne, of Wisconsin, died at his home in Washington, on the 4th, of heart disease. First Assistant Wynne has been temporarily appointed in his place. It is well understood that after the election Mr. Cortelyou will be appointed to this office.

Panama's Complaint

Señor Obaldia, the Panaman Minister at Washington, has filed a complaint with the State Department concerning the action of our Government under the canal treaty. He has also been talking about it without regard to the rules of diplomatic etiquet, admitting that an appeal to The Hague Court had been proposed, and saying that "Washington ought not to be judge, jury and the whole court." The Legation's legal adviser, Dr. Morales, asserts that he has urged President Amador to appeal to The Hague tribunal. His story, as given to the press, is that the promoters of independence were assured, before the revolt, that they should have a treaty similar to the one which Colombia rejected, and that Minister Bunau-Varilla unexpectedly signed the present treaty before instructions reached him from the Provisional Government, Morales then being Minister of State. The treaty was not what had been promised, he says, and Bunau-Varilla was "false to the interests of Panama." Because the latter professed to exert great influence at Washington, and because Panama was unwilling to offend the United States, he was not recalled. Admiral Walker, he continues, consulted with Mr. Roosevelt and informed the Panama Government that the treaty "had been a way of meeting the criticism the President had incurred by his action in the Panama question," and that in the future a new and satisfactory treaty would be given. Because of that promise, Morales says, the present treaty was accepted by Panama. Admiral Walker enters a denial. Bunau-Varilla also denies, saying that his absolute power to negotiate and sign a treaty was in no way limited, and that he signed the present treaty three hours before the arrival of Panama's Commissioners in Washington, because there was nothing that called for a consultation with them. There was never any understanding, he adds, between the revolutionists and the United States Government. The formal complaint asks that all orders concerning tariff duties and the mails be suspended. Our Government, it is said, acts as owner of the zone and sovereign of it; has practically taken the ports of Panama and Colon, and has wiped out the Panama postal service and revenues. Local merchants suffer because the Dingley tariff gives

merchants in the zone an advantage over them. Ancon, the zone port, it is asserted, is practically the port of Panama. Goods entering the zone from Panama are taxed; goods entering from this country are not. Foreign goods received at Ancon for Panama pay the Dingley duties. The effect of the tariff regulations, it is said, will be to build up in the zone a city at the expense of the city of Panama.—Chile has virtually recognized United States sovereignty by applying to our Government, and not to Panama, for an exequatur to be given to Señor Ossa as consul of Chile in the zone. It will be granted.—Chief Engineer Wallace says that but little use can be made of the French company's plans, because the size of ships has increased by nearly 100 per cent. since the French company began work. New plans must provide for a canal much broader and deeper. Thousands of borings must be made, and a year may elapse before contractors can be asked to bid for work in the several sections.

Municipal Corruption in St. Louis

Charles T. Kelly, formerly Speaker of the St. Louis House of Delegates, who has been convicted of perjury and is soon to be tried for taking bribes in connection with street railway franchises, has published a long confession concerning the crimes of the "combine" of nineteen members, in which he was a leading figure. When Prosecuting Attorney Folk began his work, he says, the conspirators sought to intimidate him by threats of assassination. When these had no effect they laid traps for him, but in vain. Then they started a newspaper with the intention of harassing him by libels. Not only the men indicted, or soon to be indicted, took part in this work, "but also prominent financiers of St. Louis, who feared exposure, and those who had given us money." For votes in connection with the city lighting job the nineteen received $47,500 "at Julius Lehmann's birthday party." Scarcely a bill had been passed in the Municipal Legislature for twenty-five years, he says, unless it was paid for. "'We knew that in case of attack most of the politicians and many of the largest financiers of the city would be with us." Edward Butler, he asserts, paid him $15,000 to keep out of the reach of Folk's grand jury, and he went to Europe, but by a miscalculation returned two days before the date when the statute of limitations would run against prosecution in certain cases. Butler had promised him that the next Attorney (Folk's successor) would be "all right." Both Democrats and Republicans, he says, belonged to the "combine." Both parties nominate men "for the money they can make out of it." Each party votes for its own man, but the one who gets in "serves those who rob the city of franchises." He believes "this has been tolerated in St. Louis because so many of the large corporations are mixed up with boodling. The heads of these corporations used to think it less trouble to buy what they wanted than to elect honest men."—John H. Schettler, another member, has pleaded guilty to the charge that his vote for a railway franchise was bought, and has been sentenced to be imprisoned for two years.—While preparations were being made for the trial of Charles Kratz, one of the conspirators, a member of the panel of jurors made affidavit that Kratz's counsel had offered him $200 to vote for acquittal, saying that seven others had already been bought. Mr. Folk moved that the entire panel be dismissed.—The Chicago Council, by a vote of 36 to 31, has decided not to submit to the voters at the next general election the question "Shall the city proceed to operate street railways?"—In Buffalo seven aldermen have been indicted for taking bribes relating to contracts. An inquiry is to be made concerning allegations of corruption with respect to franchises and the purchase of sites for school buildings.

Automobile Racing on the Highways

An automobile race over a course on the highways of Long Island, a short distance from New York, on Saturday last, attracted much attention, for several reasons. The local authorities, as permitted by statute, had suspended the regulations limiting the speed of automobiles, and had ordered 30 miles of highway closed to ordinary traffic during the race.

Altho a majority of the residents approved this action, much complaint was made by others, and a Justice of the Supreme Court was asked for an injunction to restrain the local authorities and the Automobile Association of America. After a brief hearing an injunction was denied. The race—for road locomotives or racing machines rather than for ordinary automobiles—was for a cup presented for international competition, and the course of about 30 miles, around a triangle, was to be covered ten times. Several persons had recently lost their lives by automobile accidents in the vicinity of New York, and in testing his machine for this race one man had been killed on the selected course. France, Germany, Italy and the United States were represented in the contest, the winner being an American, George Heath, who used a French machine. His average speed for nearly six hours was 52 miles an hour. Over parts of the course the leading contestants moved at the rate of 75 miles an hour. Serious accidents were expected, and ambulances were stationed at several points on the course. One of them was used. In the second round Carl Meusel, a mechanician riding with George Arents, Jr., received injuries that proved fatal within a few hours, and Mr. Arents was sent to the hospital with a fractured skull Nine of the seventeen machines were crippled in the early part of the race. The frequent bursting or collapse of rubber tires was ascribed by some to nails and broken glass which had been thrown upon the track. Additional races of this kind are not desired by the daily press of New York.

Labor Questions

Work has been resumed at the factories of the Pullman Car and International Harvester companies, but with "open shop" conditions and with reduced wages. Labor agitators are said to have been excluded. About 9,000 men are employed In several plants of the Steel Corporation the wages of skilled workmen were reduced from 20 to 40 per cent. after the 1st inst., when the term of the old wage scale expired. At the hoop mills of the Corporation in Youngstown and Girard the company has declined to reopen negotiations with the union (Amalgamated Association) as to wages, saying that it has enough new men to keep the mills going. The union is said to have been warned that if it orders a sympathetic strike the Corporation will hereafter ignore the organization. Last week's conference between the manufacturers and the strikers at Fall River came to nothing. At a mass meeting the strikers voted not to accept the reduced wages and to insist upon a return to the old eight-loom system.—In a circular letter to heads of departments the Carnegie Steel Company (a part of the Steel Corporation) directs that no man over 35 years old shall be taken into the service in certain departments, and that the limit in others shall be 40 years. This order affects many expert workmen. On the Pennsylvania Railroad lines west of Pittsburg several hundred men have lost employment under a new order that no one is to be retained who was hired after he reached the age of 35.—Judge Gray's decision in the dispute between the anthracite miners and their employers is in favor of the miners and to the effect that check weighmen shall be employed wherever a majority of the men ask for them.—Within the last two weeks there have been two school strikes in Chicago, a considerable number of the pupils in the Sherman and McAllister public schools declining to enter the buildings, and by picketing, threats and even violence excluding all others. In each case the revolt was due to a false report that a negro teacher had been employed.—Before the annual Musical Festival in Worcester the unionists in the Boston Symphony Orchestra declared they would not play with Heinrich Schuecker, a non-union harpist. After some delay he joined the union. It is stated that the union also compelled the managers to substitute Carl Ondricek for Otto Roth as concert master.

The Philippine Islands

At a banquet given in Manila by the Federal Party to the Honorary Commissioners who recently visited the United States all but one of the Com-

missioners spoke for setting up a popular legislative assembly at once and for independence at an early date. Victorina Mapa, a Justice of the Supreme Court, dissented, advising the islanders to have confidence in the people of the United States and to prepare for independence by education. A radical address was made by Señor Sandiko, formerly a member of Aguinaldo's Cabinet, who called for immediate independence. Governor Wright answered the speakers in an earnest address. Admitting that with opportunity and experience the islanders were "capable of better things," he said that the Americans were in the Philippines as the result of an accident, the victory of Manila Bay. They found themselves charged with the responsibility of government and felt it their duty to take care of the country until its people should develop a capacity to take care of it themselves. It was true that it was the purpose of the American people to assure to the Filipinos the greatest degree of liberty:

"Is it not true that you now elect your municipal and provincial officials, and that a greater number of employees of the Government are Filipinos? Have you not three representatives in the commission itself? How many more centuries would you have remained here under Spanish rule before you would have enjoyed what you have gained under six years of American occupation? How often do you think it would be possible for the Federal party to give a banquet where the guests could talk freely of independence? Much as we endeavor to do for these people, you can readily understand how any distrust or hostility would interfere with the good work we have just started."

A call for a mass meeting in support of independence was published, asserting that the "best element of American society" desired that the Filipinos should attain the object of their ambition. But the meeting, held last Sunday, was a failure, as only a few natives were present. Bishop Brent, for three years at the head of the Episcopal missions in the islands, supports the policy of the Government and deplores any use of the question of independence in partisan politics.—The Augustinian friars decline to be bound by the agreement made by the late Pope Leo, the late Archbishop Guidi, and Governor Taft providing that the money to be paid for their lands should remain in the islands. They request that payment be made in drafts on London. Our Government cannot be a party to any controversy of this kind; the issue is one between the Vatican authorities and the orders. It was supposed to be the purpose of the Vatican authorities, in stipulating that the money should be paid in Manila, to make sure that it would be used for the benefit of the Church in the islands. The Augustinians evidently desire to take their share with them to new fields of labor. Therefore our Government will so deposit their share, about $2,000,000, to the credit of the Philippine treasurer, that the warrant to be issued by him will be good in London, New York or Manila.

The Marseilles Strike

The great strike of the dockers and coal handlers of Marseilles seems to have virtually come to an end. Altho it is not officially declared off, over 2,000 of the men have returned to work under the protection of a large force of infantry and cavalry, who guard the docks and patrol the streets. The chief point at issue between the employers and their workingmen related to the interpretation of the contract of 1903. After the strike had lasted for a month it was agreed on both sides to leave the questions to an arbitrator, and M. Magnan, a former president of the Tribunal of Commerce of Marseilles, was selected to act in this capacity. But when he gave his decision the dockers refused to accept it. M. Manot, the leader of the dockers, who had done most to organize the men into a union and who on account of his supposed power was called "the emperor of the quays," begged the five thousand strikers assembled in the Labor Exchange to abide by the arbitral judgment, as they had agreed to, and, together with all the other members of the Executive Committee, threatened to resign if it was repudiated. The strikers thereupon passed a resolution thanking the members of the Executive Committee for their services and accepting their resignations. The coal handlers' union followed the example of the dockers in refusing to accept the decision of the arbi-

trator. The ground on which it was rejected was that "by the conditions it imposed it was a menace for the labor unions and a daily cause of conflict." The chief objection made to it was that it did not bind the employers to hire none but union men, and did not prevent them from blacklisting the workingmen. At the same time it expressly forbade the workingmen to refuse to handle goods from "unfair" or non-union firms and factories, as they had been doing. The action of the strikers in refusing the arbitration to which they were pledged caused public opinion to turn against them very strongly, and gave support to the claims of the employers that no reliance could be had on agreements with unions and that the workingmen could only be dealt with as individuals. M. Pioch, general secretary of the National Federation of Dockers, came to Marseilles to remonstrate with the strikers for their repudiation of their agreement, but to no avail. Many of the men, however, declared their acceptance of the decision of arbitration and returned to work as individuals under the contract of 1903 as before. Under the patronage of the employers' associations these men formed the "Maritime Union" in opposition to the union which favored the continuance of the strike.

The Russians Turn

At last it is reported that the Russians will retreat no further, but will take the offensive and move south against the Japanese at Liao-Yang. General Kuropatkin has issued an address to the army, dated Mukden, October 2d in which he recounts the history of the war, since "more than seven months ago the enemy treacherously fell upon us at Port Arthur before war had been declared," and down to the recent action at Liao-Yang when

A Company of the Left Wing of the Japanese Army in Position to become a Charge of Russian Infantry
From Stereograph Copyright, 1904, by B. L. Singley

"after successfully defending all advanced and main positions you withdrew to Mukden under most difficult conditions. Attacked by General Kuroki's army, you marched through almost impassable mud, fighting throughout the day, extricating guns and carts with your hands at night, and returned to Mukden without abandoning a single gun, prisoner or wounded man, and with the baggage train entirely intact.

"I ordered the retreat with a sorrowful heart, but with unshaken confidence that it was necessary in order to gain complete and decisive victory over the enemy when the time came.

"Heretofore the enemy in operating has relied on his great forces, and, disposing his armies so as to surround us, has chosen as he deemed fit his time for attack, but now the moment to go to meet the enemy, for which the whole army has been longing, has come, and the time has arrived for us to compel the Japanese to do our will, for the forces of the Manchurian army are strong enough to begin a forward movement.

"The illustrious head of the Russian land, together with the whole of Russia, prays for you, blesses you for your heroic deeds. Strengthened by this prayer and imbued with consciousness of the importance of the task that has fallen to us, we must go forward fearlessly, with a firm determination to do our duty to the end, without sparing our lives.

"The will of God be with us all."

The Russian advance movement began with the occupation and rebuilding of Sakkhe station and bridge on the railroad 15 miles south of Mukden. Next, the Japanese outposts were pushed back nearly to the Yentai mines. Then Bentsiaputze on the extreme right of the Japanese north of Pensikou, where they crossed the Taitse River, was captured by the Russians, who occupied a high hill still further to the east and forced the Japanese to evacuate the town with some loss. This forces back the Japanese right, but on the left they are supposed to have been making a strong advance on the western side of the Hun and Liao rivers in the direction of Sin-Min-Tun, and this force will have to be reckoned with before the Russian can advance very far toward Liao-Yang. The Russian soldiers are in heavy marching order with an equipment weighing nearly 100 pounds and comprising knapsack, overcoat, rifle, cooking vessel, cartridge case, wooden water bottle and ax or spade.—General Stoessel reports from Port Arthur that the Japanese made frenzied assaults on the fortifications from the north and west from September 19th to 23d, but were repulsed with the loss of 10,000 men. Their only success was in the capture of the water works, which is not considered serious, since there are wells, condensing apparatus and a fresh water pond within the lines. The chief attack was made on High Hill, between Pigeon Bay and Itse-shan, and west of the city. The Japanese captured the armored trenches after terrible fighting on both sides, but during the night Lieutenant Poggorsky, of the navy, with a detachment of volunteers, descended upon them and blew up the trenches with gun cotton bombs.

The French in Morocco

France and Spain have at last come to an agreement in regard to Morocco and the paper embodying it was signed at Paris on October 7th by M. Delcassé, the Foreign Minister, and Leon y Castillo, the Spanish Ambassador. The exact provisions of the agreement are not made public, but it is stated that Spain has withdrawn all objection to the Anglo-France agreement of April 8th, according to which France was to have a free hand in Morocco in return for the same privilege granted England in Egypt. France recognizes the interests of Spain in her fringe of settlements in Morocco along the Mediterranean. Spain agrees never to cede these to any other country than France. Both countries agree to uphold the integrity of the Moroccan empire under the sovereignty of the Sultan. France has now practical possession of the largest contiguous area in Africa, with valuable ports on the Mediterranean, the North Atlantic and the South Atlantic. The French are quietly strengthening their hold over Morocco in many ways. A mission under M. St. Réné Taillandier, the French Minister at Tangier, will soon start for the capital to arrange with the Sultan for the reorganization of the army under French officers. The customs and police in

Northern Morocco are already in the hands of the French. In the interior along the vague and undefined Algerian frontier General Liautey is pushing forward the French military outposts to the east and south under such urgent circumstances, he says, that it was necessary to take such action without delaying to communicate first with the Governor-General to obtain his consent. M. Delcassé has decided that it is not wise to order the evacuation of these posts.

Southwest Africa

The rebellious natives in Southwest Africa are by no means quelled. On the contrary, the spirit of revolt seems to be spreading, and tribes further to the south and also in the Portuguese territory on the north, which have hitherto been accounted friendly, are now on the warpath. General von Trotha reports to Berlin that it is becoming increasingly difficult to follow the Hereros further into the interior toward the southwest because of the difficulty of supplying the army with provisions and water across the desert plains and of keeping up communications with headquarters in a country so flat that signaling is imposible. It is officially stated that 8,000 German troops will be sent against the Hereros. The Witbois tribesmen have risen in the southern part of the colony and have attacked stations on the Fish River. The Witbois have been acting as allies of the Germans and serving as scouts in the present war, but these have now all deserted and taken the field against the Europeans. Other tribes, as yet peaceable, are being roused by envoys from the Witbois and Hereros. In Portuguese West Africa a detachment of 500 troops sent against the Cuanhamas were surprised in the night while crossing the Cunene River, which divides the Portuguese from the German possessions, and over half of the force were slaughtered by the natives. This, taken in connection with the Herero war, indicates a very serious outbreak, and a force of some 5,000 men will be organized at once to suppress the Cuanhamas. Should the revolt spread to other tribes in the Portuguese territory of Angola the situations of the Europeans would be precarious, since they number only about 4,000 in a population of at least 4,000,000. The Bunda race, to which most of the natives belong, have in the past shown the ability to form tribal federations of considerable extent and power. In the interior the natives retain their warlike spirit and customs, but along the coast they live in practical slavery on the plantations, and there has been very extensive amalgamation with the Portuguese, who have possessed the land for over 300 years.

The Kongo Atrocities

The task of calling the attention of the world, and particularly of the British Government, to the atrocities committed by the Kongo Government belongs to the Kongo Reform Association, of which E. D. Morel is honorary secretary. It has just sent to the British Foreign Office a communication which shows the character of a commission of investigation appointed by King Leopold, July 23d. This commission was appointed in response to a request from the British Government, as Great Britain is one of the Powers which established the Kongo State. The Marquis of Lansdowne had particularly expressed the desire of the British Government that the investigation be impartial, thorough and public, made "by a tribunal of recognized competence and impartiality." The Peace Congress meeting in Boston last week devoted much attention to the Kongo question, and finally resolved that in order to determine who was responsible for the abuses of power in Africa the following questions should be submitted to a conference of the Powers concerned in the formation of the Kongo Free State or to the Court of Arbitration at The Hague:

"Is the Government of the Kongo Free State still to be regarded as the trustee of the Powers which recognise the flag of the International Association?

"What is the position of the Kongo Free State in international law, and in what manner may the grave questions concerning its alleged actions be satisfactorily and competently determined?"

President Roosevelt has not as yet given a definite reply to the petition of philanthropic societies that he demand an investigation into the administration of the Kongo.

The People's Party's Appeal

BY THOMAS E. WATSON

CANDIDATE OF THE PEOPLE'S PARTY FOR PRESIDENT OF THE UNITED STATES

A FEW days ago, at a Labor Day meeting, I listened to the address of the Socialist candidate for Governor. Waving his arms in the direction of the magnificent city spread out before us, he said:

"All that is yours; go and take it. Don't take a part of it; take it all. Don't be satisfied with a loaf; take the whole bakery."

That his remarks represent a real and powerful sentiment was proven by the hearty applause which he received. His position marks the limit of one extreme; at the other extreme stand the "Public be damned" crowd, well represented by such men as Baer, Morgan, Rogers, Rockefeller, Carnegie, Belmont and Company, to whose hands "God in his infinite wisdom has committed the property interests of the country."

THOMAS E. WATSON
Copyright, 1904, Pach Bros., New York

Between these two extremes the People's Party takes its stand and makes its fight.

We cannot agree with the Socialist who demands everything for the labor of to-day and nothing for that of yesterday. That which is capital to-day was nothing more than labor yesterday. A blood-feud between parent and child is not more unnatural than a blood-feud between Labor and Capital; and the man who would confiscate the labor of yesterday cuts the ground from under the feet of those who really have at heart the best interests of the producer. On the other hand, those who pile up unwieldy fortunes by subtle manipulations of stock markets, dishonest reorganizations of railroads, corrupt acquisition of franchises, shameless arrangement of tariff schedules, and marauding assaults upon the national treasury are sapping the foundations of our Government, not only by making rottenness to eat like a cancer into the vitals of the body politic, but by creating that profound discontent among the masses upon which the Socialist thrives.

See the manner in which the Standard Oil band of speculators took $36,000,000 from their victims in one day on Amalgamated Copper; see the manner in which Morgan, Schwab and that crew profited on Steel stock to the large amount of $500,000,000; take the manner in which the telegraph, telephone, express and railroad companies plunder us every day in the year. Let me illustrate.

In the State of Georgia there is a railroad called the Central. Its original capitalization was less than $4,000,000. Then it was raised to $7,500,000. The Legislature of Georgia made quite a pet of the road, exempted it almost entirely from taxation and granted it generous privileges. For a generation or so the Central of Georgia was, perhaps, our best road. Everybody had confidence in it. Home folks kept their money invested in it. Executors, administrators and guardians thought themselves perfectly safe when they invested their funds in the old Central Railroad.

One day a band of robbers, elegantly

dressed—men of education and fine manners—rode down to Georgia from Wall Street in a Pullman palace car, secured control of a majority of the stock, and immediately clapped a bond issue of $16,000,000 on that road. These elegant, educated, palace car rascals pocketed the $16,000,000 and broke the back of the Central with the huge debt they had put upon it. The road went to public sale, and ten thousand men, women and children in Georgia were despoiled of property which they had been unable to keep out of the reach of those elegant thieves.

That $16,000,000 was created out of a dollar's worth of ink and paper. It represented nothing on earth but rascality, operating under forms of law.

But there is more of the story: J. Pierpont Morgan came upon the scene. "Last of all came Satan!" Morgan worked one of his reorganization schemes upon the bankrupt Central and watered the concern up to $50,000,000!

THOMAS H. TIBBLES
Candidate for Vice-President of the People's Party

And the people of Georgia and other States are being made *now* to pay dividends upon $50,000,000, when the *bona-fide* capitalization of the road was less than $8,000,000! Between them those two bands of robbers stole about $40,000,000 from the people of the South.

Who owns the Central Railroad at this time? No one seems to know. It either belongs to the Belmont L. & N. System or to the Morgan Southern System, or to both. As these systems are the allied corporations which have nullified our State Constitution by uniting competitive lines, and have put each their greedy hands into our pockets, it makes no material difference which of the two owns and controls the Central.

But here is an interesting fact which suggests much. Both Belmont and Morgan supported Parker's candidacy for the Democratic nomination.

When Parker first appeared in Georgia a year or so ago he was met by Hamilton McWhorter, who holds in the State of Georgia, and for the Southern Railroad System, the same position which State Senator "Pat" McCarren holds for the Standard Oil Company in New York. When "Pat" McCarren went actively to work for Parker was he obeying instructions from the Standard Oil gang? When Hamilton McWhorter met Parker and took him around Georgia in his private palace car was Hamilton obeying instructions from Morgan?

Belmont and Morgan are, for all practical purposes, partners. Their allied interests are colossal. They not only act for themselves, but for other kings of finance. The Rothschilds are among their connections. Now when both these partners were pushing the Parker campaign—which must have cost a huge sum of money—what was their object? What did they expect to get out of it?

It is now claimed by the New York *World* that Morgan has gone over to Roosevelt. If so, why didn't he carry the other partner along? Why leave Belmont behind? If one of these men, who plunder their neighbors under legal forms, supports Roosevelt while the other adheres to Parker, is it not about time for the American people to understand how both the old parties are kept in slavery to Wall Street? Is not that picture itself a sermon upon the necessity for a party which shall *not* be the willing servant of the corporations?

The people are not blind to these things; public morality is not all gone; the public conscience is not completely seared. To the very depths of their hearts the people feel the injustice under which they suffer and the trend toward a revolt is growing every day.

How have the millions of victims been kept under? How is it that they have borne the yoke so long? Because they have been kept divided and deluded. The corporations have learned the game of the kings: "Divide, in order to rule." Having split the people into two factions, one called Republican and the other Democrat, the corporations rule the land first through one of these parties and then through the other. A change now and then is made on purpose. It prevents the people from seeing "the hands" of those who play the game.

Thus Harrison in 1892 refused to make certain pledges which Wall Street interests demanded, and Wall Street threw its support and its millions to Cleveland, whose managers made the pledges.

By the by, the most striking thing about this campaign of 1904 is that every single one of the Cleveland managers of 1892 are Parker's managers now. The inevitable query arises: "Are pledges now being made for Parker similar to those which led to the scandals of Cleveland's second administration?

Are we to have another secret midnight bond deal? Are the greenbacks to be called in and destroyed, as Cleveland advised? Is the Standard Oil Company to have another feast at the banquet board of class legislation? Are we to have another member of a Democratic Cabinet writing a tariff schedule at the dictation of Havemeyer of the Sugar Trust?

In his address to the Democratic editors Parker not only indorsed and eulogized Cleveland's first administration, but his second also. That candidate for the Presidency who can deliberately give praise to the second administration of Grover Cleveland reveals his own utter lack of political morality and of sympathy for the masses of the people.

Why did Parker go out of his way to indorse that second administration, befouled as it was by infamies like those mentioned? Is he preparing the Democratic mind for a repetition of that redemption of campaign pledges at the expense of the taxpayers?

The People's Party combats Roosevelt, the open enemy who boldly proclaims and fights for those worst features of privilege and class legislation which we abhor. They are undemocratic, they are Hamiltonian, they tend to the rule of the favored few and the enrichment of the favored, non-producing few. We will fight him to the bitter end, but it is possible to respect a manly foe, who is worthy of your steel, and who will give you a free field and a fair fight.

The People's Party combats Parker because he seeks to obtain under false pretenses goods that belong of right to *us*. We do not object to his getting Republican votes if he can. What we do protest against is his effort to get Democratic votes when he is no Democrat. If he stands for anything except a chronic ache for office, that fact has failed to appear. He has had three "tries" at it and he has thus far beclouded and disguised whatever difference in principle there is between himself and his leading opponent.

It seems to me that it ought not to be so very hard for Parker, *if he is a true Democrat,* to tell the world in plain, simple, unequivocal English wherein he differs from Roosevelt *in principle.*

Why should voters support the People's Party in this campaign? Because it is the only party which makes an open, consistent, fearless contest for Jeffersonian Democracy. Every Bryan Democrat should be with us, because we are trying to do what the Bryan Democrats tried for eight years to do. Where else can they go?

Bryan Democrats ought not to vote for Parker. He voted with them in two campaigns and then left them, without saying they were wrong. Gold Democrats ought not to support him. He has gone over to them, but has not said that the gold standard is right. If I were a gold standard man I should want to vote for a candidate who not only declared that the gold standard was "*fixed,*" but that it was RIGHT.

Our platform speaks for itself. By indorsement and reaffirmance our former

platforms become a part of this. Its leading features are too well known to need elaboration here. The strength of our position is that we offer common-sense reform for each and every abuse of our present system. We do not attack the rich because they are rich; we *do* contend, however, that legislation should not be prostituted to the purpose of making one millionaire at the expense of ten thousand laborers. We *do* say that there is too much legalized robbery of the producer by the non-producer and that it must be stopped or there will be revolution.

Applying the principles of Jefferson to present-day conditions, we seek to restore the Government to old landmarks and to bring about what Jefferson and Lincoln meant when they spoke of a "Government of the people."

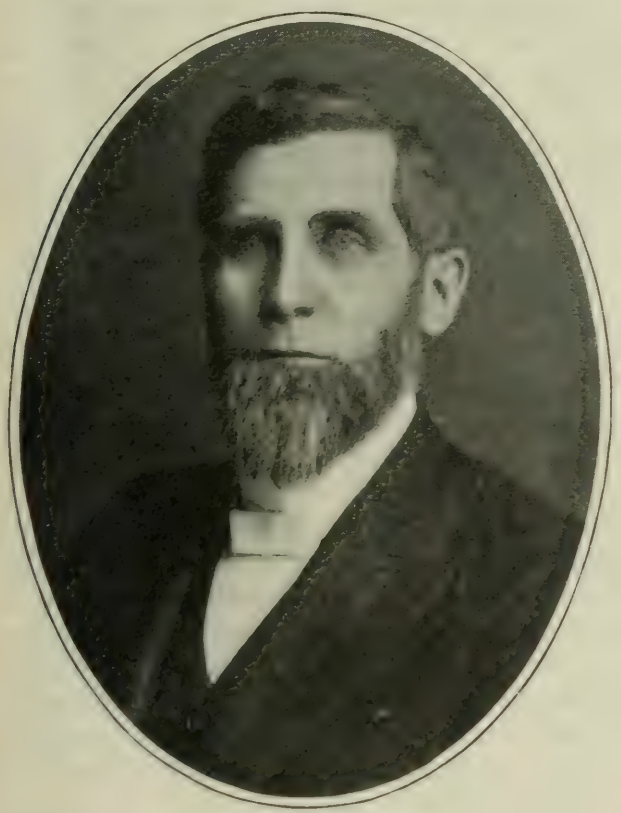
By placing public utilities in the hands of the Government; by restoring to the Government the sovereign right to create its own money; by putting the necessaries of life on the free list; by striking at overgrown fortunes with a graduated income tax; by making all office-holding elective, and retaining the right to turn out the officer who betrays his trust; by giving to the people the power to initiate and veto legislation; by making it a crime for capitalists to grind up little children into dividends; by using our utmost efforts to protect all men from the damnable doctrine that they are not born free, and to work out the problem to the solution that each citizen shall enjoy the God-given privilege of working for HIMSELF and enjoying what he *makes*—by putting its hands and its heart into tasks like these the People's Party believes that it will best serve the true interests of the vast majority of our people.

THOMSON, GA.

The Prohibition Party's Appeal

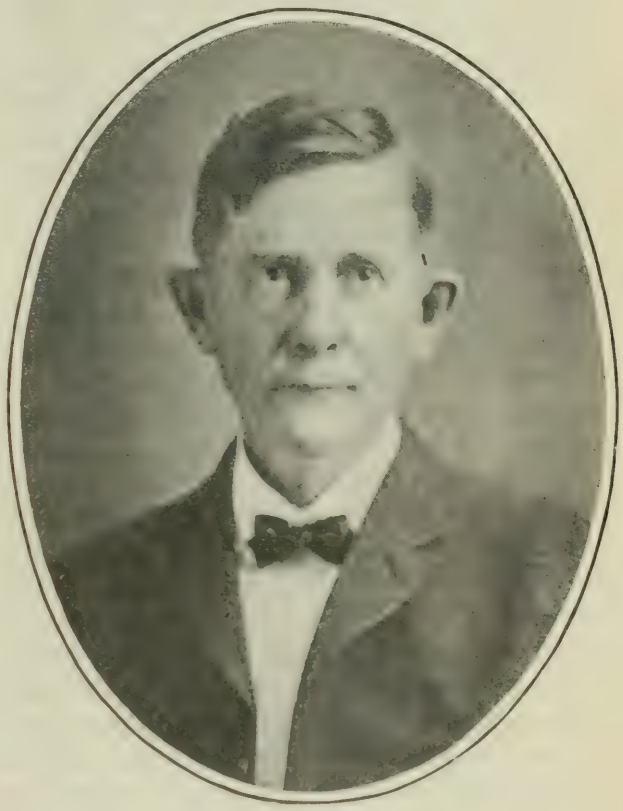
BY SILAS C. SWALLOW, D.D.

CANDIDATE OF THE PROHIBITION PARTY FOR PRESIDENT OF THE UNITED STATES



SOME time since THE INDEPENDENT kindly invited me to give to its readers from a radical Prohibitionist's standpoint some reasons for voting the Prohibition ticket. This request came to me a day or two after by nomination for the Presidency. The constant pressure of work, regular and extra, has prevented my complying with the request hitherto. I will endeavor to do so now. The reasons would fill volumes. I can give you but a few of them in a short letter, and they are these:

First. Because the liquor traffic by representing that the goods which it manufactures and sells are nourishing and healthful foods, when, in fact, they are slow poisons, has through this deception, and is now, sending annually a hundred thousand bodies to the grave, and, on the authority of the Bible, an equal number of souls to perdition.



Second. Gladstone declared that this traffic is the cause of more misery than war, pestilence and famine combined. It fills our prisons, almshouses and insane hospitals. It makes necessary a standing army of policemen and unnumbered courts, constables, jails, penitentiaries, asylums and almshouses, for which the people must pay, since the revenue received by Government from the traffic is only as 16 to 1 of the taxation it produces. It destroys the home, is the worst foe of the laborer, of the capitalist, of the traveling public, and is the prolific source of "evil, only evil, and that continually." It renders it hard for people to do right and easy for them to do wrong; while the purpose of government is to render it easy to do right and difficult to do wrong. The supply of liquor does not satisfy, but increases the demand in the individual, since the appetite for it

is not natural, but created by its use, and ever clamors for more of the poison till death ends the struggle.

Third. Because the general Government and most of our States and municipalities are in partnership with the liquor traffic, and by means of taxation receive annually a part of the price of blood and souls. Taxation always implies protection, and so long as this nefarious business is dignified and guarded by the strong arm of Government it cannot be pursued and destroyed by public opinion as would an unprotected nuisance. The general Government is a menace to the good order of those States that would protect themselves by preventing the shipment of this poison into their prohibitory communities, where it is disposed of in defiance of State and municipal laws. Hence the Hepburn-Dolliver bill pending before the last Congress looking toward the correction of this evil. Thus does the general Government constantly defy one of our cherished traditions—viz., that in a Republic the people constitute the Government. It is nevertheless true, and the only place at which they can legitimately and effectively express their will is at the ballot box. This they do at every election, the vast majority voting for one or the other of the two parties that "stand pat" for licensing rather than for prohibiting the evil. The existence of both of these parties under present conditions depends upon their favoring the liquor traffic, because the two hundred and fifty thousand liquor dealers of the country, by controlling an average of ten votes each, or an aggregate of two and a half millions, and acting under the unit rule, hold the balance of power. This vote knows no statecraft, politics, morals or religion, but only business, and the party that gets this vote is thus rendered for the time being the dominant party, and is permitted to feed from the public crib. To divide favors with these parties, and thus keep both in the field is the policy of the liquor traffic. The politics of the country is largely managed by professional politicians. It is their business. Their living depends upon it. They must succeed in getting votes enough to elect them, or change their business, or starve. The church vote of nearly five millions, if cast solid for Prohibition, would more

SILAS C. SWALLOW

GEORGE W. CARROLL,
Candidate for Vice-President of the Prohibition Party

than overbalance the liquor vote and compel the political parties to favor Prohibition or go out of business. They would do the latter. But the millionaire brewers and distillers, organized into a powerful trust, with almost unlimited resources, filched from the pockets largely of the wage earners of the country, manage to keep before the people, through the subsidized politicians, divisive issues, made to appear of more importance than the liquor traffic question, and thus the church vote is kept divided. One year it is a struggle over the "bloody shirt;" and the next over money, as to whether it should be hard or soft, yellow, white or green, plenty or scarce; another year it is the colonial system or the Monroe Doctrine, or imperialism, or benevolent assimilation: shall it be done benevolently or at the point of the bayonet? The tariff is the ubiquitous bone over which the political dogs perpetually fight, and with which they fool the unthinking masses into taking sides, as tho it were a political question, when, in fact, it is a purely business proposition. The two parties have changed places on most of these subjects, in some cases two or three times. Cleveland was for reciprocal tariff, McKinley was for an arbitrarily high, exclusive tariff; but his last speech ever delivered was for a reciprocal tariff. If memory serves me properly, the difference of revenue between the tariff proposed by the Republicans and that proposed by the Democrats, in one of the most hotly contested political campaigns, was only the matter of about fifty millions.

Fourth. Hence voters should come to us, because we have the really and only dominant issue. The legalized traffic in the soul, body and substance destroying poisor amounted last year to more than fourteen hundred millions of dollars ($1,400,000,000). This money, so far as the health, happiness and prosperity of those who spent it goes, might better have been piled up in one vast heap and burned; for it purchased neither food, raiment nor shelter, but only that which was hurtful to all the interests of the purchasers and of society at large.

Fifth. Because there is no hope of either the Republican or the Democratic party adopting the Prohibition issue. They have frequently been petitioned to do so, but as often refused. The list of names, nearly a mile long, carried to a Republican National Convention years ago by that queenly woman, Frances E. Willard, and her heroic helpers, was found after the convention adjourned under the table, where the representatives of "the party of moral ideas" had mutilated it with tobacco juice and with the marks of their cloven feet. Dr. Sheldon, of Kansas, but of worldwide fame, sent a long list of the names of representative Americans, attached to a petition, to President Roosevelt, only last winter, asking him to recommend in his message to Congress some solution of the liquor traffic problem, or at least some mitigation of the awful curse for which the Government stands sponsor. But, tho the President's Message was an exceedingly lengthy one, not one line was devoted to even the economic aspects of the case.

The old parties were each organized around great central truths. They accomplished the object of their creation, and thence straightway, as "Satan finds some mischief still for idle hands to do," began to gamble for the loaves and fishes; or, to change the figure, began to cast lots for Truth's seamless garment. Their managers no longer go even so far as did Pilate eighteen hundred years ago, asking, "What is truth?" But they lie awake nights to invent issues around which to beat their tomtoms for the confusion of the voters.

Sixth. It is sometimes asked, "Why not imitate the liquor dealers, and throw the solid church vote for one party or the other, and thus bring one of them to the adoption of your issue?" We answer, because parties, like individuals, are largely the creatures of heredity and environment, and both parties are thus hopelessly doomed through the force of affinity to "pitch their tents in the graveyard of dead issues," and spend their time "garnishing the sepulchres of the dead." These parties are mortgaged for all time to the liquor interest, and as sure as seed is a prophecy of harvest, will they continue to "bring forth after their kind." The liquor trust of the country is one of the mightiest monopolies on earth. Having subsidized the two old

parties, these parties have largely, in turn, subsidized the church by giving to church members a fair share of political offices, elective and appointive. And now comes the strangest part of all, for it is certainly a spectacle that must make "angels weep" and "devils laugh" to see these politico-ecclesiastics vote as they do in the great church assemblies for resolutions declaring that "no political party ought to receive the support of Christian men so long as it fails to put itself on record in an attitude of open hostility to the saloon," and then mount their several party platforms, neither of which have a word of condemnation of the saloon, and carry on their fierce campaign till the election closes in the ides of November without once opening their lips with any personal declaration against that same liquor business which they have so eloquently condemned in the church gathering.

If either party should espouse our issue, nominal Prohibitionists from the other party are not likely to come into their ranks, because of old party antipathies. But there is some hope that from each side there are those who will leave the old, and, coming half way, meet each other in a new organization where past party asperities will be lost sight of in the earnest desire to save our country from this present "sum of all villainies."

Seventh. Because Prohibition, with a party behind it, is the only kind that will prohibit. Hence Portland, Maine, after having for a long time a prohibitory law which was secured by a vote of the people, but which was not enforced because what was everybody's business was nobody's business, was compelled to elect Pearson, a third party representative, as sheriff of the county, and then Prohibition prohibited. It is on the same principle that an ax won't chop and a scythe won't mow without human hands to wield the one and swing the other.

Many other reasons might be given, but we forbear. There will probably in the coming election be a great many Christian people who will just this once more find it necessary to save the country by voting in opposition to their own prayers. They claim to vote as they pray, and perhaps they do—that is, pray with their eyes shut and vote that way, too. They will say, "I would vote the Prohibition ticket, but can't bear to lose my vote." The value they attach to their own pious aspirations is thus manifest in the fact that they don't object to losing their prayers. But once more nearly one-half of the fourteen millions (14,000,000) of voters in this country will lose their votes in the sense of not electing their candidate, but they will not lament greatly over the loss, for the reason probably that their estimate of his value as the representative of a whisky party was not a very high one. No vote is lost that represents conscientious convictions.

HARRISBURG, PA.

The Social Democratic Party's Appeal

BY EUGENE V. DEBS

CANDIDATE OF THE SOCIAL DEMOCRATIC PARTY FOR PRESIDENT OF THE UNITED STATES

THE Socialist party is the only international political party in the world. It has about 8,000,000 supporters, and is, therefore, in point of numbers, the greatest political organization on earth. Its fundamental principles are essentially the same in all lands, for modern socialism is the product of industrial evolution and is coextensive with the working class.

A socialist is a socialist irrespective of nationality, color, creed or sex. Where modern industry makes its way—and all barriers are going down before its triumphant march—socialism follows in its wake and raises the standard of international, working-class solidarity and economic freedom.

The socialist recognizes no national boundary lines. The nation in which he lives embraces the working class of the world. Every worker everywhere is his brother.

Across the borders of all lands so-

EUGENE V. DEBS

cialists clasp hands as comrades, and their conquering movement girdles the planet.

There are many who look upon socialism as Utopian, illusory, impossible. They affect to regard it as a "reform" spasm that will soon subside. They are quite certain it will follow greenbackism and populism to the political potter's field.

There are others, like President Parry, of the Manufacturers' Association, for instance, who make one of socialism and anarchism, and declare it an imported plague, a menace to be dreaded, and insist that patriotic citizens should unite to stamp it out of the nation.

Strange that some of these gentlemen should consider socialism so harmless and others so destructive—so impossible and yet so much to be feared—so visionary and yet so terrible.

All of which simply proves—assuming these gentlemen to be entirely honest—that of all subjects that engage attention in the world of thought, socialism can claim the palm for attracting a larger volume and variety of intelligent ignorance and educated stupidity than all others combined.

The man who says that socialism and anarchy are analogous makes a pathetic exhibition of his ignorance—to treat him gently—and is hardly excusable in this day of cheap and abundant literature.

Anarchy is individualism, the negation of government. Socialism is collectivism, the perfection of government. Anarchy regards every human being as a law unto himself, to do as he pleases without hindrance on the part of his fellows. Socialism looks upon society as an organism of which all are integral parts to be adapted and co-ordinated upon a basis of harmonious co-operation, not for "the greatest good of the greatest number," but for the greatest good of all.

Anarchy scorns the ballot and repudiates all politics as essentially corrupt and demoralizing. Socialism appeals to the ballot to express the untrammelled will of the people as the supreme law of society.

It is quite easy to discover the points of analogy between anarchism and the present system. It would be quite hard to tell them apart just now in Colorado. "To hell with the Constitution," the capitalist slogan in the Rocky Mountains, is echoed with enthusiasm by every anarchist in Christendom.

The Socialist party is the only party that honestly stands for law and order. There can be neither until we have economic justice, and this is impossible in a system based upon exploitation.

The scenes now being enacted in Colorado, which in all likelihood will spread to other industrial centers, bear irrefutable testimony to the inherent contradictions in modern society, the outgrowth of our democratic tendencies in politics in conflict with our autocratic tendencies in industry.

"A house divided against itself cannot stand."

Political democracy and industrial despotism will not abide together. One or the other must go before we can have peace.

Industrial democracy or political absolutism? Which?

Socialism has given its answer; it is the answer of industrial progress and social evolution.

And with these forces socialism has

marched hand in hand from Utopia to science.

Socialism is the next inevitable phase in the evolution of civilization.

It is not "such stuff as dreams are made of," but a social system that is to be, evolving, according to scientific analysis, from the one that is, and built upon a granite foundation of demonstrated economic facts.

It may be retarded, checked, delayed, but its coming cannot be prevented unless the evolutionary forces underlying society can be arrested and humanity itself paralyzed.

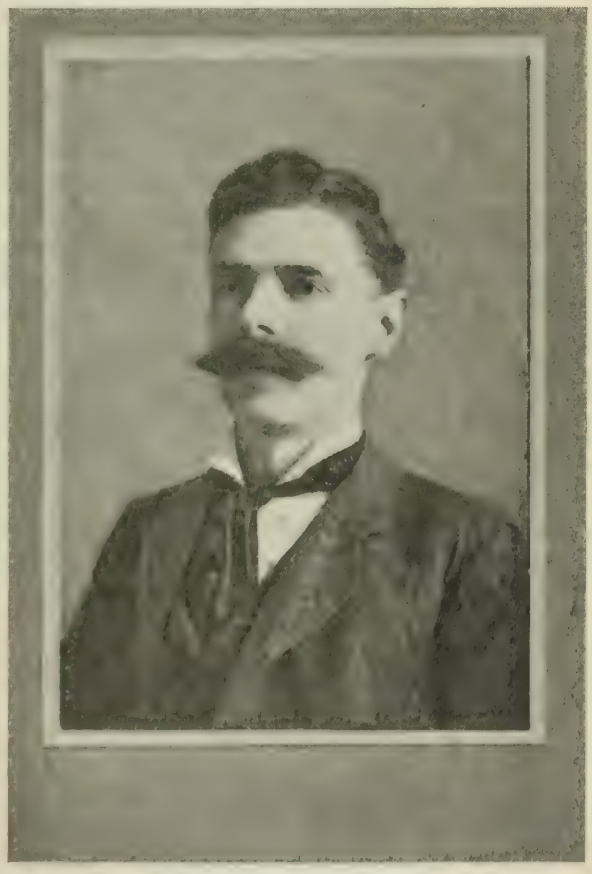
Herbert Spencer, the arch-individualist, was opposed to socialism, but was candid enough to admit that it was inevitable.

What of this world movement in the United States of America?

The interrogatory is timely, since we are moving toward a national election, in which socialism may be a factor of sufficient importance to determine the result.

In the Presidential election of 1892 the socialists polled 21,164 votes. In 1896 the vote was increased to 36,274. Four years ago, in 1900, socialists polled a combined vote of 127,553. Two years later, in 1902, the vote was almost doubled, 240,795 votes being cast. This steady increase occurred during the period of the nation's greatest "prosperity," and while the boast was made that "two jobs were looking for every man" in the United States.

The industrial tide, having reached its highest point, is now receding and the period of depression, corollary to the period of activity, is setting in, and many thousands of workingmen are being discharged outright, or reduced to half or less than half time.



In vain will the professional politician appeal to the "full dinner pail" in addressing himself to the army of idle men who will have time to listen to him this year, and in vain will he exhort their appetities to "stand pat" upon the memory of that once inspiring issue.

Four years ago the conditions were as unfavorable for socialist propaganda as they well could be. The party was poorly organized in but half a dozen States. It was a national party in name only. The campaign was carried on without resources. Labor, as a rule, was employed and therefore contented. The socialist had everybody and everything against him.

This year all the conditions are as favorable as they were unfavorable four years ago. The Socialist party is organized in almost every State and Territory in the Union.

The late national convention, notwithstanding the silence of the Associated Press, was a revelation to every one who saw it. Such a body of men and women, students of labor problems, masters of economics, evolved from the working class itself, never met before in the United States in the interest of that class. There were scores of them, in their working clothes, who would put to shame any equal number of Senators or Congressmen in any discussion upon the labor question, or upon any political issue involved in the struggle between labor and capital.

The following is an extract from the national platform adopted by the convention:

BENJAMIN HANFORD,
Candidate for Vice President of the Social Democratic Party

"As an American socialist party, we pledge our fidelity to the principles of international socialism as embodied in the united thought and action of the socialists of all nations. In the industrial development already accomplished the interests of the world's workers are separated by no national boundaries. The condition of the most exploited and oppressed workers, in the most remote places of the earth, inevitably tends to drag down all the workers of the world to the same level. The tendency of the competitive wage system is to make labor's lowest condition the measure or rule of its universal condition. Industry and finance are no longer national but international in both organization and results. The chief significance of national boundaries, and of the so-called patriotisms which the ruling class of each nation is seeking to revive, is the power which these give to capitalism to keep the workers of the world from uniting, and to throw them against each other in the struggles of contending capitalist interests for the control of the yet unexploited markets of the world, or the remaining sources of profit.

"The socialist movement, therefore, is a world movement. It knows of no conflicts of interests between the workers of one nation and the workers of another. It stands for the freedom of the workers of all nations, and, in so standing, it makes for the full freedom of all humanity."

. . . . . .

"The socialist program is not a theory imposed upon society for its acceptance or rejection. It is but the interpretation of what is, sooner or later, inevitable. Capitalism is already struggling to its destruction. It is no longer competent to organize or administer the work of the world, or even to preserve itself. The captains of industry are appalled at their own inability to control or direct the rapidly socializing forces of industry. The so-called trust is but a sign and form of the developing socialization of the world's work. The universal increase of the uncertainty of employment, the universal capitalist determination to break down the unity of labor in the trades unions, the widespread apprehensions of impending change, reveal that the institutions of capitalist society are passing under the power of inhering forces that will soon destroy them.

"Into the midst of the strain and crisis of civilization the socialist movement comes as the only conservative force. If the world is to be saved from chaos, from universal disorder and misery, it must be by the union of the workers of all nations in the socialist movement. The socialist party comes with the only proposition or program for intelligently and deliberately organizing the nation for the common good of all its citizens. It is the first time that the mind of man has ever been directed toward the conscious organization of society.

"Socialism means that all those things upon which the people in common depend shall by the people in common be owned and administered. It means that the tools of employment shall belong to their creators and users; that all production shall be for the direct use of the producers; that the making of goods for profit shall come to an end; that we shall all be workers together, and that all opportunities shall be open and equal to all men."

For the first time the socialists enter a national campaign with a national party—a party that is united, aggressive and enthusiastic from sea to sea.

The industrial conditions and tendencies are all well calculated to set the working class thinking and to open their eyes to the trend of events.

In the presence of the abundance their labor has created they are idle and helpless, their wives fret and worry and their children, instead of a joy, become a burden to them.

The more industrious they are, the more they produce, the worse they are off, for the sooner does overproduction close down the mill and torture with hunger pangs the too industrious workingmen.

Something wrong! Something wrong!

That is the beginning in the mind of the intelligent worker and it never lets go until he is a socialist, and once he sees the light and becomes conscious of the latent economic power of his class he is a socialist through good and evil report to the last day of his life.

The campaign of the Socialist party is and will be wholly educational. To arouse the consciousness of the workers to their economic interests as a class, to develop their capacity for clear thinking, to achieve their solidarity industrially and politically is to invest the working class with the inherent power it possesses to abolish the wage-system and free itself from every form of servitude, and this is the mighty mission of the socialist movement.

Not a dollar for whisky, or cigars, or carriages! Not a dollar for a vote if a single dollar could buy every office in the land!

Can the Republican party or the Democratic party truthfully say as much?

The campaign fund, such as it is, is

used wholly to print and circulate literature, defray the traveling expenses of speakers and other educational purposes, and this fund is raised, not by "frying the fat" out of law-defying corporations, nor by extorting boodle from the corrupters of legislation and the beneficiaries of debauched public morals, but by each member contributing the equivalent of a half day's work from his wages.

We can challenge the record of political integrity and party cleanness without fear of accusation. We shall not compromise, nor shall we be deflected in the least by any consideration from the straight road to the co-operative commonwealth.

The Socialist party is the only party that does not want a vote that is not intelligently cast. The popularity of a candidate is against him rather than for him in the Socialist party. No vote is wanted on account of the personality of a candidate. It is the value of the socialist principle that is taught and emphasized, and if this is not understood and approved the vote is not wanted.

Mere disgust with other parties is not accepted by socialists as sufficient reason to encourage the voting of the socialist ticket. Such votes are unreliable, deceptive and misleading. The men who cast them are apt to desert at the very time they are most needed Any vote that is subject to the influence of personal considerations is so vacillating that it is of no use in the constructive work of a revolutionary political movement.

Better a thousand trained, tried and true men, united on the solid basis of principle, than ten times that number thrown together on the shifting sands of personality.

In the Republican and Democratic national conventions principle is subordinated to personality. *"Who are the candidates?"* is the all-absorbing question. The people, like helpless children, are forever looking for some "great man" to watch over and protect them.

In the socialist convention principles are paramount; the candidates are the last and least consideration. The supreme question is, "What are the Principles?" and all the ability and interest of the delegates are absorbed in producing a scientific platform.

Socialists are not on the alert for some mythical Moses to lead them into a fabled promised land, nor do they expect any so-called "great man" to sacrifice himself upon the altar of the country for their salvation. They have made up their minds to be their own leaders and to save themselves. They know that persons have deceived them and will again, so they put their trust in principles, knowing that these will not betray them.

Between the Republican party and the Democratic party there is no difference so far as the workingman is concerned. He works for wages, and, as a rule, it costs him all he gets to live. If he organizes and forces up wages his exploiters raise prices. He has not the least interest in the tariff, or finance, or expansion, or imperialism. These issues concern the large capitalists represented by the Republican party and the small capitalists represented by the Democratic party, but they appeal to no intelligent wage-worker, and the fact that workingmen divide upon these capitalistic issues accounts for their being driven out of Colorado and Idaho, and for their being the victims of wage-slavery everywhere.

The Socialist party addresses itself to the working class, seeking to develop the intelligence of that class, while it appeals to the ballot for the realization of its co-operative commonwealth.

Others than workers are welcome on condition that they recognize the class struggle and join the party on the basis of a working class party.

Why should workingmen support the Socialist party?

Because it is the only party that is unequivocally committed to their economic interests, to the abolition of the wage-system and the freedom of the worker from exploitation and every other species of servitude.

The Socialist party does not expect the support of the capitalist class, for it is opposed to their economic interests, and it would be foolish to expect them to abolish themselves.

Let no one charge that socialists have arrayed class against class in this struggle. That has been done long since in the evolution of capitalist society. One class now owns the tools while another class uses them. One class is small and

rich and the other large and poor. One wants more profit and the other more wages. One consists of capitalists and the other of workers. These two classes are at war. Every day of truce is at the expense of labor. There can be no peace and good will between these two essentially antagonistic economic classes. Nor can this class conflict be covered up or smoothed over. In Colorado, at this very moment, it is raging in full fury, and thousands of workingmen all over the United States are reading their own impending doom as wage-workers in the murderous volleys of capitalist misrule that belch from the rifles of the mine owners' militia as they assault a union hall and shoot down in their tracks their fellow workingmen for no other crime than that they belong to a union that is engaged in a strike to enforce an eight-hour law voted as a constitutional amendment by a majority of more than 46,000 of the people, and then denied the people by a corrupt legislature bought bodily and brazenly by the mine owners to betray the people they were sworn to serve.

The workers are not all blind to the causes underlying this great struggle. They are beginning to see and to think, and this fall many thousands of them will begin to act.

They know that under Republican rule and Democratic rule conditions for them have remained unchanged. They know that under the administration of both the "panic" comes, that enforced idleness is certain, that strikes, boycotts, lockouts, injunctions, riots and bloodshed are inevitable, and that many of their number are doomed to drift into poverty and crime and finally end their lives as beggars, suicides, in prison cells or on the scaffold.

They know, too, that under both Democratic and Republican rule the President is on the side of the capitalists, that the Governors are all on the side of the capitalists, that Congress and all the State legislatures respond to the demands of the capitalists, that the courts are uniformly with the capitalists, while soldiers and injunctions and "bull-pens" are for the exclusive benefit of workingmen.

The class struggle accounts for it all, and the intelligent worker takes his place on the right side of this struggle and works with all his might to bring his benighted brethren to the same side.

The Socialist party is the party of the workers, who are on the right side of this world-wide struggle, and, altho a minority to-day, it contains all the elements of self-development and will expand to majority proportions to inaugurate the impending change as certain as the forces of industrial evolution are undermining the present system and making that change inevitable.

The Socialist party is the party of the present and of the immediate future. It believes that the competitive system has outlived its usefulness, that it has become an obstruction in the path of progress, that, like feudalism, from which it sprang, it must pass away to make room for its co-operative successor.

The Socialist party stands for the abolition of the wage system, for the economic freedom as well as the political equality of the working class, knowing that without the former the latter is impossible.

The Socialist party stands for the collective ownership of the means of wealth production and distribution and the operation of industry in the interest of all.

The Socialist party stands for industry of the people, by the people and for the people, that wealth may be produced for the use of all instead of for the profit of a few, and as the basis of a real republic, in which every citizen shall have the inalienable right to work and to enjoy all the fruit of his labor.

The Socialist party stands for a social order, in which every human being, in the full enjoyment of economic freedom, shall have full opportunity, in the best possible environment, to develop the best there is in him for his own good as well as the good of society at large.

When the Socialist party succeeds to power, as it will as certain as the tides ebb and flow, it will inaugurate these changes and usher in the Socialist Republic.

Upon these issues the Socialist party makes its appeal to the American people.

The Socialist Labor Party's Appeal

BY CHARLES HUNTER CORREGAN

CANDIDATE OF THE SOCIALIST LABOR PARTY FOR PRESIDENT OF THE UNITED STATES

ALL class interests eventually find their expression in a political party; otherwise those interests will never be conserved. As Franklin observes in his autobiography: "All the great affairs of the world, its changes and its revolutions, have been brought about by political parties." The Socialist Labor Party came into existence as the exponent and representative of the interests of a class—the working class. The workingmen within its ranks are not visionaries, seeking to try new schemes of government; they seek control of the political powers in order to administer the affairs of the Government in the interest of their class; just as the farmers go into politics for the benefit of their class; just as the capitalists are in politics to run the Government in their interests.

CHARLES HUNTER CORREGAN

With the increasing number of strikes and lockouts in the industrial world, it should be plain to even the blindest that there are opposing interests in society, that there are two forces struggling for mastery. This struggle and the attempt to reconcile these interests form what is called the Labor Problem. Political economists, philanthropists, statesmen and politicians are giving their attention to the solution of this problem; but, notwithstanding all attempts to bring peace to these warring interests by arbitration and mediation, through Civic Federations, Industrial and Strike Commissions, the number and bitterness of the conflicts grow ever greater, the field of battle grows ever larger, and ever more disastrous becomes the effect upon society. The problem has to-day become a Social Problem, and we find the Government stepping in and taking a hand in what was once considered a matter to be settled by the combatants involved.

All those who have attempted to solve the Labor Problem have assumed that the forces at war are reconcilable, that the interests of the workers and their employers were identical, that they were mutually dependent upon each other, that "safe relations" could be established between them, that greed or ignorance or obstinacy was at the bottom of the difficulty, and that their differences could be adjusted if the Golden Rule were followed or they would listen to reason. The Socialist Labor Party alone has contended that the interests of the capitalists and of the workers are unalterably opposed to each other, that the conflict between them can end only in the complete subjection of the workers, or the complete overthrow of the capitalists. The workers are interested in securing as high a wage as possible, in shortening the hours of labor, in improving the con-

ditions under which they toil. They cannot secure these things without cutting into and reducing the profits of the capitalists. Every increase of wage, every reduction in the hours of labor means a corresponding decrease in the income of the employers and will be vigorously contested by them. On the other hand, the employers are interested in increasing their profits, and this is possible only by prolonging the hours of work of the workers, by decreasing their wages, by intensifying their labor, or by introducing a cheaper labor, and that will be bitterly opposed by the workers. Each day, however, the power of resistance of the workers grows less, and their organizations, tho numerically stronger, become economically weaker, and at best present the appearance of the rear guard of a retreating army whose utter rout is prevented by a show of strength. This is due to the fact that the skill and brawn of the workers, their power to produce wealth, which is the only thing they have to sell, the only thing by the sale of which they can procure food and clothing and shelter, is a merchandise, and the price of labor, called wages, is governed by the same law of the market as the price of cotton, of wheat, or other commodities. Supply and demand will regulate the wages of labor as accurately as they will regulate the price of other merchandise, and the supply of labor is increasing while the demand for labor is decreasing.

WILLIAM W. COX
Candidate for Vice-President of the Socialist Labor Party

Labor-saving machinery, which not only displaces thousands of workers, but permits the entrance of women and children into active competition with the male workers; economy of production due to concentration of industry and production on a larger scale, have filled the labor market in every line of employment to overflowing. And this development of the process of production will go on, and new machinery will continue to render more workers superfluous. As it has been well said, the capitalist is a general who grows more powerful as his army decreases. The fewer workers a capitalist needs to produce a given amount of wealth, the stronger he becomes; the cheaper he can sell, the easier he can drive his competitors out of business; the larger the reserve army of workers becomes, the better his chance to keep down the price of labor. For the only thing that produces values is labor, the only thing paid for is the amount of socially-necessary labor embodied in an article. The capitalist system recognizes the contention of the socialist—let the capitalists ignore it as they will—that labor alone produces wealth.

Not only a decreasing part of the wealth which he produces will become the portion of the worker, but periodically will come those economic paroxysms, which all classes fear, but which none can prevent because they are inherent in the system—the industrial crises. The very abundance of wealth produced—over-production—becomes a blight and brings privation and starvation—under-consumption—especially to the class that produces that abundance. Having received as wages only a small fraction of the values they produced, the workers can buy back only that small fraction

When the remainder piles up in the hands of the capitalists; when, scour the world as they will, they can find no market for the goods produced; when the storehouses and warehouses are filled with merchandise for which there are no purchasers, they will stop production, the factories will be closed, the wheels of industry will be silent, and the workers will be turned into the streets unemployed to suffer and starve in the midst of the abundance they have produced.

The maintenance of the capitalist system of production means for the workers an ever decreasing portion of the wealth they produce, an ever deeper misery, an ever increasing subjection. Republicans and Democrats and all other political parties, no matter what names they sail under, stand for that system and all it implies. Under it the wealth will concentrate in ever fewer hands, and increasing numbers of the workers will be divorced from the opportunity of production. Having no means of self-employment, they will be deprived of the right to work. No matter what their skill, no matter what their willingness, no matter how much they may suffer, they must find a master to employ them, or stand still and starve. The maintenance of this system means the ever more intense exploitation of the workers, and it means ever more starvation in idleness. And these effects cannot be abolished without abolishing the system itself. To secure to the workers free access to the means of production and the bounties of nature and the full product of their labor, private ownership in the land on and the tools with which wealth is produced must cease: the people as a collective body must assume the function of production. To bring this change about is the task of the workers themselves. All other classes strive to keep possession of the means of production that they may perpetuate their right to exploit the workers, and to this end seek to secure the political powers by which alone private property is maintained. For this purpose the working class must be duped and blinded as to their true interest; false issues must be presented, false promises given, false hopes raised; for politically the working class is invincible, their votes maintain the system under which they are plundered, their votes alone can uproot it.

The Socialist Labor Party, the sole political exponent of the aims and aspirations of the intelligent, class-conscious workers, squarely faces the real issue in this campaign, and will not permit that issue to be obscured and ignored. To Capitalism it opposes Socialism. In place of a system that means the exploitation and abject dependence of the workers upon their exploiters, it presents a system of production which means economic freedom and the full fruits of their toil to those who produce. For a system in which the workers suffer privation and starvation, while the non-producers revel in abundance, it offers a system which means plenty for the producers and can mean starvation only for the idlers.

This issue, as in the past, it presents to the working class for their support at the ballot box, and it calls upon all willing to do their part toward hastening the overthrow of capitalism to aid the only political movement that can wipe out all forms of industrial slavery, can abolish the plunder of the workers, and can establish a social system based upon perfect economic and political freedom.

This, as its platform declares, can be accomplished "by placing the land and all the means of production, transportation and distribution into the hands of the people as a collective body, and substituting the Co-operative Commonwealth for the present state of planless production, industrial war and social disorder—a commonwealth in which every worker shall have the free exercise and full benefit of his faculties, multiplied by all the modern factors of civilization."

NEW YORK CITY.

The National Liberty Party's Appeal

BY GEORGE EDWIN TAYLOR

CANDIDATE OF THE NATIONAL LIBERTY PARTY FOR PRESIDENT OF THE UNITED STATES

THE National Liberty Party now confronts the people of the United States claiming their consideration for the first time; but tho the organization is in its infancy, the principles for which it stands are fundamental to our republican form of government. In fact, we are struggling to revive the well nigh deserted principles of the grand old Whig party (the mother of the Republican party), which declared for "popular rights," government of all the people, for all the people, and by all the people.

When the founders of this Republic were called upon to frame the Declaration of Independence and a Constitution for the future guidance, protection and foundation rock of the Government, through their inspired wisdom they drafted ordinances declaring their independence, and guaranteeing protection, equal privileges, equal opportunity and equal rights to all citizens of the Government. It was at that time clear to them that upon no other premises could the American people hope to secure their freedom and independence, and maintain a popular Government. And the history of the past one hundred and twenty-seven years proves the correctness of their judgment, that to depart from these fundamental principles is to endanger the very perpetuity of our Government.

The National Liberty Party calls the attention of the people of the United States to the fact that these fundamental principles are fast being covered up, ignored, disregarded and practically nullified by the administrative powers, the national governing forces of both the Republican and Democratic parties, and the controlling political forces of at least six States of the Union, which have recently by State constitutional amendment, actually disfranchised over 2,000,000 American born citizens.

Practically all of these disfranchised people are negroes, and it is also a fact that, under the Federal Constitution and Laws, we are as emphatically recognized as citizens as are the most aristocratic Caucasians. If not, why not?

The history of the National Liberty Party is very brief. It is the direct outgrowth of the Civil and Personal Liberty Leagues, which for years have thrived among the negroes of the South and portions of the East. Through the efforts of Stanley P. Mitchell (the head of the Liberty Leagues), of Memphis, Tenn., and his associates, the first National Convention of the National Liberty Party was held in the Auditorium of the Douglas Hotel, in the City of St. Louis, on the 5th and 6th of July last, when a permanent and complete organization of the party was effected. Thirty-six States were represented in the convention.

We religiously adhere to the sacredness of our form of Government and subscribe to its every tenet, law and claim. We believe that the tendency of the dominant parties is to dissipate these tenets, laws and demands, and that it is our duty and the duty of every sober-minded citizen to join us in the arrest of this wholesale dissipation, in the interests of good government, the maintenance of Federal power, and perpetuity of our system of Government, which the popular sentiment of the world pronounces the most beneficent the world has ever known.

It must be clear to all unprejudiced students of history that whenever a Government fails to secure for all its subjects or citizens at home, as well as abroad that which it guarantees, that such Government is nearing dangerous ground—it matters not whether said neglected citizens belong to or represent a popular or unpopular class. For, in such neglect, a fundamental principle of government is abused, distorted, abandoned, and, like a cancer, it will continue to grow and spread until finally it gnaws in twain the very vital cords. The negro who now suffers most directly, by reason of this

neglect (disfranchisement), is not, in fact, the only sufferer, for his immediate calamity is the beginning of the end of the downfall of the producing element of the races who comprise the vast common working classes of this great Republic. The negro of the United States is distinctively an important factor in the great and grand army of American workingmen, and whatever enhances, strengthens, retards or impedes his progress, happiness, manhood, or citizenship rights, proportionately affects all the citizens of his class and standing. Hence, the interest that all common people of every race or nationality in the United States should have in this Government. Does the question, "Am I my black brother's keeper?" arise in the minds of the common (white) people? If so, I refer to the history of the world from the days of Cain and Abel for your answer. Judas betrayed the Christ only to earn for himself eternal reproach and an ignominous death; Napoleon, through intrigue, captured and starved to the death in a dungeon that gallant statesman and warrior, Toussaint L'Ouverture, and, as a reward, died the death of an exile; the Spaniards, through deception and cunning, assassinated General Maceo, the greatest negro soldier and general of modern times, and soon afterward were subjected to banishment and disgraceful defeat as their reward. In short, the history of the world proves the ultimate defeat of wrong and the establishment of right.

It is the purpose of the National Liberty Party to point out some of the dangerous errors in our present system of government, and work for their correction, and we shall not cease until this end shall have been accomplished, for it appears to us to be patriotically obligatory.

As to the independence of the National Liberty Party, I do not hesitate to state that in every sense of the word we are, and propose to remain, purely independent, for the principles for which we stand are not now germane to the platform of principles of any other political party. If they were, there would be no room or occasion for the existence of this party. The National Liberty Party is purely a creature of necessity.

Never before in the history of American negro citizenship has the time been so opportune for an independent political movement on the part of the race. And never before has there been a time when such a movement could draw materially from the race. But now, in the light of the history of the past four years, with a Republican President in the executive chair, and both branches of Congress and a majority of the Supreme Court of the same political faith, when we are confronted with the amazing fact that more than one-fifth of the race are actually disfranchised, robbed of all the rights, powers and benefits of true citizenship, we are forced to lay aside our prejudices, indeed, our personal wishes, and consult the higher demands of our manhood, the true interests of the country and our posterity, and act while we yet live, ere the time when it shall be too late. No other race of our strength would have quietly submitted to what we have during the past four years without rebellion, a revolution, an uprising.

We, too, propose a rebellion, a revolution, an uprising, but not by physical force, but by the ballot,—through the promulgation of the National Liberty Party. Our education, our civilization, and our natural disposition, all incline us to this course as the only rational, consistent, effective method of attaining the desired end—viz.: representation as well as taxation,—the full exercise of our Constitutional rights as citizens. The only truly effective way for the common people to correct a national evil lies in their power at the ballot box, if they will but exercise it judiciously.

Whenever the race and their co-laborers shall array themselves in one grand independent political phalanx, the very foundations of the two dominant political parties will be shaken, and the leaders of both will be brought to a realization of the danger which threatents their organization, and "*the rights of the people*" will again be considered by them instead of those of special classes, as is the present rule.

It is the intention of the committee of the National Liberty Party to perfect all necessary arrangements to have placed upon the ballots of the several States, Presidential electors, and in many instances to nominate, by petition or otherwise, Congressional candidates. Should

we fail to complete the organization in all the States this year, we shall continue the work after the election. Our greatest strength, of course, lies in the Southern States which have not as yet adopted disfranchisement amendments. We expect to make a good showing in Kansas, Indiana, Illinois, Ohio, Pennsylvania, West Virginia, Tennessee, Iowa, Texas and many other States. It is conservative to estimate that at least sixty per cent. of the negroes of the States in which we secure a place upon the ballot for our candidates, will vote with us. It is also fair to presume that a goodly number of the white independents in these States will support the movement. Why not? We stand for the text and the spirit of the Declaration of Independence, and the Federal Constitution; for universal suffrage; for the pensioning of all veterans of the War of the Rebellion; for the establishment of a National Arbitration Board, with power to adjust all differences that may arise between employer and employee; for the abolition of polygamy; for the nullification and repeal of all class legislation; for unsubsidized competition in all lines of commerce and industry, which means the abolishment of all trusts and combines; for the pensioning of ex-slaves, according to the terms of the "Hanna Bill," and for a reduction of the tariff. We do not consider the money standard an issue of any merit in this campaign.

Every negro who is loyal to his race and the powers that made him a free man must join with us in heart, if not in action, in this effort to emphasize the fact that the Constitution of the United States is no respecter of persons, but that all American citizens are entitled to exercise all the rights of citizenship, regardless of race or color.

OTTUMWA, IOWA

An Autumn Wooing

BY M. E. N. HATHEWAY

ALONG the quiet country road
They walked and talked, a friendly pair,
Their only reason that by chance
They had encountered there.

And neither was afraid of speech,
For both were middle-aged and wise—
No blushes hastened to her cheeks,
No rapture to his eyes.

Above their heads in skimming flight
Home-staying birds careered along,
Saluting mates in bush and brake
With gentle trills of song.

The distant meadows, hills and woods
Were softly veiled in purple haze,—
And all expressed the peaceful charm
That rules autumnal days.

They talked on subjects common-place,
Of things most trivial far and near,
Unconscious of the spells that lurked
Within their atmosphere—

Awakening thoughts of earlier years,
And dim regrets in either mind
For something which their lives had missed
And nevermore might find:

For they were sure with time and change,
And destiny and circumstance,
That they had drifted far away
From regions of romance.

Then, lo! the little watchful god,
Who wastes no time in sleep or sloth,
Knew his own moment—and sent forth
A shaft that struck them both.

More few and choice their words became,
With loitering steps their way they took;
They rested in the pine-tree's shade,
And paused beside the brook.

They dreamed no more of bedding May,
Or radiant bloom of summer hours,
But twined October's scarlet leaves
With everlasting flowers.

They parted at her garden gate
With fervent clasp of hand to hand;—
And Love flew on content now he
Had made them understand.

TAUNTON, MASS

Why Do Americans Prefer Small Families?

BY LYDIA KINGSMILL COMMANDER

[In her former much discussed article Mrs. Commander gave the facts about small families. In the following articles she gives the reasons why modern people seem to prefer them.—EDITOR.]

IN a former article in THE INDEPENDENT I gave some data indicating that the small family is the American ideal, except among the unambitious poor, chiefly foreigners not long enough in the country to have absorbed American ideas.

Many of the facts presented were collected from interviews with thirty-eight physicians practicing in and around New York City, among people of every social grade. From the same sources I gathered expressions of opinion regarding the causes of the prevalence and popularity of the small family in America. I found a general tendency to explain this social phenomenon upon economic grounds. The consensus of opinion was that our falling birth-rate is directly due to the industrial and social changes of the last fifty years; that it is a result of the American struggle for life; the small family being, under present conditions, the fittest to survive.

Dr. George F. Shrady was recently quoted as saying of the large families of former days, "Our forefathers regarded each child as a prize, each new son or daughter as a help and an additional guaranty against poverty." I brought this to the attention of a physician who has been practicing for more than twenty years, and who says he has noted a marked decline in the size of the American family within his experience.

"Exactly!" was his comment. "And Dr. Shrady might add, with truth, that our American of to-day regards each new son or daughter as a hindrance and an additional threat of poverty. Hence the difference in the size of the family. In the old days children were easily and cheaply raised and soon began to add to the family income. There was room in the country for plenty of unskilled labor, and people were content with low wages and a poor living. To-day that will not do. Children are an expensive luxury. They cost a lot to raise; they are late in getting to work, because of the long training they must have; and few parents get anything back from them. Not that American parents expect anything back. What I mean is that nowadays raising children is all outlay, financially speaking, and a pretty big outlay, too."

The existence of the large family in Europe, and among some classes in this country, was accounted for by several physicians upon similar grounds.

Dr. I. E., who has a practice among intelligent foreigners, and is interested in sociological problems, said: "The size of the family depends upon its bearing upon the struggle for life. In the old countries, especially among the peasantry, the family means earning power. It costs little to rear a child and he early goes to work. In this country the un-Americanized foreigner still feels the same. He expects his child to begin to black books or sell papers in childhood and get money. Among the European peasants, and the same class of people here, the mind is dormant; life is on a purely physical plane."

Dr. A., who has practiced for seven

years in the Italian quarter of New York, said: "The large families of the Italians are easily understood when we realize that almost nothing is spent raising the children, and they begin to work almost as soon as they can walk. You will find that newsboys and bootblacks always come from large families. The large family is the basis of child labor. The Italians are just like animals. They produce as freely and naturally and they expect their children to look out for themselves almost as early as animals do."

Dr. H. M. has a large practice among a low grade of foreigners, Germans, Irish and English, on the East Side of New York City. She does a great deal of charitable work and the majority of her patients are barely able to maintain life. Large families are the rule. The fathers are laborers, bakers, motormen and workers at other low-paid, slightly-skilled occupations. It is her opinion that as a rule the parents of large families are the people who do little for their children, who let them grow up uncared for and untrained, and who put them to work as soon as they can earn anything.

She said: "These people are indifferent how many children they have. The idea is that they cost little to raise and will soon be able to earn. The children grow up somehow or anyhow and are put to work as soon as practicable 'to earn a couple of cents,' as the expression is. They always say 'to earn a couple of cents,' which may mean anything from fifty cents to two or three dollars a week.

"These people look upon their children as a sort of insurance. The man has just a certain number of years to work. Then rheumatism, consumption, an accident or some such trouble attacks him, and he cannot work full time. He is less active and employment is uncertain. By this time his children are getting old enough to 'earn a couple of cents,' and the family pulls through. A large family is an advantage to people of that type."

On the other hand, the American argument for a small family appears to be based upon the desire for a high standard of living for parents and children alike, and the wish to give to the children such education and opportunities as will later fit them for responsible and lucrative positions in life.

The general idea might be summed up thus: The American wants a great deal for himself and for his child. The "full dinner-pail," instead of being the limit of his ambitions, is the bare beginning of his needs. He must have not only necessities, but comforts. It is not enough that his dinner-pail be full, it must be full of the best food that the markets can supply. He must have a comfortable home in a desirable location. In it must be carpets, curtains, pictures, books and, if possible, a piano. He must have education and time to read his books; recreation and money to take him to the theater or concert. He expects a vacation in the summer, a half holiday on Saturday, a short working day and a big pay-envelope. All these things mean life to the American. To attain them is his struggle for existence.

Moreover, he always wants his child to do more, be more and get more out of life than he has himself attained. He knows that high earning power is the accompaniment of intelligence and skill. Our industrial system is so complex; its tasks so delicate; its mechanism so fine, that almost all work demands men or women of alert, keen brains, carefully and exactly trained. Fewer and fewer are the places that can be filled by stupid, ignorant strength. But to fit children to take such a part in our industrial life that they may earn enough to maintain the American standard of living is a long and expensive task. To give to a large family the education and training necessary, and to keep up meanwhile the comforts of the home, is beyond the capacity of the average income. To rear children unfit to cope with the present conditions is to condemn them to perpetual poverty,—a heritage no American will willingly bestow upon his offspring. These are the considerations the American has in mind when he debates the question of family, and what he means when he says he cannot afford many children.

Dr. G. has been practicing for five years among middle class and poor people, typical American working men and women. She is interested in sociology and has made a point of asking women

who desire to limit their families their reasons.

She said: "I find the basic trouble is economic. The general cry is, 'We cannot afford more.' The very poor say, 'Why should we have more when we cannot feed those we have?' Those better off have ambitions for their children in the way of education and cannot afford many. The growing sense of responsibility in parents makes it such an expense to raise children that the majority hesitate about having a large family.

"I have a patient who is the mother of nine children, all married. Not one of her daughters or daughters-in-law wants more than two children; some of them will not have any. They all say they can't afford to; yet any of them is as well off as the mother was when she raised them. I pointed that out to one of them one day,—a woman with one boy. "Yes,' she replied, 'but see what a different childhood my boy has from mine. He has comfort and pleasure; we have a nice home and he has everything he needs. We are giving him a good education and he will, I hope, get along in the world and earn more than any of our family ever did. Those of us who have children all feel the same. You can't get any of us to bring up children as we were brought up,—always going without everything because there were so many.'"

A doctor whose practice includes Americans and foreigners of an intelligent class, in moderate circumstances, said: "Americans, and foreigners who have become imbued with the American idea, have small families because then both parents and children enjoy life more. The newly landed foreigner, especially if he comes from the peasant classes of Europe, thinks it is a great gain to raise a family cheaply and get them earning soon. He is not long in the country till he changes his mind. He sees that it is better to have a few children and make them valuable by giving them every advantage. It is better to have two children earning $20 a week each than six each earning $7 a week.

"He discovers, what the American knows, that the secret of success in the new world is education and years of training. The fittest to survive in our civilization are the trained and educated. Brain rules, not brawn. This is the American idea, and it involves small families, for so much cannot be given to a large number."

A physician who told me of a marked decline of family among Jewish people did not disapprove of it, but said: "I cannot say that under present economic conditions it is desirable for the poor to have large families. I do not like to see them. In this flat-house there is a family of seven children. The eldest and the youngest are studying; they will be well educated, but the rest must work. The parents cannot afford to educate all. Big families cannot get proper opportunities or be well taken care of. It, therefore, seems to me sensible to limit the number of children."

Another doctor said: "I have just been talking to a young man, one of a family of nine, who is having a hard struggle to acquire an education. He said, 'I am a pronounced enemy of the big family. See what a hard time I am having to fit myself to make my way in the world. Those of us who have less ambition will always stay down. My childhood was one of constant denial, and I was turned out to shift for myself half-equipped. All the time my parents were living in a grind of poverty. Had there been only two or three children in the family everything would have been different. I am one of the younger ones and I can truthfully say I'd have been willing to be left out for the general good. Never will I put a big family into the world.'"

Another doctor said: "I can give you a few instances from my practice, which are typical of many more:

"A fireman, who is earning $150 a month, the father of three children, told me neither he nor his wife wanted more. He said, 'It costs a lot to raise young ones right, and I intend to do everything for mine than can be done. If I have a big family I have to spend all my money in rent, and then where do any of us come in for the rest of our living? My youngsters are going to have a good time and lots of schooling. They must have book-learning to get up in the world, and I want them to beat their daddy.'

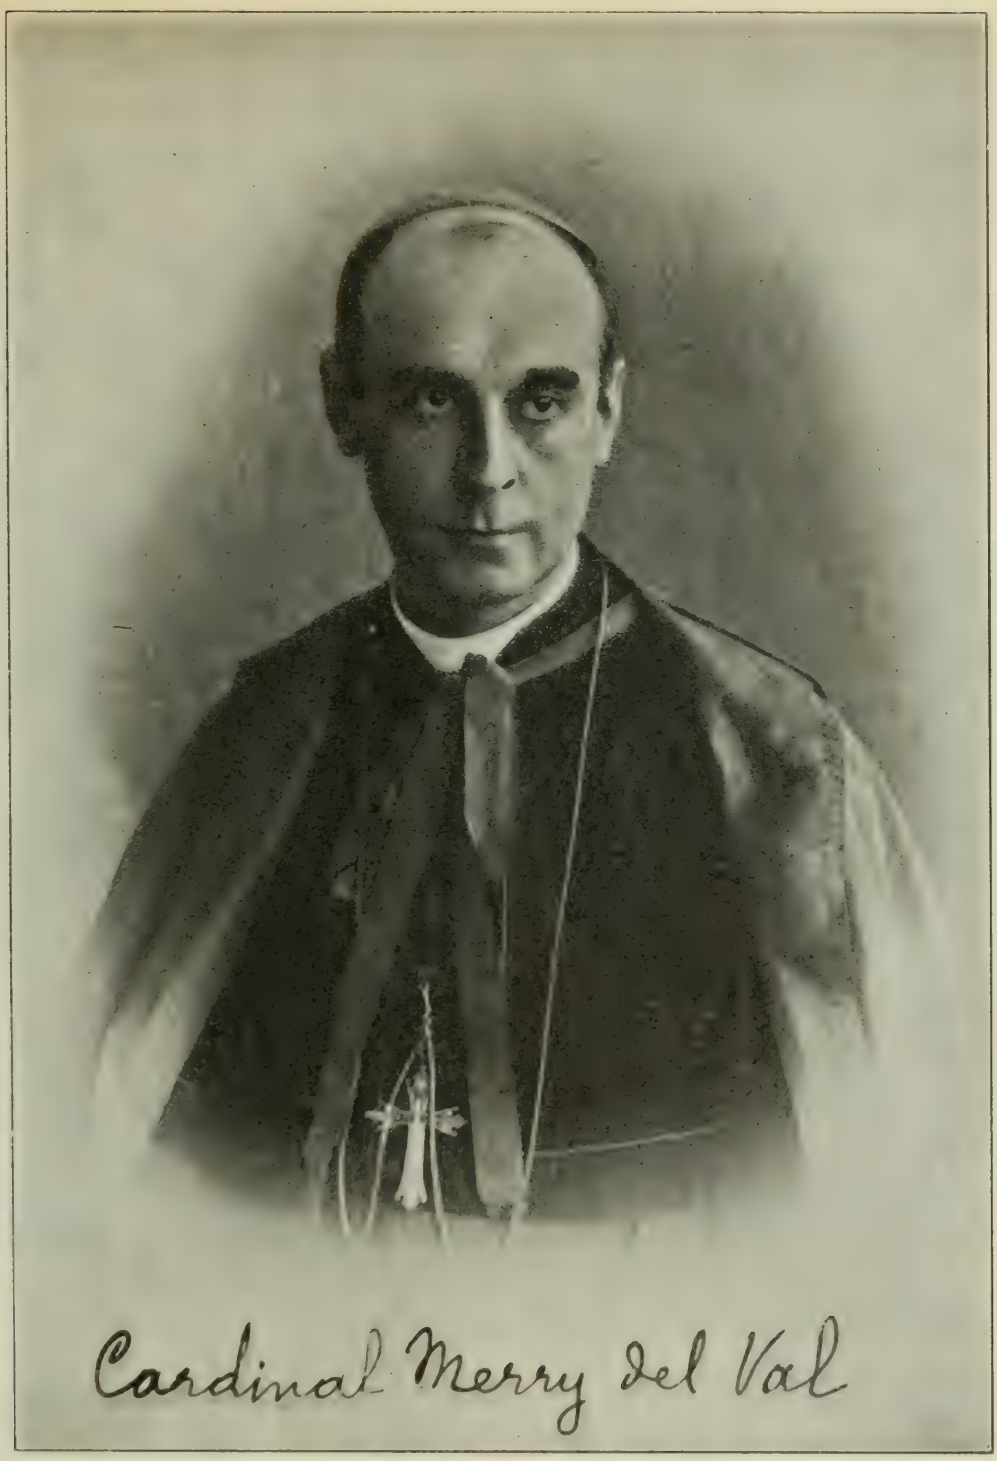
"A woman with two little girls told me she was very fond of children and would like more, but couldn't afford them. 'My husband is a carpenter,' she said, 'and his wages keep us comfortable, but where would we be with six or seven children? He wouldn't earn any more because the family was big. I want my children to be raised nicely and learn everything, so they'll be smart women, and I can do that for two. But I couldn't do much for a whole lot of children. I think two well brought up are better than six or seven that have to go to work before they know anything.'

"A salesman in a big Broadway clothing house said: 'All this talk about big families sounds like nonsense to me. I have two children and I can't afford more. It's a plain matter of dollars and cents, and I haven't got the price. It's nice for rich people, but I don't think poor folks are entitled to a big family.'"

It would be impossible to record all the statements of the men and women who have explained their small families or childlessness upon economic grounds. The general opinion seems to be that a child is an economic disadvantage. As Dr. Shrady says, "Only the poorest classes, who would not know what the word economics, so often used in discussing this vexing problem, means, go ahead and have all the children that Nature sends them." As soon as they do understand something of economics they make a determined effort to leave both poverty and the large family behind them.

The general American attitude, as I found it, is expressed by Rev. John L. Scudder, who says: "The ambition of a man of small means should be to rear two children, instead of ten, as heretofore, and give his children an opportunity to taste a few of the good things of life. Let the rich have large families. They ought to have them, for they have the means to provide for them.

"President Roosevelt can well afford to advocate a multitudinous household, for he gets a salary of $50,000 a year, besides the income from an independent fortune. I wonder how he would enjoy his own advice if he had a dozen children and was getting $2 a day? Circumstances alter cases mightily."



NEW YORK CITY.

The Cardinal Secretary of State

BY SALVATORE CORTESI

"THE Secretary of State is first Minister and sovereign mouthpiece of the Pope, this eminent position being intrusted to a Cardinal distinguished by bright intelligence, together with energetic activity and happy experience in business of all kinds, who enjoys the full confidence of the Supreme Pontiff, and is chosen among the cleverest members of the Sacred College." This is the definition which an authoritative Catholic writer gives of what, in our days, has become the highest and most important official of the Catholic Church, altho there are dignitaries nominally superior to him. This will also explain why the announcement that Pius X had raised to such an elevation the then Monsignor Merry del Val, a distinguished prelate, but young and scarcely known outside the Vatican world, produced such general surprise.

Still, if history were not so easily forgotten, there should have been no astonishment, as Pius IX in becoming Pope, in 1846, intrusted the office of Secretary of State to Monsignor Corboli-Bussi, who, like Merry del Val, had been Secretary of the Sacred College during the Conclave; but was far from being, as regards birth, culture and attainments, equal to the latter, so much so that one month later the Pontiff relieved him of his duties, substituting for him, not a Cardinal, but another little known prelate, Monsignor Santucci, until the definite appointment of Cardinal Gizzi. Gregory XVI, in 1831, did likewise, making Monsignor Polidori, who had been Secretary of the Sacred College during

the Conclave, his Secretary of State. Ercole Consalvi, perhaps the greatest of those who have held this responsible position, was chosen by Pius VII when merely Monsignor and after having been Secretary of the Sacred College during the famous Conclave held in Venice in 1800.

It was remarked that Merry del Val had not even a great name to grace the office, the first holder of which was St. Charles Borromeo, in 1560, and which has had an Aldobrandini, Borghese, Barberini, Chigi, Rospigliosi, Torrigiani, Ludovisi, among its occupants. However, it must be said that the names of the great Houses were not found either in the Sacred College or in the Church at large on the ascent of Pius X to the Pontifical throne.

The present Secretary of State is descended from an Irish family, a member of which, a Mr. Merry of Waterford, went to Spain, about a century ago, to look up some land which he possessed there, and, liking the place, remained, prospering rapidly. From him sprang two branches: one called Merry y Colon,

from an intermarriage with the family of the Duke of Veragua, who claims descent from Christopher Columbus; and Merry del Val, from an Irish wife of one of the family, who was a Miss Wall, whose name was "Spaniardized" into Val. Not only the original Merry family still exists at Waterford, but the Cardinal has two old aunts, the Misses Wilcox, who live in London in an ancient apartment in Portland Square. Nothing more unlike a Cardinal of the Roman Catholic Church than these two rigid Low Church dames can be imagined, who hold in abhorrence all forms and ceremonies, the Sacred College being to them the "Scarlet woman." Into this quiet haven came, a year ago, the news that the nephew, who was some time to see the error of his ways, had been made a Cardinal. Their sensations were mixed, altho disapproval was, on the whole, uppermost, but having a shame-faced regard for the sinner, they austerely answer his letters and hope for the best. The Cardinal seems to have a real affection for the old ladies (who knows that he, on his side also, does not dream of converting them?) and writes often, in one of the latest letters saying that he is employed in teaching the Holy Father French, but that the progress made is not encouraging. The Venetian accent would certainly not lend itself to the French sounds.

There seems to be a destiny in the Merry del Val family to teach languages to great personages, as a brother of the Cardinal, who is a Secretary at the *Ministerio de Estado* in Madrid, was English master to the young King Alfonso; but he, on the contrary, found his task easy, as the royal pupil has a great facility in languages, and, knowing German already from his mother, found English comparatively simple.

The lack on the part of Pius X of the knowledge of any foreign language, it has been said, was one of the chief reasons for which Merry del Val, at 38 years of age, was raised to the purple and to the Secretaryship of State. He, indeed, speaks fluently Spanish, English, German and Italian, as tho each were his native language; and, with regard to nationality, it is rather difficult to establish which is truly his, as he was born in London of a Spanish father and a British mother, was partly educated in England, and when still young and being taken about by his father, who was a diplomat, went first to Belgium, then to Austria and finally to Rome, where he arrived at about the age of 20, and never left again except for short absences. The country he knows the least is Spain, as he has only passed through its Northern Provinces once and has never seen Madrid. He, in fact, strongly objects to being considered Spanish, his feelings and sympathies being entirely with the Anglo-Saxon world, so much so that in his official title before being Cardinal he was designated as "Monsignor Merry del Val of London," and among his brother prelates he was known as "the Englishman." After the death of Cardinal Vaughan he was included in the terna of candidates to succeed him as Archbishop of Westminster, and he might perhaps have been chosen had it not been for the strong opposition of the Duke of Norfolk, who certainly did not dream what a great service he was thus rendering him.

The Cardinal's first schooling was at Ushaw in the North of England, where he was chiefly noted for his charming manners and love of out-door sports, rather than any special cleverness at his books. Even now, altho Cardinal and Secretary of State, he does not disdain golf. He is often to be seen at private links in the Villa Doria, which is certainly an innovation in a member of the Sacred College, and, it must be confessed, causes the good Cardinals great uneasiness.

While this uncertainty of nationality may, under certain aspects, be an assistance to him, under others it is disadvantageous, as some of his actions or attitudes are set down, not to the necessity of event, or the duty of defending the interests of the Church, but to the Spanish, English or Italian feeling which his opponents choose to attribute to him. It will be remembered that an attempt was made immediately after his nomination to make him appear the incarnation of the historic and proud Hidalgo and a ferocious anti-American. The truth is just the contrary, as he has always felt a great admiration for the United States, especially for the progress and vigor of

Catholicism there, while his connections in Rome have been much with Americans, and one of the last great dinners at which he was present before the death of Leo XIII was at the American College.

Journalism finds no supporter in him, who, in the bottom of his heart, certainly shares the opinion of one of his famous predecessors, Cardinal Antonelli, who used to say that the best employment for newspaper men would be to put them to draining the malarious Campagna Romana. This feeling, however, does not blind Cardinal Merry del Val to the fact of the immense power which the press has in our days, and, therefore, he does not disdain to influence public opinion through its medium. With some of the journalists whom he knew before his sudden rise, he has maintained the same cordial relations; America being represented to a considerable extent, and among his favorites is an old schoolfellow, Monsignor O'Kelley, better known in the Catholic press of the United States, as "*Vox Urbis.*" Indeed, in his first year of office the Cardinal personally participated in one of the most important and fiercest battles sustained by the Holy See through the press, as most of the articles published in the *Osservatore Romano,* official Vatican organ, to rebut Premier Combes arguments in his struggle with the Church, were written by him.

He has directed the policy of the Papacy in its most perilous times, since the fall of the temporal power; and his adversaries, recalling that in all his career the only missions he had were to accompany Cardinal Galimberti to Berlin, in 1888, for the death of William I; to spend a year in Canada as Apostolic Delegate in 1897, and to congratulate King Edward on his assumption to the throne, in 1901, attribute the reverses sustained by the Holy See to his lack of diplomatic ability. They remark that, especially with a Pope like the present, untrained and unadapted to politics, Merry del Val is much below the standard required, when the need of a Ximenes or Richelieu, of a Mazarin or Alberoni is felt; and they predict that his reign will be short. They evidently forget that one of the chief reasons for which Pius X chose Merry

Cardinal Merry del Val at Castle Gandolfo, the Papal Summer Palace

del Val as his Secretary of State was that of having a servant who would leave him a free hand, as a member of the Sacred College who had elected him would not have done, one to whom he could say, in Christ's words, "*Non vos me eligistis, sed ego elegi vos,*" as he received everything from the Pontiff.

In conferring the purple of his Secretary of State, Pius X said: "It is, indeed, sweet for us think that you, with the virtue, knowledge and prudence which you have hitherto shown, meriting our full confidence and benevolence, will be of powerful assistance to us, while our life lasts, in the government of the Church, especially in those relations which we must have with the Governments, to protect the liberty of Catholics, and to call to the true faith the dissidents and heathen."

This seems an explicit promise that Merry del Val will remain Secretary of State as long as Pius X lives.

ROME, ITALY.

The Tribulations of a Child

[As this story is a transcript of a real childhood the author properly prefers that her name should not be published.—EDITOR.]

I HAD a little pink saucer face, China-blue eyes, very light hair that sat up fuzzily on my head,—and I was a girl! But the limitations of sex did not confront me with all its mortifying significance until my seventh year, when I was forbidden to "ride straddle," skin the cat, climb trees, or indulge in any tomboy exhibitions of human nature, because the same were not "lady-like." I had no very clear idea of what lady-likeness meant, but from the faded grandeur of a certain maiden aunt, I inferred that it must be a tedious vocation.

We lived in the country on a large cotton plantation, but more particularly I lived in a magnificent castle, outlined with stones and bits of glass, under an old horse-apple tree in the orchard, and in a fortress which to the unimaginative eyes of my elders appeared to be a square corner in the pasture fence, roofed over with pine boughs. I was always barefooted in summer, and I wore long sleeved gingham aprons that drooped behind and parted like the tail of a sparrow. My father was what is known in the South as an "aristocrat." That is to say, he was the great-great-grandson of an old gentleman who vowed that he knew himself to be a remote left-handed descendent of Henry VIII. And there was much in father's character and disposition to bear out the truth of this ancestral proclamation. My mother's family, however, made no such scandalous claims to lineage. She came of highly respectable, godfearing people; and inherited from them a set of hard-featured virtues, together with some Calvinistic notions regarding the future state. This is important to mention, for I was more especially the child of my father, but mother predestined in her own mind to correct all the nefarious tendencies of an aristocratic temperament discoverable in me. She firmly believed in my total depravity, but she determined to reconstruct me along the theological lines of her own family.

This accounts for the fact that the earliest period of my recollections is entirely covered by the Ten Commandments and by the terror I had of a certain pit of fire and brimstone, presided over by a horned being with a forked tail. I was limited in mind and spirit by the Commandments, and all the little lambkin thoughts of my infantile imagination were herded in terrified flight before the ever-present, threatening being with the forked tail. At the age of five I was morbidly anxious to flee the wrath to come, and, indeed, never felt safe anywhere from the all-seeing eye of God fixed upon me with a judgment stare, on the one hand, and the wiles of the Devil on the other. The shadow of an over-

passing cloud was to my mind the frown of heaven, and quickly routed me from the most engaging play. There was a deep gorge on the plantation, which, for all I knew, might be the doorway into Everlasting Darkness. I never mentioned my fears to any one, and to have been assured that it was simply a huge hole in the ground would not have quieted them. All my faculties had been absorbed by gruesome notions of darkness hereafter, and it was impossible for me to escape the hallucinations of my own horror-stricken imagination.

But beside this maternal imposition of piety, I became something of a Pharisee in my own right. I learned to read very early, and now I took an unseemly pride in committing to memory such passages from the Bible as appealed to my diseased mind. Indeed, it is impossible to say to what Scripture ends my ambition might have reached had I not in a moment of exultation climbed upon father's unsanctified knees and repeated that chapter of Genesis which sets forth the generations of Abraham. The word "begat" stuck like a peg in my mind, and upon it I hung verse after verse with breathless haste. But so far from praising the performance, father was indignant. There was a scene, and in the course of it he imparted the astounding information to mother that a distant cousin to his grandfather had been insane on the subject of religion. Since then every member of his family felt the necessity of avoiding spiritual extremes. He conceived that my unnatural taste for the Scriptures portended this mental disorder and he peremptorily forbade my receiving further instructions in them.

Thus ended my religious training for the time, and by the following spring I could not have told whether Adam or Henry VIII was the first man. But from father's account I felt the immeasurable advantage of having descended from the latter rather than from the former. I learned from him also that the unpardonable sin in our family was cowardice, the fear of things. On a certain candle-lit evening, when mother was in the foreign regions of the parlor presiding over a meeting of the Woman's Missionary Band, we exchanged confidences concerning our own side of the house that made a lasting impression upon me. I stood between his knees trembling, because the shadows in the dark corners of the room were disposed to jump up and down malignantly, while he told me of many instances which proved conclusively that no one in his family had ever feared anything, as far back as Henry VIII himself.

"Father," I whispered, conscious of the treason to mother's people in the question, "weren't they even afraid of God?"

"Not even of God!"

That settled it. My judgment was not ethical and I did not pause to compare the reckless, irresponsible spirit of one parent with the sober integrity of the other. I felt the call of my kind, the supreme obligation of living up to the standard of my own personal forefathers. The Presbyterian ambition to become a saint grew faint within me as I contemplated the larger reputation of deeds accomplished through invincible courage. The shadows in the corners were creeping monsters now in the fitful firelight. And I regarded them with the fascination of a coward inspired for the first time by an heroic impulse. At last, fortified by the dimmer shades of my irregular Tudor ancestors, I withdrew from father's protecting embrace and slowly advanced upon them, hesitated, then swept a small hand tremblingly over the enchanted wall, gave it a defiant kick and returned with forced deliberation across the room pursued by innumerable goblin shapes.

It was not a matter of which either of us could speak. I had too much of a terrified past to live down, and could not afford to boast; but I think father had some sense of the spear-points gathering in my mind as we sat clasped together in heroic silence. This was later confirmed when I announced to mother that I would not need her to put me to bed.

"But you have not said your prayers," she reminded me, for I had been accustomed to repeating my little orisons with her hand upon my head.

"I will say them in there," I replied, marching bravely into the small dark room where I slept alone. And as I now recall my sensations, I doubt if I ever did a braver deed. The formless aboriginal horrors, from which my little hag-ridden spirit had been evolved, crowded

about me quaking beneath the counterpane. Besides, there was God, from whose awful eye mother assured me I could never escape. If I could cope with God there in the dark, I felt that the rest would be easy to endure. And so fixing my mind upon the long line of knights of whom father had assured me, and who were never afraid, I was finally able to uncover my face, stare bravely up into the darkness and whisper:

"God, I ain't afraid—even of *you!*"

This was not a challenge, nor even a fact, but an announcement which took the place of my ordinary petition, and meant much more, for it delivered my childish spirit from the thralldom of religious fanaticism. After that time the Ten Commandments seemed to recede into the nightmare regions of bad dreams. I became carnally minded, and hilariously happy. My brown legs fattened, my imagination expanded worldly wise, and I had that sense of mental freedom which enabled me to think in any direction as far as fancy would carry me, regardless of the truth. Thus I began to tell the most incredible tales, and often scandalized mother with accounts of adventures far beyond my capacity. On the level plains, I climbed the Alps; drenched in the meadow brook, I returned to tell of swimming the Thames. And the more I was punished, the more did it seem to me that self-protection depended upon the wariness of my imagination. Never once did I take refuge in plain facts. Such common place ones as I knew were out of all keeping with the spectacular performances of my knight-errant ancestry, and I bitterly despised them for this reason. I was determined to claim experiences that would do me equal credit with them in history, and to this end I did not spare my little apocryphal faculties. Neither did mother spare the rod. But my chastenings were to no purpose; for I practiced heroic fabrication so successfully that I more than half believed my own tales. Mother, whose consciousness was founded upon prayers and doctrines rather than upon a romantic tradition of royal ancestry, grieved over my abandoned state and was at her wits end for a moral remedy. Meanwhile, I was never reduced to such an extremity. The more I was persecuted for mother's righteousness' sake, the more real did the glamour of my circumstances become. And seeing that my beautiful ebullitions invariably resulted in my personal affliction, I took refuge with a certain family of prince's feathers that grew in our garden. These were very tall, handsome plants, and their magnificent crimson tops reminded me of my royal ancestor. Therefore, with all the formalities that my ingenious mind could invent, I approached them daily, sometimes as a lonely pilgrim bound for the Holy Land, but more often as a herald from the battlefields of my own bloody imagination. Kneeling among their dark leaves, with my eyes fixed adoringly upon their flaming crowns, I sang "of men and of arms" in a manner that would have made that old Boswell of the immortal Trojan green with envy.

It was during this sixteenth-century-period of my development that I unwittingly defeated father for the legislature and cast a red shadow over his already too highly colored reputation as a law abiding citizen. Two years before he had come into possession of the plantation that had been the seat of his family dynasty since the time when the proud, old, left-handed descendant of kings cut it out of the Southern wilderness. And I yet recall father's inordinate pride in the family burying-ground, so thickly and exclusively settled by the bones of his forefathers. He was at great pains to inform me of the historical merits of each. I noted with interest that tall slim monuments marked the graves of the men, while the stones set over the heads of my respected aunts and grandams were broad and short; therefore, with childish deduction, I inferred that they were all of low stature and very fat.

It appeared also from these tombstones that the male members of the family cultivated political aspirations. Most of them had served in the legislature, and one had reached the dizzy hight of the State Senate. Now, father's great ambition was to live up to his illustrious past. And no sooner were we comfortably settled in the old home than he began to plan that most mysterious of all things in the South, a political campaign. Before this time we had lived very quietly; but now we had much company, and mother's parlor became the social center of social life in the neighborhood. To

me the honey-tongued flattery of accommodating guests was a new and delightful experience. Thus, during the diplomatic hours of the sunny afternoons, I was always to be found seated in the shade of a tall column on the front steps in happy anticipation of being called a "cherub" by some passing visitor. This was how I came to meet Mrs. Pettigue, whose husband "controlled" every vote in the Beaverdam district—if I had only known it! She arrived in a carriage driven by a wasp-waisted coachman, and her magnificent appearance filled me with delight as she descended and bore down upon me seated primly in the sand before the door. The formalities of the occasion did not permit her to acknowledge my existence, as I was not very clean. But I followed her into the parlor with the fascination of one who has at last seen an appropriate vision. Mother was delayed, doubtless in the effort to make her own toilet better accord with the importance of the occasion. The shades were down, and the room so dark that Mrs. Pettigue's further failure to observe me was excusable. But from a remote corner of the old horsehair sofa I regarded her with absorbing attention. I wondered if she knew that Henry VIII was left-handed and had, through this inscrutable providence, become the greatest grandfather of our family. But mother had forbidden me to speak of this to our guests. Still, as I contemplated her resplendent in silk and lace, I longed to tell something that would atone for the simplicity of my own clothes and at the same time reflect glory upon my house. Her eyes were flying swiftly from one patriarch to another on the walls with the unbridled curiosity some women show only when they are alone. But the silence was intolerable to me, and I made a gallant effort to attract her attention.

"Father killed a man last night!" I announced with startling distinctness.

There was a rustle as if the shock had shivered through her mass of silk and ruffles. I could see that she paled, and showed those signs of incredulity so hateful to endure, as she turned and beheld me sitting stiffly opposite her, desperately still lest I should slip off the slick horsehair cushion upon the floor.

"What—what did you say, child?" she exclaimed, as I fixed her with a blue stare of infantile innocence.

"Father killed a man in a duel, and buried him in a hole under the gin house last night," to verify which statement I pointed to the gruesome building plainly visible through the window. I felt a most bloodcurdling tale arising, scene after scene, in my happy mind. However, mother appeared at this moment and I prudently restrained my creative faculties. But Mrs. Pettigue was in no mood to visit now, and, with a show of grim politeness, she almost immediately took her departure, leaving mother indignant and mystified.

Meanwhile, when the nomination seemed sure, father was outraged at receiving an intimation to the effect that he must clear up the mystery of the "dead man under the gin house." At a district meeting on the following day, he made an eloquent speech, denounced the report as a campaign lie, and challenged the author of it to face him. But his protestations were received in enigmatical silence. No one believed an innocent child capable of tell such a story without provocation, and it was well known that more than one member of the family had fought duels, including father himself, upon a certain impromptu occasion. In vain did he invite the whole countryside to explore his gin house, in vain did he call for the name of his supposed victim. There were plenty of strangers, his enemies retorted. Besides, it was not the man they cared for, but it was the principle of the thing. The country, he was informed, had outgrown some notions of satisfying honor held by his family, and, if he were wise, he would retire from the race. This, in fact, he was finally obliged to do,—after challenging the leaders of the opposing political party, including the rival candidate himself, to deadly combat, one at a time with pistols.

Naturally, I heard nothing of his straits. In my castle under the apple tree, or parleying with the prince's feathers, or preparing for a siege around my fortress in the calf-pasture, I pursued the even tenor of my way, oblivious of the fact that I had eclipsed the family socially and politically for an indefinite period.

But to pursue the even tenor of my

way became an increasingly difficult business. I was a spirit without an element, and all realities seemed to refute my happy ideals. The lonely plantation was like an inland kingdom, it is true, and the score of negro families that lived on it sustained much the same relation to us that the peasantry of England did to their feudal lords during the Middle Ages. But there was always the alien factor of mother's puritan principles to be reckoned with, and I could never quite escape the moral impetus of her mind. When it was possible, I avoided the house now altogether. The uncompromising integrity of all she did, the stern virtue of all her views, oppressed my little vagrant spirit. Even the quality of her affection terrified me, it was so entirely reformatory. In the light of her world, I felt that I must be "born again," and I was disposed to put off the ordeal as long as possible. Thus I became a veritable little fugitive, with a price set upon my head. The castle under the apple-tree was abandoned because it was in sight of the house; even the fort ceased to be a safe retreat. I wandered further afield—into the woods where the grey squirrels frisked among the boughs and thrushes hid, like little brown friars, beneath the deeper shade to sing their evening hymns. There was in particular a shallow fern-fringed brook where I often refugeed during seasons of unusual domestic activity. Here I performed rites according to the mood that possessed me. Or I would leap into the boiling waves to rescue my companion, who might be a brightly hued autumn leaf, or a cat-tail knight. But it was impossible to convince me that I was under obligations to a moral order composed of spelling, reading and writing. And every appeal to my conscience was a waste of mother's eloquence. I felt the virtue of the peace I enjoyed in the forest. The integrity of my spirit was founded upon the wideness of green fields and the wisdom of wind-whispering trees. I became shy and diffident when forced to remain in doors. Like a homesick starling, I beat my young wings against the bars of my unhappy fate until an opportunity of escape offered. Then, with a flash of apron-tails and a twinkle of bare brown heels, I was away into the wild world of bird-song and secrecy.

Once, I remember, that in the early morning I rode with father after the hounds in a fox hunt through this same forest. The hunters loomed large on the lantern-lit lawn, the dogs crowded joyfully under foot; and I see yet the figure I made rushing out bareheaded, half-buttoned, begging to go. And father, to whom every lawless impulse was a sign of courage or genius, held out his stirrup for my aspiring legs and arms to climb. A moment later, seated astride the rim of his saddle blanket behind, holding fast to his waist-band, we were off. The horse we rode was long, thin-flanked, with a motion so gallant and swift that my heart pounded joyfully. A light rain had fallen during the night and now the ground was covered with a glistening carpet of autumn leaves that stirred beneath his flying feet like many-hued wind-blown blossoms. The chase led first through the level fields; and by looking through the crook in father's arm I could see the stormcloud of hounds flying far in advance over the meadows, thickening now into a furious mass, and then spreading like a thin vapor of legs and tails into a wider circle. The deep bell-notes of the leader were clearly distinguishable as she ran with nose close to the ground and ears rising and falling like black butterfly-wings. My head whirled dizzily as we gathered speed.

The East was reddening now. As we entered the forest, the bright sun-banners of a new day were flaming above it. But within, heavy shadows lay like huge shapes of the night pierced here and there by a long arrow of yellow light. Great, round spider-webs hung like fairy wheels of silver among the trees. The bark-odor of nuts mingled with the damp fragrance of moss. Startled birds swept pretty circles with their wings, and from every side came the echoing chorus of the hounds. My legs were scratched by the low-hanging boughs, my head was covered with a ragged hood of glistening spider webs; but I felt the wine-joy of a hundred ancestors coursing in my veins. Altho the chase was short, to me it seemed happily interminable until it did end in a little tangle of ferns by the brook. The blood-splashed leaves shone so brightly! I remember them yet, beat down like an army of green swords.

Afterward, for a long time, all the

dates in my life were reckoned from that hunt; for I never went again. Mother declared that one fox-hunter in the family was enough. And it was upon this occasion that I was finally forbidden to "ride straddle."

And now I come to the crowning tragedy of my childhood. The incident was, indeed, small but, measured by my suffering, it was of much importance. During the winter of my seventh year, when the weather had routed me from all the airy turrets and woodland retreats outside, mother determined by a process of elimination to confine my attention more closely to neglected studies. Among other restrictions, I was forbidden to "play dolls." Then followed a series of cruel evictions, which I cannot recall without compassion for the lonely child who was driven from one sun-shiny corner to another, more remote, less desirable, with her afflicted doll family. Nor was this the worst. If a single member of it was left exposed to mother's relentless persecution, it was summarily cast into the flames. For biblical reasons, this was peculiarly harrowing to me.

At last, after many heart-rending scenes, but one doll remained. This was Mary Queen of Scots, a small dingy cotton-stuffed lady with a bit of sheep's wool sewed on her head. Possibly it was the interest I had in doing her hair, or it may have been her historical setting that made this doll dearer to me than the others. Certainly, I guarded her more jealously, and, in a final effort to preserve her, I made a hasty refuge one day in the drawer with my Sabbath clothes. These were sacred garments, never worn except upon important occasions. I rolled them together in a small bundle, which in the course of time was marked with many grimy finger-prints, and devoted most of the space to the queen and her royal effects. Here, seated upon the dressing-room floor, I passed many surreptitiously happy hours, serving her majesty and looking after the bloody affairs of state.

But, alas for us both! the time arrived when mother was accustomed to pay her annual visit to one of father's distinguished relatives. This was a social obligation of such importance that I was expected to wear my sacred "Sunday clothes." Then the retreat of the poor queen was discovered. When the damaged finery was displayed, I was summoned and compelled to surrender the royal hostage. The only concession I could win was that of obsequies. Provided I buried her deep enough, mother was willing for me to enjoy the mummery of a funeral. And so I remained at home, while she went to pay the promised visit, to mourn and to shroud the queen. But, upon reflection, it became evident that I had nothing suitable for this purpose, for I was determined to lay her away with as much pomp and circumstance as I could afford.

Now, it so happened that mother had long worn black. Indeed, she had reached that moderation in the experience of bereavements where she was disposed to graduate her emblems of wo according to circumstances. Thus, when an infant died somewhere in the family connection, she wore a crèpe hat. But if the deceased was an adult and a near relative, she put on a bonnet with a long, lugubrious crèpe veil that covered her so completely that it was impossible to tell which was the front and which was the back of her grief-stricken figure. And on this fatal day, wandering about the house, filled with the copying instinct for a dramatic funeral, I had the misfortune to be tempted by the black tail of this bonnet. It appealed to my dark, grief-stricken mood. And, as it was so long, I concluded that mother would scarcely miss a portion of the back width. This I cut off and buried the poor queen in it. A bunch of artificial forget-me-nots, taken from my own summer hat, furnished floral decorations. And that night I retired with the chastened satisfaction of having done the best I could for royalty, under the circumstances.

Many months later, when mother put on the bob-tail bonnet for another funeral occasion, I realized the desecration I had committed. From being the most imposing spectacle of wo, the shortening of her black drapery was an insulting caricature upon grief. And the punishment received for this offense effectually ended the Tudor period of my development. I submitted tamely to mental and domestic discipline, even to the extent of learning the multiplication table and sewing. And for many a year now mother's wisdom has been like a candle lit for me in all the dark ways of life.

Literature

PROFESSOR WILHELM HERRMANN
Of the University of Marburg
From a photograph in the possession of Rev. John M. Thomas

Wilhelm Herrmann, the Man with the Ethical Spectacles

WILHELM HERRMANN, two of whose best known briefer writings are here translated,* is the most celebrated teacher of systematic theology in Germany. Through a long period in which doctrinal theology has been under suspicion, and criticism and history have held the chief interest, Herrmann has filled large lecture rooms with eager students, his utterances at religious conventions have been widely discussed, and his writings have passed through repeated editions. For 25 years he has taught in the quiet city of Marburg in the beautiful Lahn valley, and next to Berlin it has been the most sought of German university towns for theological students of all nationalities. There Harnack won his spurs, and there to-day Budde, Jülicher, Mirbt and Johannes Weiss, together with Herrmann, make up one of the most brilliant theological faculties to be found in the world.

Herrmann's influence and power consist as much in the charm and fascination of his personality as in the vigor and clearness of his thought. He is a most kindly man, so manly, yet so thoroughly good. He lectures with an intensity of conviction, a depth of emotion, sympathy and religious feeling that cannot fail to make a profound impression. He is quiet and calm in delivery, never confused or excited, follows always the logical order in the utterance of clear, massive thought, yet you feel the Christian believer not less than the systematic theologian, and one hears from German students *ein wirklicher Gottesdienst!* while it is the common remark of the Scotch and English that the *sermons* of Marburg are delivered in Herrmann's lecture room. French students liken the impression they receive from Herrmann to the spell which the late Auguste Sabatier threw over his listeners.

Three reasons may be mentioned why the work of Herrmann should be better known in America. The first is his insistence on the intimate relation between religion and morals. He says: "In order to understand the Christian faith we must begin with the ethical problems of our own life" (Ethik, p. 6). Through our moral struggles, according to Herrmann, we arrive at the knowledge of God. In the right, which comes into our life to command, to bend us to its will or shame us if we will not bend, we grasp first the idea of God. We can appreciate God's revelation, and understand it, only in proportion as we are morally in earnest. The real supernatural is only in the moral life. It is the hold of our spirit against all solicitation from outside. In the moment when we win power of dominion over our natural inclinations, we first grasp clearly the idea of the supernatural.

* FAITH AND MORALS. By Wilhelm Herrmann, D.D. Translated by Donald Matheson, M.A., and Robert W. Stewart, B.A., B.Sc. New York: G. P. Putnam's Sons. $1.25 net.

Herrmann is called by his students *Der Mann mit den ethischen Brillen,* the man with the ethical spectacles. Not only does he start in his exhibition of religious truth with the moral problems of our own life, but every phase of Christian doctrine is considered from the ethical point of view. The result is new light on many a doctrine that seemed dull and lifeless. Herrmann's ethical spectacles method makes systematic theology a live subject, intense with human interest and warm with religious feeling.

A second reason why Herrmann will repay study is his emphasis of the fact that religion is based on revelation and not on proof, that it is a matter of personal conviction and not of scientific demonstration. With Herrmann religion can stand and walk alone, and is not dependent on the crutches philosophy may be kind enough to furnish. He holds that in the moral imperative, and in the impression which the moral and spiritual elevation of Jesus make upon us, is a reality which does as a matter of fact command the Christian heart, and thus constitutes a revelation of God. Faith is humble obedience to the power thus revealed, and is by no means the effort to believe things we do not understand. To this view of religion historical criticism has no terrors, nor do changes in philosophy mean changes of faith. It is worth study whether this free, open field for religion is not open for us all.

The third reason why all helps to wider acquaintance with Herrmann's thought should be welcomed is found in his opposition to mysticism. A deeply spiritual man, he nevertheless despises cant and unreality, and flights of the soul away from duty and the facts of the solid earth. His writings are a needed antidote to the mystical unreality which spoils some of the most earnest and pious religious writing and preaching of the day.

Herrmann has been known heretofore to English readers at first hand only through a translation entitled "The Communion of the Christian with God." This title smacks of mysticism, and the book has often been misunderstood on this account. We have now, in "Faith and Morals," translations of his address on assuming the rectorship of the University of Marburg in 1890 on the "Protestant Faith and the Theology of Albrecht Ritschl," and also an address delivered in 1899 on "Protestant and Catholic Morals," since expanded by controversy into quite a treatise. Neither of these addresses sets forth the distinctive and important opinions of Herrmann in complete and orderly form, as would a translation of the *Ethik,* or even his most recent address on "The Moral Precepts of Jesus." Both the works here translated are products of occasions; yet, in both, the important elements of Herrmann's teaching appear to the thoughtful student. These discourses demand patient, careful study, but they are worthy of it, and no one can rise from an effort to master them without clearer views on the fundamental convictions of faith, especially on the intimate connection between the moral and spiritual life.

The translation is indifferently done, being in general too literal, and in some cases, as on p. 191 and p. 326, it misrepresents the author. To many readers the division into sections and insertion of paragraph headings hinders rather than helps in following the thought. Notwithstanding these defects, it is seldom a theological work appears more fitted to clarify thought and stimulate real religious feeling and genuine piety.

Letters Which Never Reached Him

These letters* are dated from various points, in Canada, New York and Berlin, during the year included between the Augusts of 1899 and 1900. And they purport to have been written by a woman to a friend left behind in the besieged Legations at Peking. He is killed on the last day of the siege; and shortly after learning of his death the author dies of grief. Her sister recovered these "letters which never reached him" from the postal authorities at Shanghai, and they were published in Germany last year, where they had a great sale.

The average woman who writes letters to a man even for publication does so in a declamatory style, bewitching, but not literary. She speaks, wrings her

* The Letters Which Never Reached Him. New York: E. P. Dutton & Co. $1.50.

hands, weeps and throws kisses with her facile pen. And the substance of what she says is strictly personal. If a bit of scenery is thrown in, it is done to furnish a pretty background for the self-made heroine. But the author of these letters writes in a monotone, as if she were already addressing the dead. And she writes with a sublime impersonality which shows she has a proper sense of relationship between herself and greater things. Her descriptions are also remarkable. It is the fashion now to write of natural scenery with the same use of words a man makes of paint on a sign-board. In the effort to achieve a blue sky or a rainbow for our landscape, we are too lurid. We forget the shading. The sun sets in a red nightshirt and the moon paints her face. But this author has a sense of natural contrasts which never betrays her into these trivialities of coloring. And her letters contain many admirably veracious interpretations of scenery and scenes. Added to this, she has a political comprehension of conditions in every country through which she passes which proves her the companion of statesmen. We have a glimpse of China through her eyes, struggling like a dying yellow carcass, while all the nations of the earth circle about like ravens ready for the monstrous feast. Her comprehension of affairs in other countries is no less intelligent. And beneath it all lies hidden the same hero worshiping heart of all womankind, which gives to every man, whether dying in Pekin or living in America, the keynote of his greatness.

Imitation as a Social Factor

It is certainly a striking comment on our interest in the more abstruse phases of sociology that Tarde's first and best work * should have waited thirteen years for an English translation. Tarde himself needs no introduction to those well informed in the theory of sociology. He was one of the speakers invited to address the International Congress of Arts and Sciences which met recently at St. Louis, and his untimely death was an especial disappointment to the American public. The present work is marked by a philosophic insight, a command of historic material and a power of brilliant illustration that hold the interest to the least as to the most important details of the theory. Tarde was philosopher as well as sociologist. There is thus found in his work a harmonization of the social with the physical and the vital orders, under an illuminating study of "universal repetition."

Tarde's idea is that the essence of all social facts is to be found in the phenomena of imitation, the repetition of the social world, just as that of the physical world is undulation and of the vital, vibration. But the only things that can be imitated are beliefs and desires. They are the social substance or force. Here it is where Tarde, who believes with Giddings, Ward and many others that sociology rests on psychology, opposes the biological or "organism" sociology of the Spencerian school. Social institutions, according to Tarde, depend entirely upon the agreement or opposition of beliefs which limit or reinforce one another. The true object of desire is belief. Desire is the dynamic, belief the static, element.

Imitation, in the ordinary sense, is the conscious and deliberate reflection of another's desires or beliefs. In the sense that Tarde employs it there is included spontaneous and involuntary suggestion as well. In fact, the term imitation-suggestion would be far more acceptable. A clear idea of the nature of this imitation-suggestion may be obtained from the following illustration:

"Consider the phenomena of hypnotism. The social man is a veritable hypnotic. The social, like the hypnotic state is a dream—a dream of command and a dream of action. Both the hypnotic and the social man are possessed by the illusion that their ideas, all of which have been suggested to them, are spontaneous."

These imitation-suggestions, being essentially social facts, must have a source and an outlet, a model and a copy, for every imitation must have an initiative. The first model was the father. Gradually the source of imitations extends to the clan, the tribe, society at large. In every case, then, is imitation of the su-

* LAWS OF IMITATION. *By Gabriel Tarde. Translated from the Second French Edition by Elsie Clews Parsons. With an Introduction by Franklin H. Giddings.* New York: Henry Holt & Co. $3.00

perior by the inferior, and later an increasing play of mutual imitations. This play of imitations, whether unilateral or reciprocal, is the cause of all social resemblance:

"All resemblances of *social origins* are the direct or indirect fruit of the various forms of imitation—custom, or fashion-imitation; sympathy, or obedience-imitation; precept, or education-imitation; *naïve,* or deliberate imitation."

But social likeness is not the whole of society. How explain social difference? Tarde's answer is—by invention:

"Any kind of innovation in the range of social phenomena, the reinspiring initiatives which bring new wants with new satisfactions into the world, and which through their spontaneous and deliberate imitation propagate themselves like a ray of light."

Imitation and invention, however, must not be understood as opposed, but, on the contrary, as completing each other. For the second factor arises from "the intersection in the brain of several rays of imitation, resulting in a new product."

With these two brilliant conceptions as a searchlight Tarde illuminates all the phenomena of the social world. Suggestive, for instance, is his explanation of the Great Man. The Great Man is merely an imitative animal, a product of his time, bound down to the series of imitation rays of which he is the center. But his greatness consists in a new combination of these imitations, so that the product is a counter-imitation, which, if it survives, will break the equilibrium of the social forces and secure progress.

Social action is, therefore, a series of imitations, each starting from a certain initiative or invention. The innovation, seizing hold of society, spreads through the social mass in geometrical progression. The contagion ever increases in its range, until finally it is established as the normal order from which all new innovations will arise.

These reflections constitute in the main the first two chapters. In the third, "What Is a Society?" he takes up a consideration of the economic and the juristic conceptions of society. He does not give, to our mind, an adequate description of the economic theory, neglecting almost wholly its larger aspect, what is known to-day as the economic interpretation of history, tho the attitude maintained throughout the work is antagonistic to such an interpretation. In accord with the theory above outlined Tarde says:

"Society is a group of beings who are apt to imitate one another, or who, without actual imitation, are alike in their possession of common traits which are ancient copies of the same model."

The Coming Race

HERODOTUS tells us that the ancient Persians were accustomed to debate all public questions twice, once drunk and once sober. Mr. H. G. Wells apparently has a similar idea as to the advisability of the public consideration of a subject in two moods, for he is accustomed to present his views in both a fantastic and serious style. The difficulty with this is that people have become so used to regarding him as a mere scientific Munchausen that they refuse to take him seriously and to give to his really important work its due attention.

On its face *The Food of the Gods* * is an extravaganza having for its motive the development of a race of giants by feeding them on a chemically prepared food. The idea of this comes, undoubtedly, from the recent experiments in this country and Europe on remarkable accelleration of growth by the use of lecithin, a phosphate fat. But this, tho startling enough in its results to stir the most sluggish imagination, is used by Mr. Wells as the basis of what is not the less an allegory for being in itself a good story. In it he satirizes the way a conservative world receives any new and revolutionary idea, the indifference of the public until personal interests are touched, the attitude of the press alternately ignoring and exaggerating, the attempt to stop the progress of the movement by absurdly futile legislation, the final bloody conflict between the new and the old and its inevitable outcome.

In his somewhat more sober volumes Mr. Wells has told us that he means by this coming race the "New Republicans," not physical, but mental, giants; gods, for they have eaten of the tree of

* THE FOOD OF THE GODS. *By H. G. Wells.* New York: Charles Scribner's Sons. $1.50.

knowledge, all powerful because they use the tools given them by science and regulate their lives by its light. How this race of Supermen may be bred and trained he tells in *Mankind in the Making*.†

When a prophet steps off his tripod and condescends to explain in detail how his dream of the future may be realized he comes within range of a battery of criticism in which any of us may fire a gun. In fact, criticism is so much easier than construction that Mr. Wells himself is more successful in his sharp and witty thrusts at the depths of existing institutions than he is at devising workable substitutes. To an American his denunciations of the shams and absurdities of British royalty and aristocracy seem natural and reasonable enough, yet he states the amazing fact

"that while the greater mass of our English-speaking people is living under the profession of democratic Republicanism, there is no party, no sect, no periodical, no teacher, either in Great Britain or America or the colonies, to hint at a proposal to abolish the aristocratic and monarchical elements in the British system. There is no revolutionary spirit over here and very little missionary spirit over there."

The question of eugenics, or the possibility of improving the breed of humanity, is thoroughly discussed, but Mr. Wells gives little encouragement to those who believe that Galton has shown a practical mode of evolution of the race. Even more destructive is his criticism of ideas of the advocates of radical changes in sexual relations and of a greater freedom in discussing such subjects.

In educational matters Mr. Wells runs amuck, slashing right and left, leaving neither old nor new methods without a hit. He is no more severe on the old line classical education than he is on its proposed substitutes, such as

"Heuristic method, whereby at the cost of three or four hundred pounds' worth of apparatus, a total neglect of all other studies and the undivided attention of a teacher of exceptional gifts, an average child might with a peculiar sort of thumby thoroughness learn in the course of ten or twelve years almost as much chemistry as one could get in one of those objectionable shilling textbooks."

Mankind in the Making abounds in interesting practical suggestions, some of them original, some of them promising, but he has failed to study carefully enough existing conditions outside of his own country. Many things he recommends and some he still shrinks from as hopelessly ideal are commonplaces here. Some of his schemes we have tried and found failures. Before he goes into the future he had better catch up with the rest of the world. His books could be made more informing without being less readable and stimulating.

† MANKIND IN THE MAKING. By H. G. Wells. New York: Charles Scribner's Sons. $1.50.

Titian. By Georg Gronau. London: Duckworth & Co. Imported by Charles Scribner's Sons, New York. $2 00 net.

While Dr. Gronau's life of Titian was originally published in German four years ago, the edition which comes to us now in an English translation by Miss Alice M. Todd is practically a new work, for which, we are told, the results of the most recent researches, made since the year 1900, have been utilized. The author says his book is addressed

"not to the narrow circle of art critics, but rather to those in whom a profound impression, created by Titian's art, had awakened the desire to learn something about the production of his works and the life and personality of the artist."

The book is based largely on Crowe and Cavalcaselle's life, tho considerable material unknown to those authors has been drawn upon, and Dr. Gronau's protest that his book is the result of many years of preparatory study and of a perfectly independent criticism of the works of art is valid. Comparatively little is told of "the life and personality of the artist," except as they are disclosed by his works. The bulk of the text is devoted to careful and painstaking, but rather pedantic, descriptions of all the important existing pictures painted by Titian. Controversial points have purposely been touched but lightly in passing. The author was undoubtedly inspired by a genuine love for the great pictures he so minutely describes, but his style is not invigorating. And this is not helped by his translator, whose knowledge of the exact English equivalents of German words and phrases appears to be far from adequate. There are fifty-four illustrations in half-tone,

including many less familiar pictures by Titian at the expense of leaving out those best known by frequent reproduction. Little idea of the artistic beauty of the originals can be gained from these plates, many of which are "muddy" and indistinct. English makers of half-tone plates need to take a few lessons from their American *confrères*. A bibliography, a list of Titian's pictures arranged by the galleries containing them, and a good index add to the convenience of the volume, which presents a goodly amount of trustworthy information in compact form.

The Affair at the Inn. By Kate Douglas Wiggin, Mary Findlater, Jane Helen Findlater and Allan McAulay. New York: Houghton. Mifflin & Co. $1.25.

The "Inn" referred to is on the Dartmoor in Devonshire. When this story opens four persons, predestined by the authors' literary instincts to weave the usual web of love and intrigue, are staying there, all apparently against their wills. The "affair" is between the American girl and a young Scottish baronet. And it does not differ from other affairs of the kind. We all know that any man born in the British Isles will fall in love with an American woman, if she will take the trouble to bring about the "affair," and we all know that in such cases the Britisher resists her charms with all the family pride he can muster. In this case Sir Archibald accents the obtuseness and churlish manners of his race, while Miss Pomeroy casts an equally high light upon the feminine charm and audacity of her countrywomen. The interest of the story depends upon the novel and delightful way in which it is told. A different author is responsible for the development of each character. These, in turn, give their individual version of every incident by which the tale progresses to a matrimonial climax. And the reader sees the facts from as many different angles. It was a daring thing to attempt, but it has been well done.

Tristan and Isolde: A Tragedy. By Louis K. Anspacher. New York: Brentano. $2.00.

It is quite useless to dogmatize about literature. No one has ever succeeded in expressing the essence of a great work of art. A poem may be full of all kinds of apparent faults and flaws, and yet may be a great poem; or, on the contrary, it may be blessed with all kinds of theoretical perfections and still be quite unreadable. But with respect to drama it seems safe to say that, whatever its merits, if it lacks passion it cannot rise to a very high order of tragic excellence. Mr. Anspacher's dramatization of the familiar legend of Tristan and Isolde strikes us as rather feeble constructively. The injured husband is too amiable to be tragically effective; and the catastrophe results, not in fatal consequence of the conduct of the guilty lovers, but as a sort of political side-issue. This is a grave defect in a tragedy—that the *dénouement* should be merely incidental to the main motive. But it is not so grave as the lack of that passion which is almost sufficient of itself to raise ordinary narrative to a pitch of dramatic intensity. Surely the results of tragedy are inconceivable without passion, and in such a case as this they are particularly so. But with the exception of a few smoldering embers in the breast of the writer's Melot, to whom in the incapacity of his King Mark he is obliged to confide the tragic issue of the action, the reader will search the play in vain for passion. The way in which Isolde owns her love for Tristan in the moment of discovery, when she is obliged to confess everything to her husband, is in Mr. Anspacher's best vein, a note of gentle reminiscent regret:

"He sang so sweet
And looked so melancholy large in eye,
I pitied him in pain. He won my love;
And since that time has never lost it. liege.
It seemed his pain had made his lay more sweet,
As I have heard the nightingale doth sing
Pierced by a thorn; and that God pains the hearts
Of poets most who sing the sweetest songs."

Bryan's Dictionary of Painters and Engravers. Vol IV. George C. Williamson, Editor. New York: The Macmillan Co. $6.00 net.

Too much praise can scarcely be given to Mr. Williamson for the manner in which he is editing the new issue of *Bryan's Dictionary of Painters and Engravers*. The fourth volume is now out, car-

rying the alphabetical list of artists through the letter R. When one realizes that more than 350 new biographies have been added to the dictionary, a great number of the old biographies amplified and revised, and more than 1,000 corrections of the old text made, some idea is acquired of the extent and difficulties of the work undertaken. One hardly understands why the editor acknowledges, with apparent pride, that the new biographies of the great British painters, Reynolds, Romney, Raeburn, Rossetti and Russell, are the most important articles in this volume. They are new to-day, but will they be more important to-morrow than the essays on, say, Rubens or Rembrandt? However, the greatest difficulty in revising such a work is that of selection. It is natural to attach undue importance to one's own preferences. In spite of this the general tone of criticism throughout the book is sound, fair and trustworthy. The engravers and miniaturists have received their just proportion of attention. Especially interesting is the article on Petitot, who was miniature painter to Charles I of England and Louis XIV of France. He was the artist who brought the art of enamel painting to complete technical perfection. He painted the portraits of a great number of the celebrities of his time, many of which exquisite little likenesses are now in various museums. The Louvre owns about 60 of them and the South Kensington Museum has a collection of more than 50; some of them are scarcely to be equaled. The many reproductions of artists' paintings are a great aid to the reader, and the admirable lists of their works—especially that of Rembrandt's—are invaluable.

Memoirs of M'lle des Echerolles. Translated from the French by Marie Clothilde Balfour. With portraits. London and New York: John Lane. $1.50.

Could a dull book be written about the thrilling days of the first French Revolution, or about the twenty prophetic years which immediately preceded it, or about the first two or three decades of the nineteenth century? Yes, for did not Talleyrand succeed in so writing his posthumous memoirs dealing with all of these periods that the four big volumes contain no spark of interest, save in the comparatively few pages relating to his boyhood? The reason for the brilliant Talleyrand's failure to raise even a passing gleam of interest in his nominally reminiscent pages is not that he did not have much to tell and could not have told it well, but that he had so much to conceal that he does not venture upon frank opinions or illustrative details, and either as a historian or as a painter of times and manners his memoirs are as dull as they are worthless. The author of the unpretending volume before us, from comparatively slender material and without much literary ability, has produced a book of enduring interest and value. Possessing all the prejudices of her class, with much of its unconscious selfishness toward the lower classes, all of its dense blindness in regard to the qualities of a common human nature alike in the peasant or the noble, and much, too, of the compensating virtues of a high courage and a power of generous self-sacrifice for others (always of her own order, be it understood), M'lle des Echerolles has given us over three hundred closely printed pages, of which the student of the Terror and its sequences would not willingly spare one. Every paragraph bears internal evidence of its author's exact adherence to the truth as she saw it. One such plain narration is of more intrinsic value than countless historical novels, and even more interesting than are the most of these, even altho no glimmer of romance lies hidden in its o'er true tale

Conference on Welfare Work. Held under the auspices of the National Civic Federation, 281 Fourth Ave., New York. 1904. 205 pages, paper.

The new "Welfare Department" of the National Civic Federation is an important field of usefulness entered upon by that organization, and this stenographic report of their first conference is undoubtedly the most practical handbook for all employers who contemplate such work in their establishments. The secretary of the department is Miss Gertrude Beeks, who is known for her re-

markable sucess in introducing improved working conditions in the factories of the McCormick Harvesting Company at Chicago. The preface to this report, by Miss Beeks, is an admirable statement of the objects and methods of welfare work, while the informal discussions, cross questions and answers of the participants open up the practical side of the movement in a way that no other existing publication affords. Those who took part are the leading experts of the United States, and they describe what they are doing in their own establishments. It is interesting to note that the conference decided to substitute the term "Welfare Manager," for that of the ambiguous "Social Secretary," as more accurately describing the positions which they hold and the work they are doing.

Literary Notes

THE letters of Tolstoy denouncing war in general and the Russo-Japanese war in particular, originally printed in the London *Times*, are republished by Ginn & Co., New York, in a ten-cent pamphlet under the title "Bethink Yourselves."

...."The Proceedings of the Chicago Conference for Good City Government" (National Municipal League, Philadelphia) contains some valuable addresses and discussions of modern municipal problems.

....Thomas Y. Crowell & Co., New York, issue in their Gladstone Edition the complete poetical works of Dante Gabriel Rossetti in a well printed and neatly bound volume, with notes by his brother, William M. Rossetti, at the comfortable price of 75 cents.

....A good book for public school libraries is "Children's Gardens," by Louise K. Miller (Appleton, New York), for it gives full practical directions for all kinds of juvenile horticulture, and includes a good deal of related botany and ornithology.

....To all who have to do with either the collection or interpretation of statistics, the "Introduction to the Theory of Mental and Social Measurements," by Prof. Edward L. Thorndike (Science Press, New York, $1.50), will be indispensable. Its discussion of common fallacies of measurement and calculation and of the interpretation of frequency curves is especially thorough. There are many problems for giving practice to the student of psychology or sociology, and a chapter of references for further study.

Pebbles

"SAY, pop, how do parrots talk?" "In pollysyllables, I suppose."—*New York Sun.*

....Will some bright political economist please tell us why the hardest work and the smallest pay usually go together?—*The Social-Democratic Herald, Milwaukee.*

....Senator Alger says there is a good deal of excitement in Europe over our Presidential election. We had been wondering where the excitement was.—*The Washington Post.*

THE ADIRONDACK SPORTSMAN.

He came in a private car. He dismounted at his private station. He followed his private roadway in an automobile. He entered his private, four-story, one-hundred-thousand-dollar camp at the private door. He recuperated from his private camp chest, and then the gamekeeper came in to report the chances of killing game. "The imported moose are in splendid condition," he said, "except one bull. You can shoot him. He has been sick a long time, and it would do no damage to kill him. The imported elk have not been within half a mile of the stand in two weeks. If you will walk a hundred yards from ——" "Out of the question!" exclaimed the sportsman. "Well—er—we have two bears chained in the back end of the lawn. They are very young—quite harmless. It is possible to shoot them from the observatory." "Ah! Good! It will be well to tell my friends I shoot bears from my camp. Couldn't you bring them closer?" "Yes, and in the deer park we have a hundred of the animals scattered over five acres. You could—er—have one of the men kill one from your automobile—" "Certainly—have it done!" "Fishing in the private hatchery is satisfying. The trout weigh three pounds apiece and upward, as I have found by dipping them up carefully with a landing net. They are confined, each one, in a trough four feet long and two wide. There will be no difficulty in fastening them securely to your flies, and then dropping them into the main pond for you to catch." "Good! I need to tell some fishing stories. Send some of the largest fish to the taxidermist's immediately." "Yessir. To-morrow, if you wish, we will go out and see the imported boars—they are in pens. I will see that one is speared and the tushes prepared—" "Oh, well, go ahead and do it; hand me that *Wall Street Review*, and, secretary, have the telegraph operator bring me the report of that last trespass case. I don't see why people select my sixty thousand acres to walk on. There's lots of public highways all around the mountains. We private preservers ought to have the pleasure of seclusion and quiet. Those common people don't appreciate the woods. How can they?"—*Life.*

Editorials

The Two Parties on the Tariff and the Trusts

In considering the attitude of the two great parties toward the tariff and the Trusts, or great corporations, we should have in mind not only platforms and letters of acceptance, but also known tendencies, potent influences, and comparatively recent events in the record of legislation and executive action.

First, as to the tariff, so far as it can be separated from the question of Trust restraint and regulation: Unquestionably, the Democrats would revise the present duties and reduce them if they should gain the power to do so. Their platform, the utterances of Judge Parker and their traditional policy leave no room for doubt about that. But they are not fully in agreement as to the governing principle of revision. Many hold, with Mr. Bryan and the words which he placed in the platform, that "protection is a robbery." Others stand with Judge Parker in favoring a "reasonable and gradual" reduction, or, with ex-Senator Davis, defend incidental protection.

The Republican party "stands pat," as the late Senator Hanna said. There is no promise of revision in its platform or in the utterances of its candidates. The purpose of its dominant forces is to defer revision as long as possible. It is admitted by the Democrats that if Judge Parker should be elected, with a Democratic House, no revision could be made without the consent and aid of a Republican Senate. If a Democratic Senate could be elected, a revision bill might again be Gormanized. But a Republican Senate will have power to bar the way. Still, it might yield in some measure to public opinion, if public opinion should be expressed forcibly by the election of Judge Parker and a working Democratic majority in the House. The Democratic policy with respect to reciprocity deserves support. It resembles that of Mr. McKinley, which the Republicans have rejected.

Second, as to the tariff in association with the Trusts: The Democrats would attempt to reduce sharply those high duties, no longer needed for protection, which enable combinations to extort high prices from our own people, while selling at much lower prices to foreign buyers. If they could control legislation they might be successful, and they might not. The money power is not wholly unknown in the Democratic party. On the other hand, it is held by the Republican leaders, Mr. Roosevelt included, that tariff reduction aimed at Trusts would impose upon the independent competitors of the Trusts a restraint from which they would suffer more severely than the Trusts themselves. We do not think so. Mr. Roosevelt did not a year or two ago. On April 27th last Mr. Littlefield said in the House that it was the policy of the Republican party to cut down the duties which enabled a manufacturer "to sell his product abroad cheaper than at home." He added that he knew of no Republican who took "the other ground."

Where can he now find a prominent member of his party that agrees with him? The Republican argument at present is that the Trusts' duties must not be touched, because a reduction of them would ruin the small competitors of the Trusts, and Secretary Shaw professes to regard as a blessing those high prices which the Trusts, by means of the tariff and with some help from the "small competitors," extort from the general American public.

No one can reasonably expect that the Republican party, if it is successful at the polls in November, will reduce the high duties of which the Trusts greedily and unjustly take advantage. There is nothing in the platform of the party or the recent utterances of its candidates and other representative men to warrant such an expectation. And yet this extortion, made possible by tariff duties which even an imbecile would not call protective, is a great and crying evil, not only because of its injustice and its op-

pressive character, but also for the reason that it effectively promotes the growth of enormous and menacing individual and corporate fortunes. The election of Judge Parker and a Democratic House would at least compel a fruitful discussion of the evil conditions which the Republicans are unwilling to disturb and are now defending.

Third, the restraint of Trust corporations and other combinations, and the enforcement of Anti-Trust laws: Of one method of restraint we have already spoken—a method that would give relief from Trust exactions that the people feel and resent. The justice and expediency of using some other methods that have been suggested are not so manifest. The Republican party points to its suits against the railroad combination in the Northwest, the beef companies, and the grain-carrying roads that gave rebates; also to a modification of the Interstate Commerce law and the provisions for "publicity" in connection with the Department of Commerce's Bureau of Corporations. As for the Northern Securities suit, it now appears that if the Harriman interest should be successful in the pending litigation concerning a distribution of the company's assets, a railroad combination much greater than the one attacked would be created; and that if the Hill claim should be sustained, the original combination of the two parallel and competing roads would virtually continue to exist. Shippers have gained something by the grain road injunctions; the public has not yet detected any relief proceeding from the injunction against the great beef companies. If publicity was the aim of the legislation relating to the Bureau of Corporations, the law has thus far been a failure.

There are other combinations of parallel and competing railroads. Nothing is to be gained by disintegrating them. But consistency required the Government to enforce the law also in these cases or to explain why it ought not to be enforced. There was sufficient evidence of a combination of the anthracite coal railroads, a combination that has increased the price of coal, but the Government declined to make use of it. It also failed to enforce the criminal provisions of the Sherman act in the Northern Securities case; and the Republican Senate ignored a bill passed almost unanimously by the House, and suggested by Attorney-General Knox, for so amending the Anti-Trust law that it could be used against Trusts of manufacturers. That law was not intended to be used against railroads; it was aimed at industrial combinations, which cannot be reached by it. The Republican party makes no promises as to additional legislation.

In their platform the Democrats denounce monopolistic combinations, ask for the punishment of them, demand an additional grant of power for the Interstate Commerce Commission, and insist upon the enforcement of existing civil and criminal statutes against combinations that are unlawful. They also call for new laws withdrawing the privileges of interstate commerce from a combination that monopolizes any branch of production.

Mr. Bryan says all this was nullified by the nomination of Judge Parker. The Judge, while insisting upon restraint by means of tariff revision, relies upon what is called "the common law," rather than upon the statutes, altho no use of the common law can be made by the Federal Government in criminal prosecutions. Moreover, the business interests and associations of the gentlemen to whom the management of the Democratic campaign has been intrusted warrant the conclusion that with their consent no drastic new legislation against combinations would be enacted, and that they would not grieve if existing Anti-Trust laws should not be rigidly enforced. As in the case of the tariff, so with respect to Trusts, a Republican Senate that shelved the bill passed at Mr. Knox's suggestion would probably decline to assist a Democratic House in applying restraint to industrial combinations not touched by existing statutes.

Such evils as exist in the railway world cannot be removed by a strict and impartial enforcement of the Sherman act, which would not prevent that consolidation which appears to be inevitable. The remedy is to be found in supervision and regulation by a Commission of superior ability and broad powers. Whether the Sherman act should or can be so

amended that it will be available for use against industrial combinations is a question not easily answered. Mr. Knox thought it could be so amended. Some hold that the Federal Government now has sufficient power to regulate and restrain such organizations; others are convinced that a Constitutional Amendment is required, but do not think that the States would consent to support it. Neither party grasps this question with firmness, absolute sincerity and wisdom. It is a problem of great importance, and we are still of the opinion that a solution of it should be hastened by the labors of an official Commission of patriotic and competent citizens.

The Minor Political Parties

MANY reflections are awakened by an array of articles in this number of THE INDEPENDENT on the aims of the minor political organizations, each putting forward a Presidential candidate, each confident that the salvation of America depends upon the triumph of one particular set of principles, each regarding all the others as blind or dangerous, and all agreeing that the great Republican and Democratic parties are equally corrupt and inimical to the national welfare. Yet not one of these parties can expect to cast a vote in the electoral college. In 1900 the popular vote for Wooley, Prohibitionist candidate, was 209,936; for Debs, Social Democratic candidate, 85,971, and for Malloney, Socialistic Labor candidate, 49,699. These insignificant totals stood over against the 6,358,789 votes cast for Bryan, and the 7,208,244 votes cast for McKinley.

We hope that each of these minor Presidential candidates will read the other fellows' articles, and we should like to believe that they all have a sense of humor; for, if they have, they will enjoy the diversion. The spectacle of the National Liberty party "confronting" the people of the United States is one that no voter with a twinkle in his eye could wish to miss. The demonstration that the churches, by casting a solid vote—under a unit rule, we presume—could elect the Prohibitionist candidate awakens visions of bishops, elders and circuit preachers impounding the sable bird of sin, after solemnly sprinkling salt on its tail. Mr. Debs's declaration that the Social Democratic party "does not want a vote that is not intelligently cast" suggests a possible explanation of its failure to poll more than 85,971 votes when it has, as Mr. Debs assures us, eight million supporters scattered about the world, "and is therefore, in point of numbers, the greatest political organization on earth."

Besides things amusing, these excellent gentlemen can find in one another's productions occasions for wonder how men of Presidential dimensions can in all soberness make so many assertions that have neither the quality of certitude nor that of seductive plausibility. Thus, for example, the Rev. Dr. Swallow advances the proposition that "taxation always implies protection." Dr. Swallow should deglutite some American history. At one memorable period, not to mention other instances, the circulation of State banks was subjected to taxation, not for the purpose of protecting it, but with the deliberate and avowed intent to destroy it, and the destruction was successfully achieved.

All in all, however, these articles are models of frankness, at times even approaching indency of mental exposure, as when Mr. Corregan acknowledges that the workingmen of the Socialistic Labor party "seek control of the political powers in order to administer the affairs of the Government in the interest of their class." We like Mr. Corregan's truthfulness, but we deplore the fact that he discloses; for we should like to see the workingmen and their candidate set an example of high thinking at a time when a President of the United States, momentarily forgetting that he is the official head of the nation and the representative of a whole people, has allowed himself to speak of half of that people as "our opponents."

The minor political parties, with all their curious narrowness of vision, are an important factor in the political life of a democratic people. They stand for sincerity and moral earnestness. They are parties of initiative and always represent a real interest or a real principle. It is their function to awaken and to agitate. They never win elections, but from time to time they compel one of the major

parties to take up the fight for a great cause. In fact, it is hardly an exaggeration to say that in a democracy the minor political parties are the organs of initiative of public opinion and public conscience. They compel the people to face questions that the politicians of the great parties would prefer to dodge. They help to keep alive and to intensify that intellectual and moral fighting which is the one sure salvation of mankind from the woes of physical fighting at the end. We should be sorry to see the American people become so far the victims of obsession by one idea as to elect a candidate of a minor party in ordinary times, or to see them again face to face with such a moral crisis as the slavery issue was when a minor party suddenly became the great Republican party. But at all times we are glad to see the minor parties full of life and determination, as searchers of the mind and soul of the people.

The Dove-Cote

Some weeks ago Mrs. Commander, as the result of large inquiry, reported to our readers what she found that people generally hereabout think as to the desirability of large or small families. She declared that most married people want small families, one or two children or none. This week she reports what she has found to be the reasons generally given for unwillingness to have many children. The substance of it is that they are controlled by the thought of comfort and expense. It costs more suffering, toil and money than they can afford to bring up more than one or two children. In simple, pioneer days each child was a profit and wealth. Children became earners when young; now they must be educated, and they are a costly burden, which exhausts instead of replenishing the larder and the wardrobe. Therefore one or two is enough.

This reason has some force, but it ought not to be conclusive; and this we will make so plain that the wayfaring woman, tho a college graduate, need not err therein.

We do not suppose that we write for people who consider solely themselves, who think only of their own ease and pleasure. We suppose that we have to do with people who consider humanity, who hold the old rule that "no man liveth for himself." If one wants simply ease, comfort, takes no joy in tasks for others, no responsibility for the present and future of mankind, then the reason given is conclusive for him or her. They want what gives them leisure for pleasure, and little weight of responsibility. They may find it agreeable to have a pretty child or two grow up in the house for companionship. And it is very easy to make a virtue of training a single one well, and giving it every luxury which they wish for themselves, rather than to provide more sparingly for half a dozen and themselves. One fine child, they say, well educated, is better than a dozen stinted and stunted. That is their pretense of virtue.

But let us look a little wider. We will take ten thousand people, a fair sample of the whole population. Two thousand of them are superior; two thousand are inferior; six thousand are commonplace. The superior two thousand have the enterprise, the intelligence, the comfort, the influence. The inferior two thousand are slow witted, inefficient, thriftless, poor. The six thousand are of the middle average sort, who just hold their own, without ambition to rise, but useful to keep the world's work done, under the guidance of the superior two thousand, whose example or direction they follow. This is about the condition the world is in, altho we may have made the extremes too large.

Now what children will they have? We are told that the superior class are wanting very few children, or none at all; that the middle class are of the same mind, following their example; and that it is the inferior class, with no forethought, heedless and careless, that have large families. Where will that bring us in the course of two or three generations?

Of the 2,000 superior men, women and children, as many as 400 will die young or remain unmarried. The remaining 1,600 are married, or, we may presume, will marry. They will have, we will suppose, under the defended rule of comfort and economy, some two children, some one, some none. There are

many of the last class. But let us suppose that they have an average not of one child, but one and a half to a family. That gives 1,200 to take the place of the superior 2,000 in the next generation. But these are all children, and one-third of them will die before they are marriageable. The 800 left will have 600 children for the next generation, of whom 400 will live to have 300 children. In the same way the 6,000 common average people will lose somewhat more children by death, and will have, under the supposed economy, about the same number of marriages and births. But making no allowance for increased deaths, and supposing them equally unwilling to rear children, the 6,000 will be replaced in the next generation by 3,600, which the next generation will reduce to 1,800, and the next to 900. The two classes, the superior and the ordinary, will in the fourth generation count 1,200 souls.

Now, let us see what will become of the 2,000 inferior, thriftless, impoverished, and many of them vicious. We are told that they have no forethought, that they undertake little responsibility for their children, and that the slums are full of children that grow up like weeds, while in the rich resident sections they are scarce, and none welcomed in the apartment houses. These inferior children are less likely to survive, but half of them will live. They are not so prudent as to wait till they are thirty or forty before they marry. They will multiply like the Jukeses. Some families have four or five children, others eight or ten, and they will make their own living by the time they are able to pick up firewood and sell papers. We assumed that in the other classes 400 out of 2,000 would die young or not marry. In this class more of the children will die young, fewer will prudently remain unmarried, or wait till they are thirty or forty years old. On account of deaths we will allow that 500 do not marry. That leaves 1,500 who marry, and it will be a moderate allowance to suppose that three to a family will live to grow up. That makes the following generation consist of 2,250 marriageable persons. The next generation will consist of 3,375, and the next of 5,061. We have then the result, under this rule of economy and comfort, of this community of 10,000 souls, the superior and the average have fallen from 8,000 to 1,200 in four generations; while the incompetent, brainless and vicious have in the same time increased from 2,000 to 5,061. In the sixth generation the superior and the ordinary will not be worth counting, and the inferior and worthless will wholly occupy the land. It is not strange that when luxury developed in the time of Augustus, and children of the good families were few, the Roman Senate passed laws *super jugandis*, and that, when the *lex marita* failed, in a very few generations Rome fell in the violence and corruption of its most degraded populace, its decent citizens vanishing away,

"*vitio parentum Rara juventus.*"

Our figures are not exact, but the fact is sure. If the decent and best citizens will not maintain and increase their numbers, the worthless will supplant them. Heredity, physical and social, will tell. If you cease to sow the wheat, the tares will fill the ground, and who will be responsible?

But my fine gentleman and my fine lady say, What has posterity done for us, and what do we care for posterity? Why should we sacrifice for children's children, for generations we shall never see? After us the deluge! That is fit reason for the "swine of Epecuras's herd," but not for men and women who look above the trough, and who have a love for their country and a passion for humanity. Such will find higher pleasure in greater service and sacrifice.

The Fate of Old Men

MR. SPENCER'S generalization that industrialism and militarism create radically different types of society, was on the whole profoundly true, but it was not true in every particular. While militarism means despotism, and industrialism, by contrast, means a great deal of liberty, there are phases of industrialism that savor of unscrupulous power. Nor is it true that business men are always of a higher moral type than military men. War and business have their own respective cruelties, for each in its own way is remorseless. Of modern business, at any rate, there are thousands of victims who

must say in their hearts, as bitterly as Sherman said of war, " Business is hell."

The cruelties of war the nations accept as inevitable. Perhaps if we could take calmly philosophic views we should accept the decrees of corporation magnates as inevitable. Be that as it may, it is idle to deny the ruthlessness with which the business of great industrial enterprises is nowadays conducted. Not merely is the weaker competitor driven to the wall, as the military foe is driven to his last stand; but also, what is quite as significant, the employees, on whose faithfulness success depends, are as unsparingly used, until they are used up, as regiments of soldiers are used by their commanders.

Even in the fate that overtakes the employee who has served without death or injury until the years of mature manhood are passed, the modern industrial system is rapidly becoming like a military organization. While pensions are given to the disabled and to the families of the slain in battle, the retired soldier, still physically sound, is left to get his living as best he may, or to be looked after by his friends. The great industrial corporations in like manner are everywhere drawing the age line, and thousands of men not yet old are being turned adrift, unpensioned, to earn their bread if they can by miscellaneous and uncertain occupations, or to become, while still in the full possession of their powers, a dependent class. The recent orders of the Pennsylvania Railroad and of the Carnegie Steel Company are not different in kind from the present practice of corporations generally. They are only somewhat more stringent and thorough-going. Within the last fortnight more than 1,000 employees of the Pennsylvania system have been discharged under the general order that no employee of the company who was hired after he reached the age of 35 is to be retained. In the Carnegie works the age limit for skilled workers has been put at 35 years in some departments and at 40 in others.

There are various ways in which a general practice of pushing mature men out of responsible industrial positions may work itself out in new adjustments. It is impossible to predict which one is the more likely to prevail. The experiment of conducting all business with the services of young men only we regard as of doubtful economic expediency. We believe that in the long run it is likely to result in losses that will start a reaction. So long as the American public is so madly in a hurry that it cares more about the speed than the quality of life, the hasty work of half-trained young men may answer all productive purposes; but when thoroughness, soundness, distinction of quality, come into demand, if ever they do, it will be found that the wisdom born of experience is quite as essential as the energy of youth. We venture to say that if the American people cared half as much about security of life and limb as they care about the frequency and speed of trains, the railroad companies would not be in the business of discharging all men taken into service after 35 years of age.

If, however, the conditions prove to be such that corporations can make money by substituting youth for experience, a public demand will certainly be felt for a general pension scheme. That economy of production or operation achieved by substituting young men for mature employees will be sufficient to establish an adequate pension fund out of corporate earnings, and that such a fund will, in fact, be established and distributed by the corporations themselves, is unlikely. The alternative is a general service pension in the domain of industry, as in that of military activity, created and administered by the state. Should the public come to demand such a provision for old age the day of socialism would be not far off. By their policy of throwing mature men out of employment the corporations are doing more than all the agitators of five continents could do to create a general popular willingness to try the socialistic experiment.

Agriculture in Russia

The real key to the Russian position to-day is the decline of agriculture. The emancipation of the serfs was not an unmixed blessing, for it left those who must till the land absolutely ignorant of scientific methods, and yet holding on the average only about five acres per head. With the wasteful methods adopted by the peasantry, and their per-

sistent repetition of the same crop for long series of years, the earth has become exhausted to such a degree that famines are of almost annual occurrence. Meanwhile taxation has increased at a destructive ratio. The number of cattle and horses has decreased so greatly that fertilizers are lacking and animal power for cultivation. We have left, then, a vast population of from thirty to forty millions of starving farmers, and the condition of affairs growing worse every year. When the peasant fails altogether as a land owner his wages as a day laborer average ten cents per day. Even at this wage his condition is not so utterly hopeless as that of the employer.

What is called "The Black Earth Belt" is the very heart of Russia, and it has been the great harvest field of the Empire. It consists of about six hundred and twenty-five thousand square miles of naturally rich agricultural lands, holding about forty-five millions of inhabitants—that is, two-fifths of the whole population of Russia. Not long ago, and within the memory of some now living, this was the most fertile part of Europe. The soil is rich and black, very much like that of our own prairie lands and the delta of the Mississippi. It is land that, with proper culture, could abundantly nourish its present population and export millions of bushels of grain. As a fact, this agricultural heart, or core, of Russia has been exhausted. Crop failures follow each other in constant succession. M. De Witte is unwilling to allow this. In his reports the successive famines are attributed to accidental conditions, such as too much rain, or too little, or very severe and untimely frosts. The best authorities, however, such as Engelmann and Golovine, tell us that there is no escaping the fact that this famous black earth belt is played out; that it can no longer be relied upon as the harvest field of Russia and a source of revenue. It has for many years received almost no manure, and the humus has been gradually ground out of its possible power to add to the fertility. Only one crop can be seen for over hundreds of miles, and that is wheat. It is not simply the farmer who does this, but the persistent urgency of authorities behind them.

There has been a falling off in the average yield within the last twenty years of thirty per cent., and in some cases, as barley and spring wheat, it is forty per cent. It is undoubtedly true that with this process of soil exhaustion we have to count in the consequences of ill-advised forestry. The wholesale devastation of the vast forests of Southern Russia has at last wakened up the Government to very positive steps. The remaining forests are placed under Governmental control, and steps will be taken to recover somewhat the losses of the last twenty years.

If any explanation were necessary to show why Russia to-day is at a disadvantage in comparison with a young, virile and industrious people, it is to be found in these agricultural conditions. The consequences of reckless farming came to a climax with the opening of the century. The richest district in Russia, lying along the Volga, became the center of a condition of affairs not exceeded in its horrors by the famine-struck districts of India. The people have been so absolutely without food that during the winters they have undertaken to establish a system of hibernating, like some animals—hiding themselves in their huts, where they lie in a stupor, moving as little as possible either by night or by day. Remember that this condition of affairs applies to over one-third of the population of Russia. Of course, the remedy lies in the application of modern science to cultivation. The peasant, a freed serf of yesterday, is utterly unable to adapt himself to the requirements essential, even if he had any knowledge of what they are. He is at best a half-hearted laborer, and burdened down by religious holidays. His teachers are not to be found. Thoroughness is something that he knows nothing about. The remedy is not only a change in methods of cultivation, but a change in the character of the cultivator. Witte says, in a memorial to the Czar, that it is impossible to induce the Russian farmer to move as an individual. He feels himself to be part of a mass, and as such he moves only with the crowd. Formerly the crowd obeyed the orders of a noble or master; now they obey a sort of commune. It follows that the Russian makes a good soldier, but not a good farmer.

The present war is bringing these

agrarian conditions to the front. Europe is making a new study of Russia. Instead of being a force to be dreaded, it is found that Russia is in reality a factor of little import on the Continent. Not only has "The Great Black Belt" grown poorer, but all the rest of Russia is undergoing the same decadence. There are said to be hundreds of farms in Southern Russia without a cow or a horse. The proprietors are compelled to do the work of cattle in the way of plowing their own acres. A large number of farmers appeal to the Government for aid in their annual sowing. Novikoff speaks of "vast districts where there is no communication with markets; fat soil which does not return what is put into it; half-starved animals on arid meadows; pious farmers with one hundred and fifty holidays in a year; an all-pervading sentiment of nameless terror"—and that is agricultural Russia.

Ministers in Mufti

THE propriety of clerical dress is now being somewhat discussed in the religious press of England, or, rather, the propriety of putting it off and dressing in what the sticklers for the clerical style call *mufti.*

We suppose *mufti* is the term properly applied to the ordinary citizens' clothing when worn by officials and army officers in India in place of their regular uniform; and we presume that our own American clergy, so few of whom ever wear any other than ordinary citizens' clothes, have never suspected that they were going about disguised in *mufti.*

It is really a quite late development of Protestantism to discard special clerical garments and dress like other citizens. Even as late as Carlyle's "Sartor Resartus" pretty nearly every clergyman of every name wore a tight single-breasted long coat, while the paintings of a century or more ago give us bands as well. In an old picture a clergyman is as carefully defined by his clothes as a soldier or a judge. But at present only one or two Protestant denominations expect or desire their clergy to wear distinctive clothing, a straight coat and a high black waistcoat, chiefly those that like to retain the use of the term *priest* for their clergy; altho sporadically we find the same habit in some other denominations, among those who think it adds dignity in adding distinction.

It is not strange that the special garment did not depart with the theology which was discarded at the Reformation. It was easy to give up the Pope, but not easy to give up the special priestly power. With the theory of special spiritual grace and authority may properly go a special garb. The garb declares and assumes the peculiar spiritual claims. But when, in the development of religious as well as political democracy, men began to declare that they were born equal, and with equal rights of approach to God, and to understand what this new doctrine means, they could not continue to carry a costume which implies superior influence in Heaven. Those would feel the propriety and necessity of a priestly garb who retained the priestly doctrine. If a man is different from other men, and has a different mediatorial relation to God, a special relation which he claims and wishes others to recognize and grant, it is as natural to express it in his uniform as it is for a military officer to wear sash and epaulets.

The discussion now going on in the English papers assumes that a clergyman will, of course, wear clerical costumes when "on duty," but the question is as to whether he may dress like any other gentleman when "off duty." The very terms have a military ring. Archbishop Whately once met one of his clergy in lay costume and sharply rebuked him, telling him that in thus giving up his distinctive dress he showed himself ashamed of his holy office. The clergyman denied that such was his motive, and reminded his Archbishop that officers in the army when "off duty" assumed civilian's dress. "Quite true," was the reply; "but a clergyman should remember that he is never off duty." The Archbishop was wrong. A clergyman is never off duty as a Christian, but he is as a cleric; otherwise he could never put on pajamas or a bathrobe. There have been decisions of the later Councils which forbade the clergy to wear any but a professional dress. The New Testament makes no suggestion on the subject, and is thus in marked contrast to the Jewish Law,

which very carefully prescribed the priestly vestments. In the Epistles all Christians are designated as priests, and not simply the Apostles or other preachers of the Word. No one imagines that our Lord, or Peter, or Paul, or Stephen wore any other than the usual garments of their day. Our Lord's every-day garments the soldiers took for themselves. Paul's "cloak" which he "left at Troas" was the usual outer garment of his time. But with more form and ceremony, and especially more priestly claims, the Christian priest came to wear a distinctive dress, altho we do not find it canonically required before the time of a local Council A. D. 691, when it was thus laid down:

"No cleric is to wear an unprofessional dress, whether in the city or on a journey, but must use the robes prescribed for those enrolled among the clergy, under pain of excommunication for a week."

After this time the rule became more strict, and the Council of London, held in 1268, ordained:

"To put off the clerical dress is a very grave and wanton abuse, by which God is mocked, the honor of the Church obscured, the dignity of the clerical order degraded. Christ, when his soldiers wear other uniforms, is deserted; the honor and dignity of the Church is stained when the beholder cannot distinguish a cleric from a laic at a glance, and so the priest becomes a scandal, and despised by all who are truly faithful."

We make no objection to the clerical dress for those who hold the theory that the clergyman is a priest and not simply a minister. For such it is appropriate and even beautiful. It befits the dignity of the calling. But we recognize the fact that the sense of the equal brotherhood of believers has among those not of the Roman communion generally made the distinctive clerical dress seem presuming and out of place. In most of our religious bodies a clergyman will not be recognized except by that general bearing which any business gives a man. Nor have the clergy thereby lost the respect of their people.

The Boston Peace Congress

The thirteenth annual conference of the International Peace Congress at Boston followed close upon the twelfth session of the Interparliamentary Union held at St. Louis, a full account of whose memorable resolution appeared in our issue of last week. The most noteworthy event of the Boston Conference was its hearty indorsement of this resolution of the Interparliamentary Union. Indeed, the carrying out of this resolution would be the harvest time of the various peace organizations. Heretofore they have had to protest against what the Governments are doing. This time they are forced for the most part to applaud, for the President of the United States had officially announced in replying to the Interparliamentary Union that the United States is now taking steps to open negotiations with every nation for a treaty of arbitration, and that, at an early day, he would invite all nations to send delegates to a Conference for convenient negotiation of such treaties between all nations and for considering the advisability of creating a Permanent Parliament of Nations to convene periodically for discussion of affairs of common concern to all nations. What more could the Peace Conference reasonably ask, except that the nations respond to the call and do the things requested by the resolution of St. Louis? The resolution indorsing the action of the Interparliamentary Union and commending the President for his unqualified and forceful action thereon was so worded as to record the fact that the United States was requested to propose to the other nations the establishment of a Permanent Congress of Nations by a joint resolution of both houses of the Massachusetts Legislature, adopted unanimously in February, 1902, and not only approved, but indorsed, by a special letter of commendation by the Governor of Massachusetts. It was fitting that this fact be recorded, for Massachusetts was the first State officially to indorse this idea, which by the President's action has become the paramount problem in the practical politics of the world. The resolution of St. Louis in changing the peace people from anti's to pro's reminds us of the words of the King: "Now is the winter of our discontent made glorious summer by this son of York." Indeed, this demand for inter-

national political organization with a view to substituting judicial decisions, according to recognized principles of law, for war between nations is the political sun of the twentieth century. A great step has been taken. And the interval between now and the convening of the Conference to be called by the President is a most critical period in political history. During this interval the thought of the world is to be formed in regard to what can and should issue out of that Conference. And what will issue out of it depends in a great measure upon the attitude taken by the press in all its various agencies, daily, weekly, monthly; also upon the continued work of peace organizations, which can create sentiment to carry this great movement to a successful issue. This resolution is really a call to action upon every peace organization in the world; and they will not fail to continue with renewed zeal the work they have so persistently done in the dark and discouraging days. The Boston Peace Congress has taken its stand. The American Bar Association, at its session at St. Louis, has done the same. And in America it may be safely predicted that the leading agencies for forming public opinion will unite and co-operate for wide publication of facts and opinions which will insure the most advanced action by the Conference when it convenes.

Bishop Tuttle and Mr. Olney

We have authority for saying that old men are not always wise, and wise old men sometimes, in their youthful urgency, have a relapse into folly. Such was the utterance of the venerable Bishop Tuttle, of Minnesota, when, in a session of the Episcopal Convention in Boston, held in behalf of missions, he called attention to the fact that the church of which Judge Parker is an officer, and of which his son-in-law is rector, had made during the year no contribution for missions. It was an amazing slip, and the Bishop immediately apologized most humbly for it. There may be good reasons why no annual contribution from a church may get into the records of a year. The collection may have come late in the year and there may have been delay in sending it in, or a dozen other good reasons may have caused the apparent neglect, even with no lack of interest in the cause. Mr. Hall, the rector, however, has since shown that, altho the church is only a mission church, its contributions to missions during the year referred to exceeded $300. It was not in quite so inappropriate a place—for it was in Faneuil Hall—but at a reception to the Archbishop of Canterbury, attended by the members of the convention and the citizens, that ex-Secretary of State Olney made an address in which, with evident reference to political affairs, he said, among other things:

> "Whatever be the cause—whether rightly or wrongly—whether necessarily or unnecessarily—the war bacillus has got into the American blood. Under its influence we are changing from a pacific people to a people under arms; are assuming to rival in fighting ability and readiness the great fighting States of Europe, and are bringing upon ourselves and our posterity the onerous taxation and all the other miseries inseparable from great and immediately effective military strength."

That "war bacillus" can hardly be said to be very active. Think of it! We have in this country, Alaska, Porto Rico, Panama and the Philippines only 69,000 soldiers, a smaller proportion of our population than we had before the Civil War. It is true that we have a comfortable navy, but in this we have no more than kept pace with other nations, and no one thinks of our navy, except for defense. The worst war-scare we have had since 1861 was when Secretary Olney faced England with our diminutive army and inadequate navy. We hold he did right, but he is not the man, with the record of his famous article in *The Atlantic Monthly* in favor of American activity in international affairs, to charge the people with harboring the "bacillus."

Ecclesiastical Vegetarianism

When we published some weeks ago an editorial in which we spoke of a feeling in the Catholic Church abroad against celibacy of the clergy, we did not expect to see it actually discussed

in our American Catholic papers; but here is the organ of the Church in the archdiocese of Cincinnati introducing a "well written article" by Dr. Joseph Müller, editor of a progressive Catholic foreign magazine, *Renaissance,* an article which is quoted at length with approval as to the manner of "confessions," and then our Catholic contemporary proceeds to summarize what Dr. Müller has to say on celibacy, remarking nothing more severe than that his points "are not along the beaten track, and to many must sound harsh." We quote:

"Dr. Müller pleads for the introduction of the Greek discipline, which permits the marriage of priests, who, he thinks ought to 'increase the number of God's faithful people' in the time of early manhood, and afterward might be admitted to the celibate life. 'If we must have ascetical heroism in all who receive the Sacrament of Holy Orders,' says he, 'let them be obligated to vegetarianism and total abstinence, whereby many a convivial celibate would be greatly benefited hygienically.'"

Ex-Premier Meline is not the kind of French statesman who would be likely to be in the Combes Cabinet. He is the leader of the Clericals and a Moderate Republican, which does not mean a very positive republican, but one who could be reconciled to an Orleanist *régime.* In a Clerical French paper he indulges in a strain of wo over the advance of America in the world's trade. Our favor to Japan troubles him, and he sees us a giant with mighty jaws which, after devouring a good part of Europe's trade, is now preparing to deprive her of her trade with the yellow race, the most important in the world. We are not so sure that the Pacific is to become an American lake, but the conditions certainly favor it if we are as ready to take advantage of our chances as men of his pessimistic style are ready to believe.

There are jokes and jokes, some amusing and others very serious. Congressman Heflin, of Alabama, who is stumping his district for re-election, made a speech at Tuskegee the other day in which he said:

"There they sat, Roosevelt and Booker, and if some Cudgeon or one of his kind had thrown a bomb under the table no great harm would have been done the country.

"If Booker Washington takes a hand in this thing, it will be one time I will ask him to step out. I will ask him to hands off, and you know we have a way of influencing down here."

Now he interprets it, and explains that what he said about the President was a joke, but that what he said about Booker Washington was serious. If so it is serious enough, a threat to kill him if he took any interest in the political situation. And murder is supposed to be good politics in that neighborhood.

Some of the Catholic papers are very angry at the likelihood that the money paid for the ecclesiastical lands in the Philippines should be paid to the monastic orders to be taken to Spain, instead of being used for Church purposes in the Islands. They declare that if the churches are thus left penniless American Catholics must not be expected to make any collections to help them. That may be a natural resentment, but is it in accordance with the treatment our Lord laid down for the man who fell among thieves? Do they not know that if the priest and Levite pass by on the other side, the Samaritan will take the wounded man to the inn and take him in?

Our own contribution to the cause of spelling reform has been less than we would like, but yet something, in the shortening of a few words by the omission of needless letters. Something in a similar line has been provided by the Mergenthaler Linotype Company in a contraction of *d* and *h* for use in the sonant *th*, as in *the, this*. We wish it might be used to represent a distinct and frequent sound. The use of this ligature will be required for very few very common words, principally ᵈhe, ᵈhat, wiᵈh, but about four per cent. of the letters on an ordinary page. Our own readers make no objection to our simplified spellings, and seem hardly to notice them.

In illustration of the way New England is becoming New Ireland we mentioned the other day the appointment of an Irish Catholic to be Superintendent of Public Schools in Boston. Another case of note is in the city of Lynn, where the four heaviest taxpayers are of the same race and faith, and bear the names of Magrane, Lemos, Heffernan and Phelan.

Insurance

National Insurance Supervision

THE editor of *Assurance* in his last issue calls renewed attention to the question of the substitution of National for State Supervision. L. G. Fouse, President of the Fidelity Mutual Life Insurance Company of Philadelphia, has, it seems, become a recent convert to the doctrine of National Supervision, and in a paper on the subject, contributed to the *Annals of the American Academy of Political and Social Science,* gives reasons for the faith that is in him.

The growing desire for National Supervision arises because of inconveniences, hardships, impositions and scandals that too often spring out of State Supervision. To accomplish the inauguration of a National in place of a State Supervision, no matter how desirable it might or might not be, would not be easy. The existing relations between the States and the Federal Government are peculiar, not to say intricate, so that the difficulties to be overcome seem to be insuperable. Mr. Fouse contemplates with equanimity a dual system under which the State rights would be subordinated to the new National system. This duality of supervision scarcely seems desirable, however, even if the several States could be brought to the point of acquiescence in the playing of second fiddle in a National concert performance.

A writer in *The Insurance World* says:

"The question of whether Congress has power under the Constitution to take control of insurance companies doing an interstate business away from the States and vest it in the general Government is one on which there are wide differences of opinion. Mr. Garfield, the Commissioner of Corporations, has given it a great deal of consideration without as yet coming to any definite conclusion. The Supreme Court of the United States has passed upon many cases involving the question of the power of the States to regulate the business of insurance within their borders. In every case it has been decided that such power resided in the States, and that insurance was not interstate commerce. In no case, however, has the Supreme Court held explicitly that Congress did not have the power under the Constitution to regulate interstate insurance, and as the court has frequently decided that in the absence of Federal legislation over matters within the power of Congress the States had the power to legislate; it has been contended that if Congress should pass an act for the exclusive regulation by the general Government of interstate insurance the court would not find anything in its earlier decisions that would interfere with holding such an act constitutional."

For many reasons National Supervision would be exceedingly desirable, just as a National railroad law and a National law of divorce would be desirable. But if, by hook or crook, it could be established that insurance is commerce, it would be interesting to know what would become of compacts and rating bureaus? The Anti-Trust Law might become a powerful factor in the conduct of the business of insurance, as now carried on, and the ills we have would be crowded out and replaced by others we as yet know not of. This will at least have a tendency to check the well advanced, and in many respects desirable, movement in favor of National Supervision. The whole matter seems to merit the most careful consideration on the part of those vitally concerned.

THE causes of fires in Boston during the months of May, June and July as given in the reports on the subject by Superintendent Samuel Abbott, Jr., of the Boston Protective Department, are as follows:

Awning fire	1
Boiling over of fat, syrup, tar and wax	13
Brush fires	3
Bonfires	11
Candles	6
Chimney fires	17
Electric light wires	8
Fireworks	21
Friction of machinery	1
Fumigating	1
Gas escaping	1
Gas jets	12
Gasoline stove	1
Hot ashes in wooden receptacles	7
Kerosene oil lamps	17
Kerosene oil stoves	11
Lightning	4
Lime slacking	1
Matches	71
Overheated boilers	3
Overheated furnaces and ovens	6
Rubbish fires	5
Sparks	26
Smoking	19
Spontaneous combustion	8
Stoves	9
Vapor of naphtha, gasoline, etc	11
Total	294

Financial

Mr. Loree's Resignation

Less than a year ago L. F. Loree was induced to give up the presidency of the Baltimore & Ohio Railroad Company and to become the supreme executive head of the Rock Island system. He now resigns this office, owing, it is understood, to disapproval of his policy by the Moore brothers, who virtually control the great system and who entered the railroad business after an interesting and profitable connection with the Match Trust and Tin Plate Trust. It is said that Mr. Loree, a graduate of the Pennsylvania road, introduced Eastern methods, which the controlling owners of the property believe to be unsuited for Western conditions. His withdrawal directs attention to the pecuniary reward which in these days a railway manager of exceptional and recognized ability may hope to gain in the United States. The Rock Island paid Mr. Loree a cash bonus of $500,000 in addition to a salary of $75,000, which he was to receive for five years, even if he should leave the company's service.

Reciprocity with Canada

At the Massachusetts Republican Convention last week the permanent chairman, Attorney-General Moody, argued at some length in favor of a treaty of reciprocity with Canada, and virtually announced the purpose of our Government to begin negotiations for such an agreement:

"We have made a treaty with Cuba which has proved an advantage to both countries and has sacrificed no American interest. May we not hope to do the same with our Northern neighbor? I think I may safely assure you that in the near future this Government will again invite Canada to consider in a friendly spirit our trade relations."

Reciprocity with Canada is a live issue in Massachusetts, and the platform adopted calls for the negotiation of treaties with the Dominion and Newfoundland. It is quite evident, however, that the overtures must be made by the United States. Public opinion in Canada is not inclined to favor further negotiations. Sir Howard Vincent, who recently spent four weeks in Canada, said in New York last week that the unvarying sentiment of the Canadian manufacturers was that to this country there should be no concession that would increase our exports to the Dominion. A report from this British protectionist may not represent all shades of Canadian opinion, but there seems to be no general desire in Canada for closer trade relations with us. Reciprocity with the United States does not appear to be an issue in the Canadian campaign which is to end on November 3d with a general election.

At the recent Chicago & Alton annual meeting it was shown that the road is now controlled by Rock Island interests.

....The gold output of Northern Alaska for this year is estimated as follows: Klondike, $11,000,000; Nome, $10,000,000; Tanana, $2,000,000; other districts, $3,000,000.

....An advance of 5 per cent. in the price of diamonds was made last week by the De Beers selling syndicate, or Trust, which controls 93 per cent. of the world's output. This follows several similar advances which have increased the price by 30 or 40 per cent. in the last three years.

....A British official report, recently issued, states as follows the output of coal in the principal producing countries in 1903: United States, 320,983,000 tons; United Kingdom, 230,334,000; Germany, 116,638,000; France, 34,318,000; Belgium, 23,912,000. During 1902 and 1903 the price was falling in these European countries, and rising here.

....Dividends announced:

Am. Chicle Co., Common, 1 per cent., payable October 20th.

Am. Car & Foundry Co., Preferred, 1¼ per cent., payable November 1st.

U. S. Rubber Co., Preferred, 1½ per cent., payable December 15th.

Rogers Locomotive Works, Preferred, 1½ per cent., quarterly, payable November 1st.

Rogers Locomotive Works, Common, 1½ per cent., payable November 1st.

The Independent

Vol. LVII NEW YORK, THURSDAY, OCTOBER 20, 1904 No. 2916

Survey of the World

Judge Parker's Speech on the Philippines

Addressing a visiting delegation at his home in Esopus last Saturday, Judge Parker spoke at length concerning the Philippines. Quoting the declaration of the national platform and his own remark that our "responsibility will be best subserved by preparing the islanders as rapidly as possible for self-government and giving to them the assurances that it will come as soon as they are reasonably prepared for it," he then referred to Secretary Taft's argument against making any promise, and continued as follows:

"Here we have the issue clearly defined. The Republican party stands for the subjugation of defenseless foreign peoples. Democracy stands for freedom. We relieved Spain of this thorn in her flesh, the Philippines, to plunge it into our own. We paid, and are paying, enormously for the privilege of performing the operation. Spain had been trying to conquer the islands since the early decades of the sixteenth century. She had never quite succeeded. That is not surprising. Every true American would despise a man who would not fight to the last gasp for the land of his fireside and the birthplace of his babes. Did not our illustrious ancestors in the Revolution do so?"

To "arrest the extension of human slavery" was the virtue and purpose of the Republican party in a past generation, not in the present one. For "an uncertain option" on the Filipinos' lands $20 000,000 had been paid:

"In the attempt to bolster the option we have wasted over $650,000,000 more of the people's money and sacrificed over 200,000 lives. And the waste of money and the sacrifice of lives are not yet ended if the policy of the administration is to be continued indefinitely. That policy refuses to promise independence for the islanders now, or at any time, or upon any condition. It does not even leave open the door of hope. . . . If our people agree that the administration is wrong in threatening by its silence that which it undoubtedly intends—namely, perpetual bondage for the Filipinos—the remedy is in their hands. We could have donated to Spain a number of millions and annexed Cuba with equal justice and less suspicion of imbecility than we displayed in acquiring the Philippines. But we have done our duty to Cuba. We have left her to work out her own salvation—to take her place in the march of civilized nations. Shall we forbid the Filipinos to hope for independence? Shall we prevent their building up their own civilization and try to force ours upon them? Civilization is a growth, not a disguise; every race must work out its civilization in its own way."

In our own interest, also, he continued, we should be relieved of the Filipinos "as soon as they are reasonably prepared for self-government," for colonies are expensive and yield no adequate return. Only two classes of our people could hope to be benefited by our holding the islands, "the class which is always hunting for special Government privileges, and the class which seeks to make of office-holding a means of livelihood." He then quoted the assertions of "a student of conditions" in the islands (name not given) that office holders there were inefficient or corrupt and despotic, that agriculturally the country was for the time ruined, that it was overburdened by taxation, that public opinion had no free expression, newspapers were controlled by money or threats, critics of the Government were ostracised and citizens subjected to the espionage of detectives in the guise of servants. This country, Judge Parker said,

"should hasten to the relief of that situation." Would the Republican party, he asked, apply any remedy? Would it give the Filipinos tariff regulations under which they could exist? Would it assist them to become self-supporting?

"The true questions which have concerned our relations with the Philippine Islands from the moment of our taking them, and which remain to-day utterly untouched for any good to the islands themselves, and the questions which will regulate their future—in other words, the real basis on which the Philippine Islands interest us politically—are the Philippine tariff, Philippine taxation and encouragement to their shipping interests. These matters regulated to the advantage of these islands, Philippine independence will appear on the immediate horizon. Continue as we are doing to oppress these people, and one of the most vexed questions that this nation has ever been called upon to deal with will confront us interminably."

We should guard against the danger of an imperialistic policy. From republicanism to imperialism the movement is gradual and unperceived of the people. When discovered, its ominous progress left open but two courses—submission, or resort to violence. He prayed that our people should never be compelled to "choose between these fearful alternatives." We must choose eventually, and should choose now, whether the basis of our Government shall continue to be those ideas which teach that our mission is "not to seize the territory of distant peoples and rule them with a sceptre of iron, but to establish truth, honor, justice and peace among the nations," or shall be "a materialism which is the sure precursor of dissolution."—Judge Parker's assertion that the islands have cost us $650,000,000 was also made by him some time ago. Criticising it, Secretary Taft said that the cost, as officially reported, up to May, 1902, had not exceeded $189,000,000, that the cost of maintaining the troops in the islands did not exceed by more than $5,000,000 the cost of supporting them in this country, and that the civil government of the islands was self sustaining.

Other Political Topics

It appears to have been proved that many of the signatures attached to the petitions filed with the New York Secretary of State in support of the Populist ticket are those of Republicans. The law requires at least 50 signatures from each county. In two counties many of the signers have formally asked that their names be withdrawn, asserting that the signatures were obtained by misrepresentation. On the other hand, in the county where the Populist candidate for Governor resides 36 of the 120 signers were enrolled last year as Democrats.—Mr. Murphy, the leader of Tammany in New York, has forbidden the Tammany nominees to accept Populist nominations, asserting that the Populist party is merely "a Republican adjunct." "Democrats must be Democrats," he says, and those who take Populist nominations "should withdraw from the Democratic ticket." The Populists have nominated or indorsed three Tammany candidates for Congress—Mr. William R. Hearst, Mr. Towne (formerly Populist nominee for Vice-President) and Mr. Sulzer. Mr. Hearst's newspapers respond with editorial articles saying that "the Democratic party ought to be Democratic," and declaring that "the right issues and the real issues have been subordinated and neglected" by the party managers, with the result that "apathy marks the campaign from shore to shore of the continent." His papers also demand that Mr. Olney be "taken from the stump," and urge "Judge Parker and his managers to lose no time in revising the list of campaign speakers and eliminating from it the Olneys, the Clevelands and all other discredited, plutocratic and narrow-minded Democrats."—Many of the labor unions in Pennsylvania ask by formal resolution that the Republican party be opposed, owing to a controversy over work on the new capitol at Harrisburg.—In Delaware, the two Republican factions have agreed upon a State ticket, headed by Preston Lea, who has opposed Addicks.—First Assistant Robert J. Wynne has been formally appointed Postmaster-General, but it is expected that he will give way to Mr. Cortelyou in January.—Secretary Hay and the Chinese Minister have begun negotiations for a new exclusion treaty.

Report of the Slocum Disaster

The Commission appointed by Secretary Cortelyou to make a thorough investigation of the causes of the "Slocum" disaster has submitted its report, and upon the findings and recommendations of it the President has ordered the removal from office of Robert S. Rodie, Supervising Inspector of the Steamboat Inspection Service for the New York district, and James A. Dumont and Thomas A. Barrett, local inspectors at New York. By the five Commissioners (Supervising Inspector General Uhler dissenting only with respect to Rodie) these men were held directly responsible for the shortcomings of the inspection service that were disclosed in the case of the burned steamship and discovered by the reinspection to which the vessels of the district were subjected. In a letter to Secretary Metcalf, transmitting the report, the President points out that the Department of Justice has secured indictments against Captain Van Schaick, the managing directors of the steamboat company and Assistant Inspectors Lundberg and Fleming:

"In addition, the Department of Justice has secured the indictment of the manager and three employees of the Nonpareil Cork Works, of Camden, N. J., for putting upon the market compressed cork blocks for use in making life preservers, each of which blocks contained in its center a piece of bar iron weighing several ounces. This last offence was of so heinous a character that it is difficult to comment upon it with proper self-restraint. It appears that the national legislature has never enacted a law providing in set terms for the punishment of this particular species of infamy, doubtless because it never entered the head of any man that so gross an infamy could be perpetrated."

Rodie, Dumont and Barrett, he says, will be removed. Secretary Metcalf is asked to "direct their successors in office at once to conduct a thorough examination of the entire inspection force of the port of New York, with the object of weeding out all the men whom such examination shall show to be unfitted to perform the very arduous and responsible duties of their positions." He is also directed by the President to order a searching investigation into the conduct of the central office and of every subdivision of the service outside of New York. The regulations are to be changed, and Congress is to be asked to amend the laws. The President wishes special emphasis to be laid upon the proposal of the Commission "that there be created by law a special body thoroughly to investigate the laws which are supposed to provide for the safety of passengers on steamboats, especially on excursion boats, where the prime causes of danger are the overcrowding and the flimsy and highly inflammable character of the superstructure." The report contains 32,000 words. With the substance of the greater part of it the public already is familiar. The "Slocum," it says, "was not abnormal, but typical," and was "no more dangerous than scores of other steamers still carrying passengers in the port of New York, and hundreds of similar vessels elsewhere." The number of the "Slocum's" passengers who perished was 955. The reinspection of 268 vessels showed that fire pumps, hose and life preservers were in bad condition, altho all had been passed as good. On excursion boats the percentage of deficiency in life saving apparatus was 33; on ferry boats it was 14.

Work on the Panama Canal

Nearly all the members of the Canal Commission, together with Minister Barrett, were present at a long conference with the President last week. A report as to the work now in progress was made. Several hundred engineers are engaged in surveying and boring on the route, in completing plans for improving the harbors, and in preparing for the construction of water works and sewers for Colon and Panama. The reservoir for Panama will supply 2,000,000 gallons a day. From 1,500 to 2,000 cubic yards of material are removed daily from the Culebra cut. New steam shovels, now on the way to the Isthmus, will increase this output fivefold. Millions of feet of lumber have been bought, and a machinery department has been organized. Under a supervising architect the 2,200 buildings received from the French company are undergoing repairs and additional buildings are to be constructed. About 1,200 laborers are employed, many

of them in sanitary work. The question whether the canal work shall be done directly by the Commission or through contracts will not be decided for some months to come; in the meantime the Commission's preliminary work will show what the contract prices ought to be. Differences between the Panama Government and the Commission were considered. At the close of the conference Minister Barrett said:

"When I left Panama I had a perfect understanding with the Panama authorities, and I am here now working out the agreement I had with them. The main difference as to sovereignty will be settled within a short time to the satisfaction of all concerned. There is no truth in the stories of friction between myself and Admiral Walker."

Dr. Morales, legal adviser of the Panama Minister, still asserts, however, that there is great dissatisfaction on the Isthmus, and that President Amador tells him no settlement has been reached. Some causes of complaint will probably be removed by a treaty of commercial reciprocity which our State Department has under consideration. There seems to be no longer any controversy between Panama and Colombia. Boundary questions have been settled, and it is expected that friendly diplomatic relations will soon be established.

The Philippine Islands

Returning to Manila on the 14th from a tour of the provinces, the Catholic Archbishop, Rev. J. J. Harty, authorized the publication of an interview in which he expressed his desire for the election of Mr. Roosevelt. During his tour he had been greeted everywhere affectionately, and children had been brought to him for confirmation in greater numbers than ever before known in the history of the insular Church. The revolt of Aglipay, which he called a political insurrection under a clerical cloak, had been overcome, he said, and the authority of the Church of Rome had been thoroughly re-established. He continued:

"I was impressed during my journeyings by the progress of American institutions among the masses of the people, the general happiness, the security of persons and property, and the supremacy of order and justice. I believe that under divine guidance the beneficent rule of America is destined ultimately to place the Christian Malay race on a moral and political plane that as yet has never been attained by an Oriental people. This task that the Americans have assumed they cannot shirk or abandon. This work that Governor Taft so auspiciously began and that Governor Wright continues must be carried to a triumhant conclusion."

General Leonard Wood is in Manila, and will be in command until the arrival of General Corbin. In his final report the retiring commander, General Wade, says that great improvement has taken place in the archipelago during the past year. Peace prevails, except in the eastern and northern districts of Samar, where the fanatical Pulajanes have been in revolt. They have been burning unprotected villages, but the scouts and constabulary are subduing them. Business is reviving in the Moro country, where the people—Datto Ali and his followers excepted—are quiet and industrious.—The Commission has appropriated for public works 2,500,000 pesos, 700,000 of which will be expended on the road to Benguet, the summer capital.—Mgr. Agius, the appointed Apostolic Delegate, makes the journey from Rome by way of Washington, where, it is said, he will urge the adoption of measures to insure the retention on the islands of at least a part of the money still to be paid for the friars' lands.—The report of the Commission appointed to recommend changes in the tariff on goods imported into the islands will soon be published. Any reduction of the present tariff on tobacco and cigars imported into the States from the islands will be vigorously opposed by tobacco interests and labor organizations in this country.

Labor Questions

The trial of Philip Weinseimer for extorting $2,700 from George T. Essig, a contractor in New York, was in progress at the beginning of this week. Weinseimer was the walking delegate of the Plumbers' Union and also the president of the Building Trades Alliance, which was composed of the unions that went on strike and were locked out by the Employers' Association some months ago. Testimony already given is to the effect that Weinseimer demanded $2,500 of the

owner of a large apartment house in the process of construction, threatening to call a strike if the money should not be paid to him; that the owner refused to pay, and that the strike was called. When the men returned to work they received $3,000 for waiting time. This expense caused the contractor to give up his job. Essig succeeded him, and he testifies that Weinseimer extorted from him $2,700 as the price of peace. The money was paid in seven notes. Essig also testifies that he was attacked by three men in the night two weeks ago as he was entering his shop, their purpose apparently having been to kill him. Since that time he has been protected by guards provided by the District Attorney.—It is reported that the Steel Corporation has decided to spend $1,000,000 in a contest with the Amalgamated Association in carrying on the controversy that originated at the hoop mills in Youngstown and Girard, Ohio, where the members of this union have been on strike for some time.—The Glass Workers' Union has taken measures to exclude from the country, if possible, 300 Belgian workmen who are now crossing the Atlantic to take the places of union men who have refused to accept the 25 per cent. reduction of wages ordered by the American Window Glass Company. It hopes to show that these workmen are imported under contract.—In San Francisco Lieutenant Tichbourne, an officer in the militia, has been expelled from the Plumbers' Union for refusing to withdraw from the military service.—In Louisville a carpenters' union has been organized whose object is to promote the open shop and to prevent strikes and lockouts. It will have no walking delegate.—A hotel at Glassport, Pa., was wrecked by dynamite last week, presumably because forty non-union men employed by the Pittsburg Steel Foundry were lodging there. These men had taken the places of strikers. Not one of them was killed, but several were injured.

The Lippe-Detmold Succession

The death of Count Ernst of Lippe-Biesterfeld, regent of Lippe-Detmold, on September 26th, has brought to the front a very delicate question of hereditary rights in this principality, which is causing considerable excitement throughout the German Empire, because it is so closely related to the rights of succession in other German states and the power of the Emperor in such cases. The Prince of Lippe-Detmold, Charles Alexander, is insane, confined in an asylum at St. Gilgenberg, near Ausbach. When he came to the throne in 1895 the regency was assumed by Prince Adolf of Schaumburg-Lippe, who is married to Princess Victoria, the sister of Emperor William. By a decision of the King of Saxony, who was appointed arbitrator by the Federal Council, he was forced to resign the regency in 1897 to the late Count Ernst, on whose death Count Leopold of Lippe-Biesterfeld, his son, proclaimed himself regent. On October 4th the Emperor sent the following telegram:

"I express to you my condolences upon the death of your father. As the juridical situation (*Rechtslage*) is not in any way elucidated, I cannot recognize any assumption by you of the Regency or allow the troops to take the oath.—WILLIAM I. R."

This telegram, like some former ones from the Kaiser, aroused great indignation. Mass meetings were held in Lippe to protest against what is considered an assault on the constitutional rights of the principality. If Prince Alexander should die before the controversy is settled Count Leopold would, in his opinon, have the right to succeed him on the throne, and in order to prevent any lapse of legal authority in such a contingency the Government introduced a bill into the Diet of Lippe prolonging the regency of Leopold beyond the death of the reigning prince. This was rejected by the Diet, which, however, passed a resolution to the effect that the

"Diet emphatically rejects all attempts to impair the rights of the State of Lippe, and resolves to address an urgent petition to the Bundesrath requesting a speedy judicial and final settlement of the disputes regarding the succession to the throne of Lippe, either through the ordinary courts or by means of an arbitration tribunal."

The General Strike in Italy

The outside world has been kept almost entirely in the dark in regard to the very serious disorders now pre-

vailing in Italy. Telegrams from Italy have been so strictly censored that no clear idea can yet be formed of what has occurred from such fragmentary and incoherent statements as have been published in American, English and French papers. It appears that a general strike of all workingmen in Northern Italy was ordered by the revolutionary Socialists immediately following the birth of the heir apparent, as a protest against the action of the Government in the use of the military for the suppression of strikes in the mines of Sardinia and on the Genoese-Milan Railroad. It does not appear that the strike order was obeyed by any large proportion of the men to whom it was addressed, but as a demonstration of power of the Socialist committees it was startingly successful. In Milan the committees meeting in the Labor Exchange had practically the control of the city for several days, their orders being carried to all parts by a corps of 300 cyclists, with red badges on their arms. No papers were permitted to be published, except the organ of the Revolutionary Socialists, the *Bolletino dello Sciopero*. The shops and theaters were closed, the city kept in darkness, the telegraph wires cut and railroads broken. The civil government of the city was practically powerless until a sufficient number of troops were brought in to establish martial law. In Genoa and other cities the conditions were much the same. The Mayor of Venice made the following report to Prime Minister Giolitti:

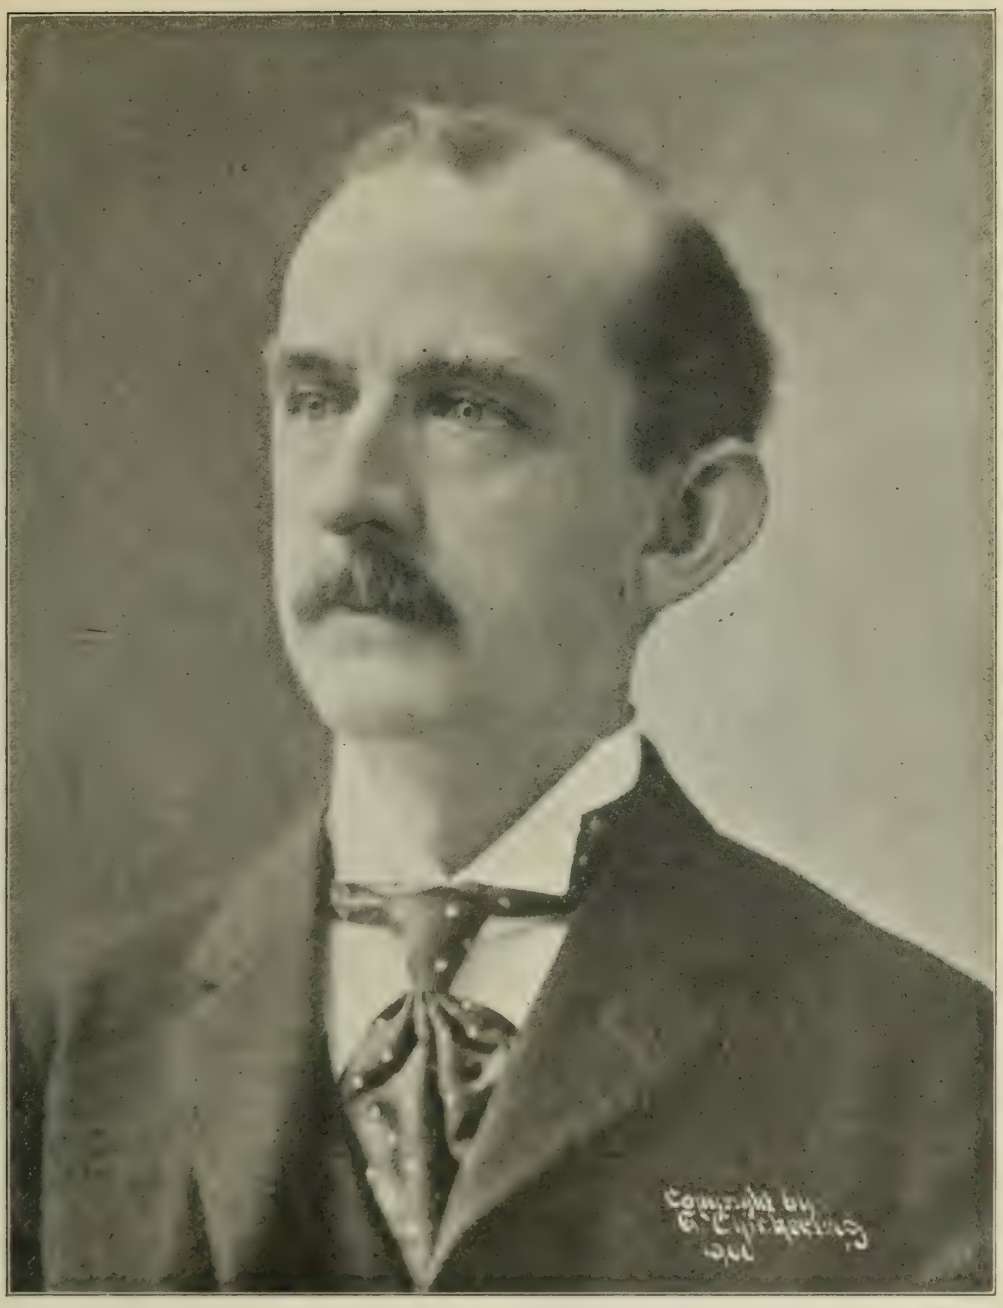
"All communication with the mainland, both by land and water suspended throughout Sunday; the illumination of the streets suspended for two whole nights; the service of both steamboats and gondolas suspended for two days; the city police violently prevented from taking the place of the striking lamplighters; the transport of the sick to the hospitals hindered, and the hospital itself left without meat and milk; the water supply threatened, and the fire brigade rendered powerless; the buildings dedicated to public worship closed by force; the shops, even those for the sale of food, prevented from being opened; the telephone wires broken in some parts of the city, the distribution of the mails rendered impossible, injuries done to the lamps and clocks of the city; the cleansing of the streets forbidden, and the whole city left a prey to disorder and tyranny—such is the spectacle which has been presented in these days to the grieved and mortified citizens, and to thousands of deeply scandalized strangers."

All available troops were ordered to the cities to restore order, and 50 000 reservists of 1903 were called out.

The Russians Defeated

The Russian advance southward to the relief of Port Arthur, which was so confidently proclaimed to be the turning point of the war, has met with a decisive check in what will be called the Battle of Shakhe River, altho it might be called the second battle of Liao-Yang, since it was fought to the north of that city as the former was to the south. In the number of men and guns engaged on both sides and in the loss of life it exceeds the first battle. Its duration was like the first, practically a week of continuous fighting from October 9th to 16th, along a front of 30 to 40 miles in extent. The information to be obtained from the Russian side is somewhat general and vague. The Japanese official reports have given every day full and apparently reliable details of the movements of each of their three armies. Unfortunately, they are not of much value to us, because no available maps give the location of the villages and mountains named in the dispatches. Even in important details the maps are at variance. In the accompanying map we have followed the French authorities in opposition to the English in making the Sha River run into the Taitse, instead of into the Hun. The map gives the approximate positions of the troops on October 9th, when the Russian advance was first checked; but no attempt has bene made to give the actual number of divisions engaged at the various points, for that is not known. After the battle the Russians retreated ten to twenty miles all along the line, closely followed by the Japanese. In explanation of the Russian disasters it is officially reported that the troops were hampered in their movements and in some places brought into untenable positions because the officers had no good maps, while the Japanese knew the country thoroughly; a curious confession of incapacity, since the Russians have had possession of the country for years and had announced to the

world that it had been selected by them as the battle ground of the war. Marshal Oyama was much criticised for not following up the Russians after their expulsion from Liao-Yang and attacking Mukden before they had time to recover from their defeat; but it is now held by some military experts that his apparent inactivity was due to a desire to entice General Kuropatkin into an attack on ground south of Mukden rather than to pursue him further into the interior of Manchuria. Whatever was the purpose, this was the result. General Kuropatkin apparently attempted to outflank the Japanese as they have so often outflanked him, and while making a strong attack on the west side of the railroad near the Hun River and also in the center, he threw most of his force on his extreme left and drove the Japanese out of the mountains near Bentsiaputza. Bensihu (Pensikou) on the Taitse River, where the Japanese had two pontoon bridges, was captured and a brigade of infantry with 2,000 cavalry and two guns was thrown across the river at a point still further east. Bensihu was the point where the Japanese made their crossing of the river which forced the evacuation of Liao-Yang; so Kuropatkin was following almost exactly the strategy of the enemy. But the result was different, for General Kuroki, in command of the Japanese right, broke the Russian line by the recapture of Tumen Pass, cut off a brigade, seized 24 guns, and forced the Russian left to retire to the northeast. At the same time the Japanese center army, under General Nodzu, drove the Russians back beyond the Shakhe River and occupied Shakhe (Sha-Ho-Po). General Oku with the army of the left was also victorious and captured ten guns. The slaughter all along the line was terrible. There were 4,500 Russian dead left in front of General Kuroki's army alone. The total Russian loss will probably exceed 30,000 men. Several hundred Russian prisoners were taken. The Japanese captured an enormous quantity of ammunition, wagons, cars and rifles. The Japanese loss so far as reported is under 4,000. The physicians and nurses on the field and at Mukden were not able to care for the thousands of wounded brought to them. So far as possible the wounded are being conveyed to



A Bivouac of the East Siberian Engineer Corps

Harbin, whither also the correspondents have been ordered, which is taken to indicate that the Russians will retire to that point without attempting to hold Mukden or Tie-Ling. General Kuropatkin took command in person in the center where the fighting was hottest October 14th and led a charge of the Petroff regiment till he came within sight of General Oku's staff on the distant heights beyond. The village of Shakhe was lost and won five times in the course of the battle. As we go to press the Russians are still holding the right (north) bank of the Shakhe (Sha) River. It is generally thought that in assuming the offensive Kuropatkin was acting under direct orders from St. Petersburg, so he does not suffer much in reputation, even tho the defeat prove as disastrous as it seems. The Russian commander speaks in the highest terms of the gallantry of the Japanese and says they are more correct in their observance of the rules of war than any enemy he has ever fought before.

Map Illustrating the Battle of Shakhe River

Winthrop Murray Crane

SENATOR HOAR'S SUCCESSOR

Winthrop Murray Crane, appointed by Governor Bates to succeed the late George F. Hoar in the United States Senate, was Governor of Massachusetts for two terms, and he declined the office of Secretary of the Treasury three years ago. He was born in 1853 at Dalton, Mass., and is now engaged there in the manufacture of paper, following his father and grandfather, the latter having established the industry in Dalton in 1801. The new Senator is a man of high character, and his advancement has not been promoted by the arts of the machine politician. Undoubtedly the Massachusetts Legislature in January will confirm the Governor's choice by formally electing ex-Governor Crane to serve during the remainder of the Senatorial term (until March 4, 1907); and it is quite probable that he will hold one of his State's two seats in the Senate for the remainder of his life.

Field Notes

BY A JAPANESE SURGEON

[The following article throws a very interesting side light on the character of the Japanese army in the field. The article is translated and edited by Adashi Kinnosuke. —EDITOR.]

"HOW is it with you, the Red Cross people? Have you not had a number of casualties even among your people in this war?" said Field Marshal Oyama to me on his way to the front. And, indeed, in the violence of their zeal Russian bullets have paid not a few compliments to the headquarters of the Red Cross.

It was little past seven o'clock on the evening of the 24th of July, and the place was near Tashichau, in the village of Taping. That was the time and that was the place where I received my first wound. The battle was savage, and the shots that fell round about the field hospital were quite thick. From all over the battlefield came the call for the surgeon. I was stooping over a soldier who was severely wounded. I had my back to the enemy's fire. My brave fellow was shot in his right leg. I was doing what I could for him. At the time I was at peace with most people and all the gods, thinking I was engaged in a good work. I was somewhat surprised, therefore, by a sudden visit from a Russian bullet just at that time. I felt as if somebody had taken a stout iron rod to me with a certain degree of violence. Not in the least did I suspect that I was shot. The first news that I was wounded came from an army nurse, a man whom I knew very well and who is called Fukazawa. I saw him rush over the wounded and the blood-stained battlefield toward me. Bandages were flying from his hand, his eyes were wild. He seemed to be very much excited, and he was scandalized to find that I was perfectly innocent of the fact that I was hit. He went for my wound as if his very life were dependent upon it. (Permit me to indulge in the pleasure of saying a few words about this good friend in the time of rather sore need. This man Fukazawa had served in the Nippon-China war. He was a man of considerable experience. He was very proud of a medal which was awarded him for many excellent things he had done in the war of 1894-5. So steady was his nerve that the surgeons declared that he had no nervous system at all).

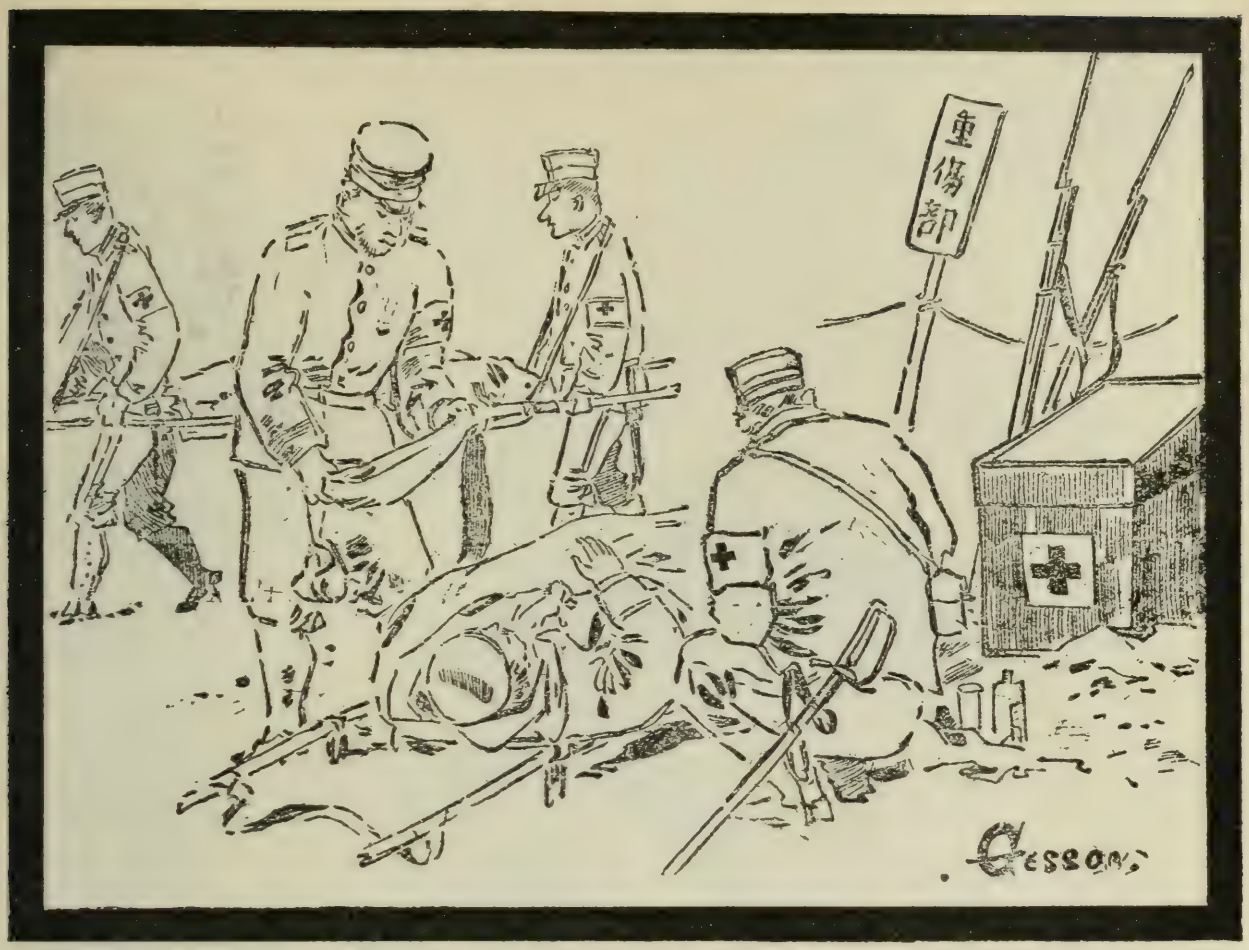
The war has wrought many singular changes in our soldiers. At home, in camp, it has been the experience of all of us surgeons to find a soldier here and there who would come with a plausible story of some complaint from which he was suffering. He would ask for a statement from us that he might be excused from the daily exercise. Many a time, just upon such an application, and on examination, I have been completely and pleasantly disappointed to find not the least shadow of illness about the men. They fancy, in times of peace, and tax the cleverness of their wits and imagination pretty severely, that there is something the matter with them which is quite enough to excuse them from the rather trying ordeal of going through the daily exercise to which they are put. Now upon the battlefield the contrary is the fact. Our men, who are indifferent both to the Russian bullet and to hostile swords, they who laugh at the Russian mines and barb wire fences, and delight in joking frivolously about death, seem to be afraid of one thing: they are afraid of being suspected of being ill at all. They know that when a man is sick he is denied the pleasure and distinction of fighting on the first line of

battle. The other day I came upon a man who was carrying four bullets within him. I said to him, seeing his clothes were bloody, "What is the matter? Are you not wounded?" He turned to me with a smile and said, "Oh, no, not at all, sir; I am perfectly well." I saw him limp. I laid a violent hand upon him and subjected him to an examination. As I have said, I found four bullets in his body. I meet with just such a case a hundred times more or less every day. They shun the surgeon as they would the very demon, and it is very much more difficult to discover a man who is ill than a man carrying four bullets. Not a single soldier has come to us and complained of his illness. Always they have taken care to conceal the first symptoms of disease, and by the time the medical men are able to find out that a man is ill he finds his patient completely beyond the assistance of medical science. This is working hardship upon our men and upon our hospital corps. Men who could have been cured in the earlier stages of their illness are dying from this peculiar attitude of the Nippon soldier.

To see him in his endeavor to remain on the fighting line, and it matters little whether he is mortally wounded or seriously ill, you would say that the Nippon soldier is certainly insane. To fight every minute of the day and night seems to be the one thing he wants. He is a casuist of the purest water. He troubles himself very little as to the methods, so long as the end in view is attained. He taxes his wit to the utmost. He seems to put in all his lonely hours in the lull of fighting to frame many plausible yarns with which to blind the searching eyes of his superior officers and surgeons in their attempt to discover a sign of illness or of wounds that he might be carrying and from which he is dying. Many of these white lies bring tears to most of us. Even when they are amusing in their lameness, the tales they tell throw more light for the student of the Nippon soldier than any heavy volume of official reports. As if we have not enough to do, therefore, we are obliged to keep our eyes sharply upon every private so that we may catch him in his unguarded moment and save him in spite of himself.

The effect of the first wound or two on our soldier is rather striking. In-

Hospital Corps Along the Yalu. From a sketch made on the field by a Japanese artist, and published in the daily "Kokumin," of Tokyo



stead of stopping him, they invariably help to fire him with enthusiasm and to increase his energy. I have no psychological explanation to account for this singular phenomena. As a matter of fact, I simply jot down my observation that almost every soldier who receives a wound seems to rush forward with double the energy and enthusiasm toward the hostile positions. "It is quite natural," said a friend of mine in explanation of this thing. "In front of you is the Russian. He punctures you with a bullet. It is very far from human nature if you suddenly become entirely indifferent to your Russian friend. The compliment is paid you, why should you not have a certain desire to return it. As the Russian friend in the hostile line becomes interesting, you want to get closer to him. I suppose this is natural."

Many a time have I myself heard a soldier rushing forward with the cry, "Rosky, you brutes! Wait a minute! We will show you a thing or two!" And invariably, whenever I hear this cry, I know that the soldier who is rushing past me is wounded. As a simple statement of fact I may be permitted to put down here that, in the minds of our soldier boys, the field hospital is a Hades, compared to which the desperate hand-to-hand fighting with the Russian is a rather entertaining Paradise. It was yesterday that I actually stumbled over a soldier. He was down on the ground. So severely had he been wounded that he could not continue his forward march. I said to him: "Here, my man, you are wounded. Let me call a stretcher. You have no time to lose in making your way to the hospital." In answer he turned his face to me and laughed out loud, and said: "Why, sir, there is nothing the matter with me at all. Is it possible that the august presence is so blind as not to see that I am resting a bit? I had to run a great deal and I am somewhat tired; that is all. Wait a minute, then you will see how I will get at those Russians, and you will be thoroughly satisfied that I am as healthy as the next man." Do you know that the men of the hospital and myself had actually to use physical force to get this fellow upon the stretcher and carry him to the rear?

Our horsemen are in love with their mounts, and their love for their horses gives a delicate touch of romance which is always charming beyond words and sometimes quite heartrending. Our soldiers, who have such a convenient knack of forgetting their own comfort so completely always remember the hardships through which their horses are passing in this present campaign. Can a man love his horse better than his own life? In your gross ignorance I see you are smiling at the very question. The behavior of the tired soldier at the end of a long and tedious march, as he leads his horse to a stream through the dusk of the falling day, is an eloquent comment on this question. About a week ago I came upon a company of men who were engaged in transporting supplies for the army. They had marched quite a distance over a roadless country. The march was beastly, the weather was vile and the roadless country was the worst of all. The horses were tired. Depend upon it, the men were quite as tired as the horses. As soon as they came to a halt I saw a number of these fellows rush with their own canteens in the direction of a little stream of water.

"Why don't you lead your horses to the stream?" I asked one of the horsemen, who was about to start with his canteen. He turned his face to me; the expression upon his face seemed to say, "Is it possible that there lives a man who is so dull-eyed as to fail to see the tired condition of the horses, and whose heart is so stony as to have no mercy for them?" What he said was simply this: "Why? Why, dear sir, these horses have made many miles over the country where they are too barbarous to have roads. They are tired, and we are running to fetch some water for them." And they did run, these men, like mad, fetching water, fodder and what little green vegetation there could be found. Seeing them handling their horses, stroking them and talking to them, you would have supposed that they were nursing so many sick babies of their own instead of dray horses.

And these men, after fetching food and drink for the horses, after comforting them with all kinds of caresses, both of words and tender strokes of hands, these tired men turned in and took to

Caring for the Wounded in the Field Hospital. From a sketch made on the field by a Japanese artist, and published in the daily "Kokumin," of Tokyo

cooking beans in iron pots. Ask them why it is when they are so thoroughly tired, while their stomachs are empty and their legs are aching under them, they should take the trouble of cooking dry beans which are not meant for their mouths. In explaining this matter to a friend of mine I heard one of these transport men say: "You see, sir, green feed, I mean too much of it, is not always good for the horses. Sometimes green feed and a strange climate make a rather rocky combination for the poor horse, and then you know these Chinese beans are not the softest things that you could bite, and heaven knows these horses of ours have enough trouble without swallowing these beans green and uncooked. That is the reason why we cook them and make them soft and healthier for our horses."

When they have given the horses all the attention they can think of, naturally they find themselves entirely too fatigued to look after their own comfort. No sooner are they done with their duties toward their horses than you find these good horsemen of ours rolling themselves up in a blanket and throwing themselves as if they were so many sacks of potatoes down anywhere at the feet of their horses, and pull for all they are worth for the land of sleep. It is rather noisy, this land of their sleep, so completely innocent and exhausted are these horsemen. Now, these are the scenes that you see every day. They are touching enough in themselves, but something desperate would happen when a horse became ill. I came upon a soldier the other day. He was forlorn and downcast. The sudden announcement of his mother's death could hardly make a man so broken-hearted. He was trudging along a dusty highway and crying like a child. I laid my hand upon his shoulder and asked him, "What is the matter? Are you wounded?" Startled at first by the touch of my hand upon his shoulder, but in a second recognizing that I was nothing more than a surgeon, he shook his head, without saying

The Genius of the Red Cross Weeping Over the Heroic Dead. By the Japanese artist Kodo

a word. Then he went on crying as bitterly as ever. Naturally, I questioned him as to the reason for his grief. All the answer I received was a series of sobs, which were more heartrending than the ones that had shaken his body, and, always weeping, he struggled on. I could not understand the reason why. He aroused my curiosity. I made up my mind to find out what the matter was with this soldier. I believe I tried upon him all the difficult, varied and delicate diplomacy, threatened him, comforted him and coaxed him to tell me something of his trouble. At last he tried to say something, but could hardly say one word. His sobs broke even one word to so many pieces that I was obliged to sharpen my wit and senses pretty keenly in order to catch the meaning of what he was trying to say. I fancied that he said something about his horse. "What about the horse?" I asked. He was overwhelmed once more with his grief, with his tears and with his heartrending sobs. It was very pitiful, and the sight of him touched my heart to such an extent that I was voiceless for many a minute. As soon as I regained my breath, with a hard-heartedness that passes all understanding I persisted in saying: "What did you say was the matter with your horse?"

"D-d-d-dead!" he at last managed to blurt out, and once again he was overwhelmed by the storm of tears and sobs that seemed to rend him into a thousand pieces. I do not know why I did not laugh outright. Perhaps his grief was too overwhelming, and there is that dignity that always belongs to the expression of sincere human emotion.

I have seen many a soldier burying a hundred of his dead comrades after a fight. I have never seen such an overwhelming expression of grief as was shown by this lonely fellow who had lost his horse and refused to be comforted.

The sanitary regulations of the army

are rather strict. Every morning the soldiers are required to boil water, put it up in their canteens, and carry it along, but it is impossible to put in enough boiled water in the morning to last all day, so, in spite of all the things that are done, it is impossible to keep them from drinking the water from the creeks and rivers on their way. The authorities are thinking of devising some means of affording them sufficiently large canteens to give them enough water for the day.

MANTURIA

The Unsailed Frigate

BY THEODORE ROBERTS

THERE'S a frigate ribbed with granite,
Decked with rock, and granite keeled,
By a dull world long forgotten,
In the Navy List revealed;

That has never set a stuns'il,
Never known a course to sail;
That has never wet a scupper,
Under tops'ils, in a gale.

Long ago she won to glory!
Still she fronts the surf and spray,
Tho her guns are rusted now
And her captain laid away.

Long ago she did her duty!
Faced the Frenchmen, shock on shock,
Sailed to glory without moving—
Six-gun frigate "Diamond Rock."

In the days when France and England
Fed their hate with blood and wreck
From Barbados, set in coral,
To the ramparts of Quebec,

There was trouble in the islands—
Smoke to windward—smoke a-lee—
And old Rodney chasing Frenchmen
Up and down the Carib Sea.

Sometimes, tho, the quarry hunted!
Valor was with either side
And the odds were often turning
With the turning of the tide.

Round St. Lucia, one December,
There was fighting to be done;
And the French had four stout frigates,
And the English only one.

Said the English captain then,
Spying down the rocking blue,
"Four to one—'tis one too many!
What the devil will I do?"

Answered him a gay lieutenant,
Long of limb and red of face:
"Let me off on Diamond Rock
And I'll try to hold the place."

So they landed him next morning—
(Stores and guns and a cutter's crew)—
Squared their yards and sailed away
To find another prize or two.

Well, the young lieutenant held it!
Fought his rock, and ruled those seas.
Never sailed a knot to carry
Word of his great victories.

Set his watches; flew his ensign
(Thniner grew his boyish face);
Nursed the wounded; whipped the skulkers,
Worked his guns—and held the place.

Two long years, through sun and tempest,
Heat, fatigue, and battle-shock,
E'er the fifteenth boarding party
Climbed the sides of Diamond Rock.

Two long years! And then they took him!
Smiling, he went down the side,
Thinking of the ten tall frigates
He had sent to feed the tide.

There's a warship ribbed with granite.
Long ago she won to fame
High among the ships of England—
"H. M. S." before her name.

Now the cruisers, steaming southward,
Sight her hull, and shift, and run
Close along the granite bulwarks,
High and sombre in the sun;

And the great guns do her honor—
Roll their smoke and spit their flame.

* * * * * *

In the Navy List you'll find her,
"H. M. S." before her name.

"ELBERTON," BATHSHEBA, BARBADOS, B. W. I.

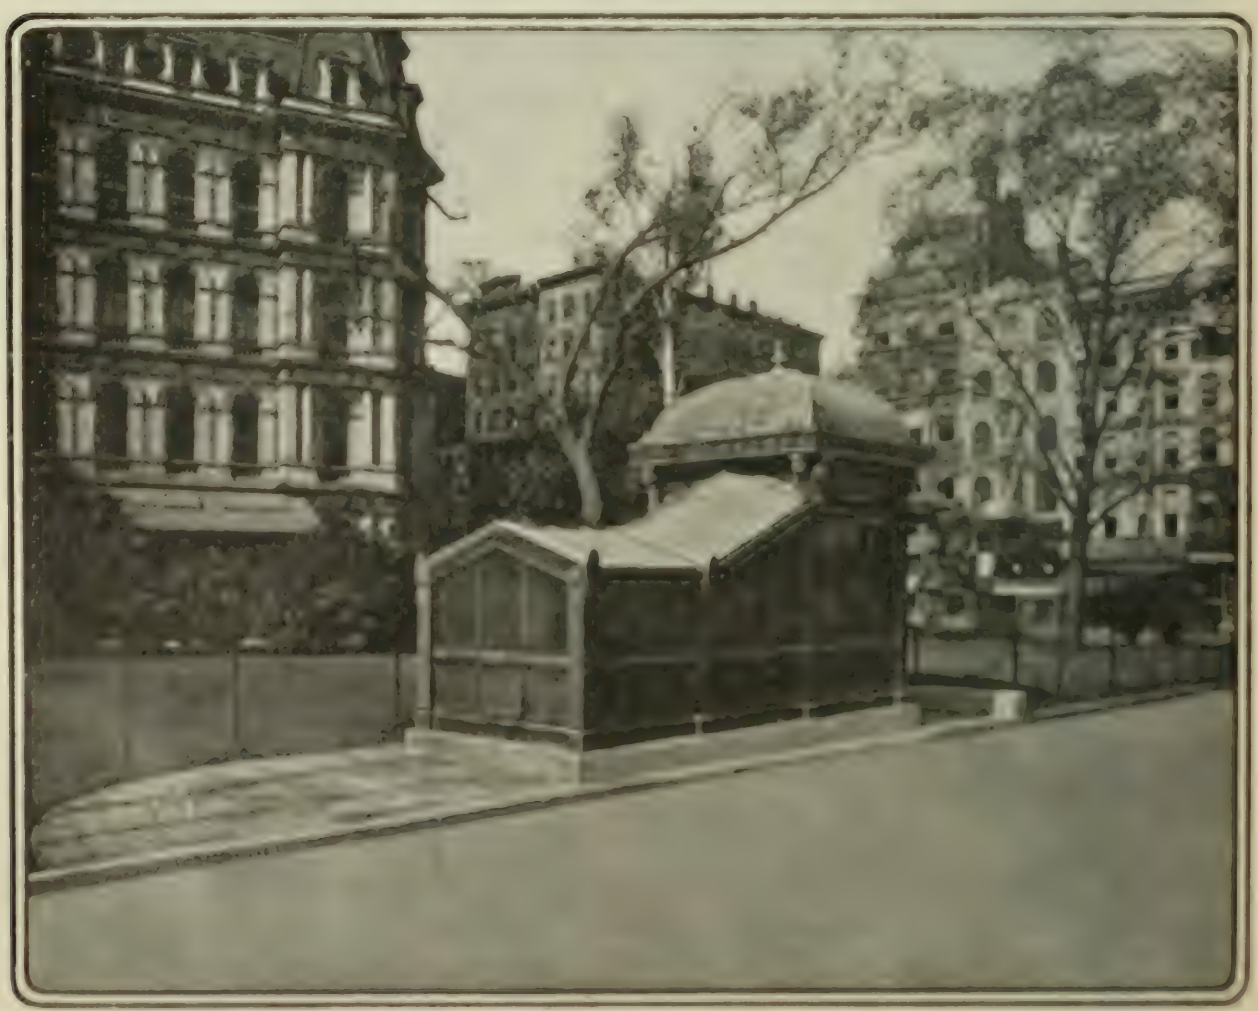
New York's New Underground World

BY JOHN T. HETRICK

[Next week Thursday the New York Subway—the greatest underground railway in the world—will be opened. We are therefore glad to give our readers the following article from Mr. Hetrick, of the Interborough Rapid Transit Company.—EDITOR.]

WHEN a taxpayer of a municipality in this country reads in his morning newspaper that a contract has been let for a public improvement costing one million or more, he naturally says:

"More 'graft' for the politicians."



So inbred has become this idea of "Commercialism in Politics" and public life that every office-holder, be he honest or dishonest, is certain that his public acts are being watched by the two "R's"—reporters and reformers. When a contract involving the expenditure of thirty-five milions of public money has been carried out to the letter and practically on time, the wonderment of the public is so great as to excite general curiosity. These questions are naturally asked:

How was the Subway in New York built without scandal being attached to any official, high or low?

What system prevented the politicians from getting their "graft" out of the contract?

What safeguards were adopted to prevent the minor officials from being dishonest?

The answer to all these questions is that the construction of the New York

Subway Station at Twenty-third Street. Copyright, 1904, Pierre P. Pullis

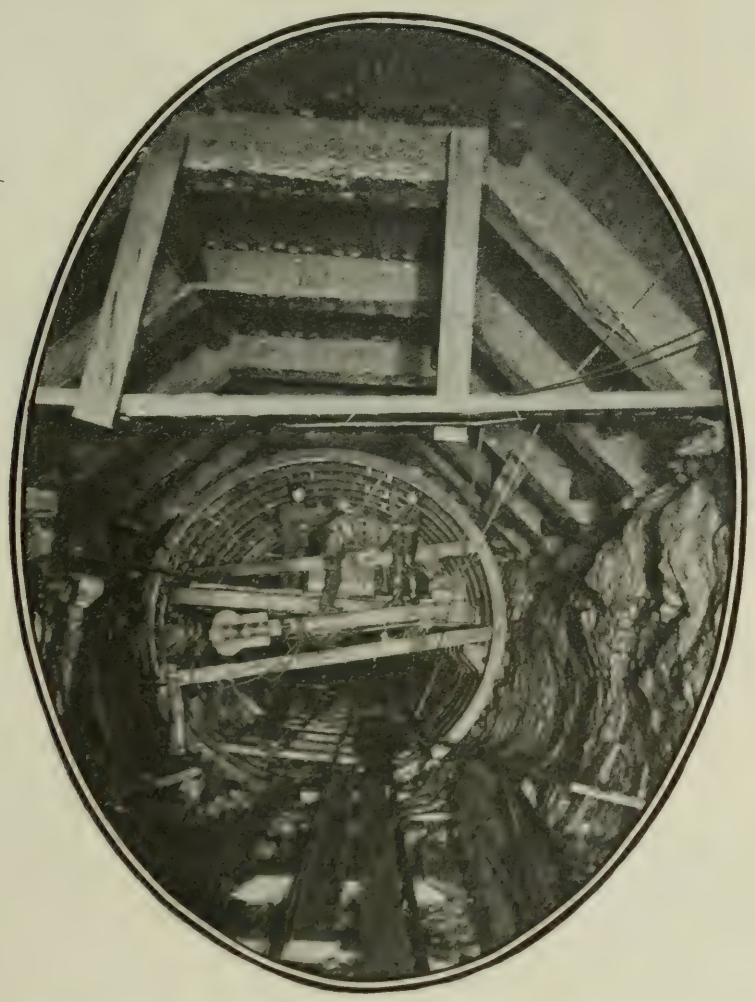
Subway was a business proposition carried to a successful fruition by business men whose reputations were at stake and who would never allow the taint of dishonesty to enter any work in which they were interested. While the Subway is public property, the responsibility for all expenditures was in a large measure lodged in the Interborough Rapid Transit Company, the lessees of the system for a term of fifty years.

The city's interests were looked after by the Rapid Transit Commission and Chief Engineer William Barclay Parsons, who designed the Subway. The interests of the lessees were looked after by August Belmont, President of the Interborough Rapid Transit Company, and Contractor John B. McDonald, the successful bidder for the tunnel contract. The final check on all expenditures was the Finance Department of the city, headed in turn by Comptrollers Bird S. Coler and Edward M. Grout.

"In after years every man connected with the construction of the New York Subway will be proud to say that he was on this work," said Chief Engineer Parsons to a friend recently. "There have been no scandals of any kind, and no one has ever dared to insinuate that any official, from the highest to the lowest, has done other than hard, faithful and honest work on this vast contract."

Now that the Subway is about to be opened it is proper that a few facts of the "dark period" in the history of the New York Rapid Transit system should be told. When, after years of agitation and two unsuccessful attempts had been made to get capitalists interested in the project, the contract for the construction and operation of the Subway was awarded to John B. McDonald at his bid of $35,000,000 for construction, financiers interested in the great railroad systems refused to undertake the project of tunneling through rock-ribbed New York in close proximity to the foundation walls of skyscrapers down-town. Capital was afraid. Contractor McDonald, who had deposited with the city a forfeit of $100,000, could not at first get the backing to carry through the plan, and he faced a

loss of money and prestige. In this emergency an appeal was made to August Belmont, head of the banking firm of August Belmont & Company, to take up the work. The then masters of the transit situation in New York, led by the late William C. Whitney, declined to undertake the contract except on the basis of a franchise in perpetuity. Public disapproval prevented such a contract from being made. It seemed as if New York was doomed to another disappointment and that the old slogan, "Battery to Harlem in Fifteen Minutes," would be shouted for many years to come without a spadeful of earth being turned. In this crisis August Belmont saw the possibilities of the situation. He gave his personal pledge and that of his banking firm to carry out the Rapid Transit project. It took the financier but a few days to see that it would be impossible to sign the contract with the city under the restrictions imposed. The bond demanded would place the builders of the road absolutely in control of the guaranty and surety companies, who were then asking exorbitant rates for the risk involved. With characteristic energy Mr. Belmont set to work to cut the Gordian knot. He showed the Rapid Transit Commission that an excessive bond was useless, as millions of dollars would have to be spent by the company undertaking the operation of the road. Mr. Belmont placed several millions of his own money and securities in the city treasury and formed the Rapid Transit Subway Construction Company. In a short time men who had refused to bid for the contract were anxious to invest their millions in the enterprise with August Belmont at the head. The details were concluded, and on March 24, 1900, the work of construction began.



What might be called the "Subway Age" of New York will be inaugurated on October 27, 1904, when the thirty-five mile system, costing more than seventy-five million dollars for construction and

August Belmont in His Private Office

equipment, will be open for public travel. The rock blasting, sand digging and construction work has taken three years and seven months, including delays caused by strikes and labor troubles of nearly a year.

The favored few who have investigated the new transit system are enthusiastic. Engineers and tunnel builders from London and Paris have declared the New York Subway to be the finest and largest in the world. The St. Gothard and Mt. Cenis tunnels are small as compared with the New York Subway, while the London and Paris underground roads are behind the times when compared with the "near-the-surface" system of this city.

Rock Work, Entrance to East River Tunnel at the Battery

To those connected with this work it is plain that so many new features will be introduced into New York's life by the new Subway as to warrant the assertion that a "New World" has been created by engineering skill. At first designed as a north and south bound transit system, the plans have been gradually broadened until the life of the Metropolis will center around the express and local stations of the road. To show that this statement is true let the reader take an imaginary "Seeing New York" trip, not on the surface in a big double-decked automobile, but on one of the Subway cars. Starting from the Battery, where the dip is made under the East River to Brooklyn, and traveling north, the car will pass near the foundations of the great sky-scrapers. When near Trinity Church the side of the car will be within ten feet of the foundations of this historic edifice. Then comes the new $5,000,000 Trinity Building, in course of construction. The tenants of this building will not come to the surface of the street to go to and from business, but will walk through a large underground arcade lined with stores and kiosks. Here a man can buy his evening newspapers, tickets to theaters, flowers and candy for home or girl, and hundreds of other necessities or luxuries. Responsibility for this class of shopping has been

Broadway and 120th Street

gradually shifted on the busy New Yorker until there is danger of the "male shoppers" repeating daily in the underground stations the rush for bargains which result in crushed millinery and trampled dresses in department stores when "gentle woman" emulates the rush-line of a football game to save two cents. The builders expect that many new business enterprises will take advantage of the enormous traffic through the Subway to make of this station in the Trinity Building one of the most important centers of activity in the down-town district.

A few blocks further up-town and City Hall is reached. Here on the surface every evening there are thousands of people jammed together, crowding the cars to Brooklyn and other lines of travel. When the large station of the Subway is opened express trains of seven cars and local trains of six cars will carry thousands north to homes in Manhattan and the Bronx. The tides of travel will be divided, and it is expected that the opening of the Subway will mark the end of the disgraceful scenes which are now nightly enacted at the Bridge entrance.

The next center of business activity reached on the trip up-town which will be effected by the Subway is at Astor Place, Eighth and Ninth streets. Here a new skyscraper department store has been built, with a large arcade entrance from the underground road direct to the building. Shoppers from the Bronx, Brooklyn and Manhattan will journey to this place, make all their purchases and return to their homes without seeing how down-town New York looks, unless they desire to walk the streets. When the Pennsylvania tunnel is completed it will be possible for a passenger to come from any section of the United States West or South, go through underground New York to theaters, apartment houses, stores and do all his business or pleasure seeking without viewing the old city above ground. When the connection is made at the Grand Central Depot with the Subway, travelers from the North and East may do likewise.

Along the route above the Grand Cen-

tral Depot arcades have been built at several stations which allow passengers to enter hotels, rathskellers and business buildings without coming to the street. At Broadway and Forty-second Street the tunnel runs through the sub-cellar of a building now being constructed for a newspaper. A magnificent arcade is being built in this station and it has been designed with the idea of making this point one of the show places of the underground system. Towering above the Subway kiosks, which are on the street surface of Times Square, will be the highest office structure in New York.

It has required an army of nearly ten thousand men to construct the Subway. A few figures will show the vast amount of work done. It was necessary to excavate about 3,212,000 cubic yards of material, of which 1,900,000 cubic yards was earth, and 1,312,000 cubic yards of rock had to be blasted in open cut and in the tunnels from Thirty-fourth Street along Park Avenue and also the Fort George tunnel. The cost of excavating was about one-third of the entire cost of the Subway. In construction work 65,000 tons of steel were used and 8,000 tons of cast iron. There was laid 551,000 yards of concrete and 910,000 yards of waterproofing. The total length of track laid is 305,000 feet, of which 245,000 feet is underground and 60,000 feet is on elevated structures in the upper sections of Manhattan and the Bronx.

In designing the Subway it was planned to keep the stations of the road as near the surface as possible. The old type of deep tunnel such as exists in London was discarded because of the discomforts of travel which the people of the English metropolis have experienced. Throughout most of its length the New York Subway is only four or five feet beneath the surface of the street, and it is clear that the walk downstairs to the platforms is not tedious or tiring. Light and air are admitted to many of the stations by means of glass, cement and iron vault-lights, and so well has the work of waterproofing been done throughout the Sub-

Eleventh Avenue, Fort George

Looking Out from the Subway Tunnel, 157th Street and Broadway

way that it is dry and has none of the disagreeable dampness which has caused criticism of foreign tunnels.

From the Brooklyn Bridge to Thirty-third Street the Subway consists of a single tunnel having four tracks, two for local and two for express trains. The tunnel is so planned that only express trains will run on express tracks and only local trains on local tracks. From Thirty-fourth Street to Forty-second Street the road is divided and the tunnels pass on either side of the tunnel of the Metropolitan Street Railroad at a level considerably lower. Through this rock section the simplest form of tunnel was used, consisting of a three-centered concrete arch supporting the roof and resting on concrete sidewalls founded upon the concrete floor. The two tunnels at Forty-second Street and the Grand Central Depot curve to the west and again unite in a four-track single steel tunnel. At Broadway the tunnel again curves into this main thoroughfare of the city up to One Hundred and Fourth Street, where it divides into an East Side line and a West Side line.

And, best of all, the carrying capacity of the road is calculated to be nearly 100,000 people an hour. What that means to the daily traveler on our present crowded elevated and surface cars only a New Yorker can understand.

New York City

From Cell to Song

BY ADDISON BALLARD

And what, I said, is this to me,
Who doubt the life it comes to teach,
But a stray pebble from the beach,
Worn smooth and oval by the sea?

The tiny prison-house, one morn,
In ruins lay, a shattered shell;
But joyous out from heaven fell
A sky-lark's song, and Hope was born!

Fitchburg, Mass.

The West Through Eastern Eyes

BY STEPHEN M. DALE

[This article was written early in September. Mr. Dale is singularly well fitted to pass the judgments that he does, and was singularly fortunate, as well, in the conditions under which he made the journey he describes. Traveling as he did in the guise of a journalist, on a pass and with a purpose, bearing letters, as he also did, to many people of many sorts and conditions and in many lines of business and profession, he had entrée to certain fields not usually visited, and was equipped with means to view things at close range. Traveling, as he also did, in company with a financier, he had opportunity to gain, through his eyes, unusual insight into business and economic conditions.—EDITOR.]

ONE week ago I returned from a trip to the Far West. In just two months—I had traveled over six thousand miles of country, was in fifteen different States, on ten different railroads, in a dozen cities of first-class importance and a dozen others of the second class. In traveling thus in such short time across the continent and back, what I saw was, to be sure, a mere glimpse, and observations made therefrom can be at best but superficial. And yet, just as this method has its disadvantages, so it has also its advantages; just in proportion as the onlooker sees most of the game, and just in proportion as things that are novel strike most him who sees them for the first time, so my very verdancy and the haste with which I viewed these scenes may give some value to deductions I have drawn. I stayed in no one place long enough for the novelty to wear off, and thereby escaped the danger of having striking things come to appear commonplace, as they did, for example, to the veteran soldier who, after the battle, sat down to write home and could think of nothing to say.

Both our route and the stages into which we broke it we planned with a purpose. Going out, that route lay over the New York Central, the Lake Shore, the St. Paul and Northern Pacific railroads to the coast; back it was over the Southern, the Central and Union Pacific, the Big Four and Pennsylvania lines to New York. We went by short stages, stopping at many points; we returned by one long five days' journey, crossing thus the entire width of the continent in one continuous trip. It is only by this second method, that of riding thus and looking out upon his country as a whole from a car window as it flies past in review at perhaps thirty miles an hour, twenty-four hours a day, for five full days, that one can ever get any conception of the enormity of that country's expanse; it is only by the first method, that of stopping off to view parts in detail, that he can ever gain any idea of the abundance of its wealth, the variety of its resources and the versatility of its people.

Traveling thus over this route and in this manner, we traversed in consequence some very varied regions and encountered many types of people in as many places. We passed through the vineyards of Northern New York, looked out upon the country about the Great Lakes, visited the pork packing establishments of Chicago, the great flouring mills of St. Paul and Minneapolis, the world-famed mines and smelters of Montana, the irrigation canals of Idaho, Utah and Wyoming, and the gold and silver mines of Colorado; crossed the Mississippi River and the Rocky Mountains and traversed the Corn Belt and Wheat Belt. We visited all the important cities in a dozen States, went into the lumber camps of the Northwest, out with the salmon fishing fleet at the mouth of the Columbia River, through the Yellowstone Park and the Yosemite Valley. We held interviews with doctors, lawyers, clergymen, school teachers and public men of every grade, from editors of newspapers and political celebrants to street fakirs. While, best of all, from the point of view of estimating character and seeing extraordinary "types," we mingled with the men who were our fellow-travelers, from cowpunchers, Indians and Chinamen in day coaches to railroad officials and land magnates in the smoking compartment

of our Pullman. The variety of scenery through which we passed was thus paralleled by the variety of men we met and of occupations in which we found them engaged.

Out of it all the one conviction that comes over me most strongly when I come back to New York, and the one impression that I find most deeply made, is that the East, speaking generally, knows absolutely nothing about the West. To the average Far Easterner the Far West is still a *terra incognita*. And especially is this true of New York. I had always known that New York was provincial; I had never realized before how much so it could be. It is perfectly absurd how little those who think they know their country best know about this which is that country's greater half. As an Englishman knows his Paris, so a New Yorker knows his London; but he does not know his West.

And by this West I mean the Far West, or, better still, as it can be more aptly called, the "Big West." To localize this district I mean that which is west of Chicago, for what Buffalo used to be in the days of the "put me off" story Chicago is to-day. It is the point toward which every line of pilgrimage from either side converges; it is the point from which everything is either east or west. It is not until one has changed cars there and has boarded one of the trunk line trains and started on again, this time to follow for whole days at a time the course of the setting sun, that he begins to breathe that different life, the very flavor of which in his nostrils is unmistakable.

Nor am I concerned with the Middle West. It is by no means interesting; its topography is level, flat and dismal, and its people are as correspondingly commonplace. It is neither one thing nor the other. It looks both ways for light. It is interesting to note how the people there talk with corresponding phrases about going "down east to New York," or going "down west to San Francisco." And the reason for this becomes perfectly plain to one who traverses the continent in one continuous ride. On such a ride there is easily noticeable the way in which life and activity begin to slow up as he advances from either coast toward the center and then begin again to increase with accelerating rate toward the other. My special point is that, after he has passed this dead center, moving toward the West, he begins to feel his pulses quicken so in keeping with the life about him that by the time he has reached the Western coast he finds everything proceeding with the vim and rush and vigor of the Eastern port he left behind.

To be sure, in speaking of the Far West in contrast with the Far East one may not use merely laudatory phrases; in any such study there are things both *pro* and *con*. There are many things the actual sight of which is sadly disillusionizing. Especially is this true of places. Just as people are disappointed when abroad on coming into sight of places of which they have all their lives seen photographs, which photographs gave to the things a reputation and a charm the things themselves could never justify and which charm consequently is not realized upon approach, so of the West; its mountains are, after all, only hills; and its rivers only streams of water—larger, to be sure, but just as muddy as those anywhere else. A prairie, too, is but a level field and a ranch nothing but a farm—large also, to be sure, but then farming can be only farming, altho called by any other name. All these are "cons," however; it was of the "pros" that I set out in an attempt to write.

Mechanical Features and Institutions.—In such an attempt there come first in any such a series of contrasts those of mere mechanical equipment; and of these, first of all, because simplest of all and most noticeable of all, are *the railroads* of the West. Both in their appearance and their operation the Western are in marked contrast to the Eastern railroads. As every one knows, yet perhaps not every one, they are all single-track roads. How nearly universal is this characteristic is shown by the fact that one road advertises as its claim to patronage "The only double track road between Chicago and the Missouri River." Beyond the Missouri there is none. Again, their construction was a more simple task than was that of railroads in the East. For hundreds of miles the country will be found so level that not a cut or fill or grade is needed; consequently the task

of building such a road consisted merely in surveying the route, running a ditch on either side to drain the roadbed and ballasting up a row of ties to hold a pair of rails. The building of many of them was done in many cases too soon, perhaps; there were probably too many competing parallel lines built in that singularly unique period of general railway construction a quarter of a century ago, but they have "arrived" at last. It is a far cry from Jay Gould's "two streaks of rust through an uninhabited plain" to the condition of that same one of these great trunk lines to-day.

And the whole idea of railroading, the very *raison d'être* of railroads in the West, is wholly different from that in the East. The two methods of operation are different, as the ends to be gained are different. The aim of these transcontinental lines is almost exactly the aim of the transoceanic steamship lines. Their object is to connect points far removed from one another and separated from each other by land which is itself in large part worthless and in large part consequently uninhabited. Out of this fact there grows another, as a corollary would out of a proposition in geometry, viz.: that of railroads in the West, both the officials and employees are conspicuously more courteous than in the East. This might be ascribed to the custom of the country; it might be because that competition there is greater, more lines connecting the same points and hence more chance for travelers to choose; but it is more probably because of the peculiarity cited above, the "long hauls." Many of the roads have only two through passenger trains a day, but these two trains are longer, the cars are larger, the seats are more comfortable than on Eastern roads, and in every way local traffic is subordinated to through traffic. The same train conductor is with a party all day and the same Pullman conductor for three or four days, so that their relation to the passengers becomes almost that of the captain of an ocean steamer to those in his charge.

Secondly, there is a striking contrast between *the cities* of the East and West —in their public buildings, their public works, their heating, lighting and water supply systems, and, chiefest of all, in their street car lines. Rates for use of all these things are lower and accommodations better, the climax of all street railway systems, for example, being reached in that system—the Twin City Rapid Transit—which connects St. Paul and Minneapolis and which is conceded on all hands to be the standard system of the world. The hotels, stores, theaters and public buildings, too, are finer by far than those of cities of corresponding size in the East, the use of electricity for both light and power having become general there earlier than here.

All of which is due no doubt to several very simple causes. One is that such systems in each city have all been organized at one time by one corporation and under one management. This was because the period of the construction of these things fell within the range of that modern era dominated by the spirit of combination. What others have had to bring about elsewhere by means of deals and consolidations these were able to do at the start; nor did they have to wait until one system still partly efficient was wholly worn out or until the period of its franchise had wholly elapsed. There was no economic waste to be considered; they could build on clear ground and build well early. Doing all this, too, so long after their Eastern neighbors had done similar things, they could profit by those neighbors' mistakes; they did not have to experiment; they simply adopted that which had proven itself to be of value elsewhere.

Next after this pair of so-called mechanical features there may be considered a pair of institutions. He was right who said that "The American people are the most widely newspaper-read and the most thoroughly public-schooled of any people in the world." He would further have been right if he had gone farther and said that this is more true in the West than it is in the East. Indeed, one of the things that most of all surprises one is the efficiency of its working in the *Public School System* in the West and the dignified place that institution holds in the opinion of the people. It has always been and still is in cities of the second, third and fourth class that the public school system of the country is seen at its best. The teaching force, on

the one hand, is better, and the patronage of the best people, on the other hand, is more hearty. The teachers are better, in part because they are better paid and in part because that there the "teacher" has a higher social status, and the profession therefore attracts more competent and more ambitious men and women. The schools themselves are better, both ward and high schools, because that in these cities they are practically the only schools. The best people of the city, therefore, stand back of them; their interest is keen in the work that these do for their children, and that because private schools have not as yet divided with the public schools these people's interest.

The second of this pair of "institutions" is *the Press*. This is a delicate point, for the East is especially proud of it daily press. The unabridged, unvarnished truth, however, is that the daily papers of the big cities of the West and Far West are ahead of those in the East and Far East in that their interests are more general and in that they have a better sense of perspective. Contrast the front pages of the New York City dailies, for example, with those of Chicago, Denver, St. Louis, Salt Lake City or San Francisco, and what I have in mind becomes apparent. Here interests are much more local; pride is more provincial. Three columns of a front page will be given up to a yacht race, merely because it occurs in New York Harbor; while the great things of the country, its crops, its irrigation problems, even its legislation, are subordinated and localized. News from those quarters—merely because from there—is likely to be reduced in space by city editors here to single sticks and relegated in position to mere footnotes, unless it be some so-called "shocking" thing—a murder, a strike, or a lynching—which in reality is usually an unimportant one. In the larger newspapers of the greater West the opposite policy is more nearly pursued. There news is more likely to be considered of importance and to be given prominence commensurate, not with its bearing upon local or provincial life, but according as it is considered "news" from the larger point of view of general or national interest.

And there are still two other things. This pair may be called institutions, but only in the highest sense; they might be more accurately called, perhaps, traits of national life. I am thinking of the Church and the State, of the *Religion and the Patriotism* of the West and the East.

There is an old saying that "There is no God west of the Missouri River." The fact is, however, what I was surprised at most was not the absence of churches, but their presence; not their scarcity, but their abundance. In little towns which stand all dotted through the West, looking like troops of Falstaff's soldiers with their dozen private members toeing each one with exact precision the straight line of a single street, and facing the railway as tho drawn up to present arms on a dress parade, one will see invariably one store, one post-office, one school house, a "Palace Hotel"—and always a church. The practice seems to prevail of having such an edifice, no matter how small the community or how isolated from other communities. In size they range from tiny chapels all the way up to those magnificent ecclesiastical structures of many of the great cities, buildings which, as mere edifices alone, would do credit to Fifth Avenue.

How many people are in them? I do not know. I do know, however, that in just the same way that railroads and other institutions are, they, too, are on the ground in time, ready, waiting to receive and serve the coming growth of population. Even tho they may be subsidized by Eastern capital in the form of "home mission" appropriations, they differ not at all in this respect from other things. There are railroads, for example, on which there is only a weekly, bi-weekly or tri-weekly service, just as there are, I suppose, churches in which there is but one service a month and one pastor to three congregations. On one of those very roads, in sight of some of those very churches, I rode one day for four hours, one of only three passengers in a whole Pullman coach. That coach did not pay for its carrying over that section, and yet it was carried, and it will be carried until the traffic on that road will fill it. And it will have paid to do it. So of the churches.

Secondly, *their Patriotism*. The pa-

triotism of the West may not be greater in amount than that of the East; it may not be even of a better type if put to the test of dying for one's country; but the principles which prompt its exhibition are more nearly basal principles. The difference is simply this: in the West the great questions of national policy, national defense and national honor are considered on their own merits solely, not always apart from passion, to be sure, but always apart from secondary conditions. The consideration of them is less mercenary, less selfish, than it is likely to be in the East; it takes into account fewer commercial, financial or business considerations; it does not see the National Capital through the vista of Wall Street.

This may be for two reasons: it may be due first to the fact that the Westerner is more likely than the Easterner to be himself a landowner, to live on his own estate, to own the ground under his feet and to gain his subsistence from the soil at first hand. This being the case, cataclysms and catastrophies of state are likely to affect his income only slightly; whereas, in the East, fewer men are property holders and more men derive their income from, as well as have their money invested in, business enterprises which would be the first to suffer. Secondly, men in the West, living further inland, far away from the seaboard, feel in less danger, indeed in no danger at all, of attack; they know that their business and their positions could never suffer from invasion, and consequently have that sense of security which goes along with isolation and which in its turn breeds independence.

Contrasts in Men and Manners.—First of all, the thing that strikes one about the people of the West is their *bigness.* This has already struck him regarding the land itself. He decides that the very practice of living in sight of such stupendous things is enough to make men broad and generous in their thoughts and sympathies as well as big in stature. It is an old theory that the conditions of life, of climate and of nourishment in the West conduce to largeness of physical stature among those who live there; but one also comes to realize that the outlook on such broad expanses of prairie, plain and mountain slope have of themselves bred great ideas and begotten great enthusiasms; that they have of themselves conduced to strength in terms of mental vigor and to generosity and charity in terms of broad outlook. The very terms in which men in the West appear to think of things and the very language in which they express themselves are larger than in the East. For example, if one there speaks of direction, it will always be in terms of north, south, east or west; things seemingly have no relation to each other subordinately, but are all determined in direction by relation rather to the stars. If the porters and the brakemen on the trains are asked how far away a thing is or how long we will be reaching it, their reply, "Oh, just a little way," or "Just a little while," which in the East would mean ten miles or ten minutes, there as like as not will mean a hundred miles or two hours' time. The very names the people give things, too, are interesting; the way they give a small name to a huge object: a mountain is always a "hill," a cyclone is only a "blow," a canal is a "ditch," cattle roam in "bunches," sheep in "bands," and farms are measured, not in acres, but in "sections."

As a second general thing it is interesting to compare the *industry* of the average man East and West. One of the first things that struck me there was the abounding industry of the people. Every man seems willing to work, and, so far as I could observe, every man has the chance. They have little patience with the man who idles, so little, indeed, that they revert to that very primitive, very simple method of the bees of the hive: the drone may simply starve for all they care. As a consequence he must either never have arrived or else he must have starved literally; for I certainly did not see him. In all the two months that I moved about the railroads, ranches and mining camps and walked the streets of those cities I was not once accosted by a single man on the street who told the story so familiar on the streets of Eastern cities—told by those who try to borrow ten cents for a sandwich or a night's lodging. This fact is most significant. A man moving about the streets of New York for the same length of time would have been approached in this way by fully a thousand people.

To be sure, there is also a striking ab-

sence of very well dressed or very wealthy looking people. This simply means that, in their process of social stratification, they have not yet reached either extreme. There is no very wealthy class; there is no very poor class. The great body of the population belongs to that greater, even tho it should be less pretentious, middle class between these two extremes. But that middle class there, it is plain, is a better class than the same class East. Perhaps only better appearing, and that, perhaps, only because better dressed, and this, once again, perhaps, because the prevailing rates of wages are upon the average higher.

There is a third general trait, the nature of which it is difficult to make clear and the importance of which it is still more difficult to make impressive, yet it is important. As nearly as I can phrase it, it is the *genuineness* of the people. One has all his life heard of the "frankly natural, unrepressed people of the West." This simply means that they are what they seem and have not learned how to seem what they are not. There is noticeable an absence of pretense, a willingness to be thought poor if they are poor and an equal willingness to be known as rich when rich. Nor is a man there reckoned great—certainly not as here—because of what he has, any more than because of what he is or what he knows. His fellows argue, and that logically, that his fortune may disappear, as maybe it appeared, over night. They likewise reason that what he was before he came West does not count; this would be a case of the cackling of the geese that saved Rome. The only thing they take account of and the only process which is ever applied in the reckoning of a man's importance is, not what he was and not what he has, but what he can do. The supposition is that he may suddenly "go broke," but that if so, if he can do something, of this he need have not much dread, and for having had this experience only slight regret. If his worth is in himself, the opportunities lie all about him to begin over again and, inasmuch as his chief asset is his labor, he has equal chance again with every other man.

And not only did I notice this, which seemed to be straightforward honesty in the giving of impressions, but, as well, great honesty in dealing. There is a marked absence, certainly among the wage-earning class, among clerks and employees, of that temper and spirit of "smartness" and flippancy so noticeable in the East. The prevailing feeling on the part of these folk seems to be that they are getting rich fast enough honestly, and that to trifle, cheat or lie would simply be a waste of time. They seem to have learned that one cannot get rich honestly and dishonestly at the same time, and they seem to have chosen out of sheer policy to take the former course.

There is one other trait which it is equally hard to define, but which is equally noticeable in the West: It is what, if one might coin a word, might be called the *approachableness* of the average man in the average position of responsibility or service. I think it goes without saying that in the East the underlying temper in determining any attitude toward any stranger is the temper of suspicion; men take it for granted that the other man is trying to "do" them, that he must be checkmated and that the person interviewed must be on his guard against the interviewer. In the West the very opposite of this seems to be the temper. Every man who approaches a stranger is taken to be honest until he proves himself to be otherwise. This proof may come, of course, but the other thing is given a chance to come first. There is a striking willingness to take up any matter on its own ground, to pass judgment on a thing for its own sake, and for a man to consider it on its own merits according to his own judgment, to pass quickly on it and decide regarding it upon this ground.

As a result in part, perhaps, of all these traits one other fact evolves itself—that is, the people of the West are in their daily life *more happy* than those of the East. This is due in part most likely to their greater self-reliance; they are more independent—independent in action, in thought, in social custom, even in dress. Anywhere West of the Missouri River it is strikingly noticeable that there is absolutely no attempt to ape Eastern customs or manners—even fashions or styles. The people are sufficient unto themselves. They know little about New York and care less; its fads and foibles, its prevailing modes and manners, are no

factor in their lives at all. The very stores of such towns are better supplied than the stores of towns of corresponding size far East; for, just because the people are so far off that they must be a law unto themselves, so those who dress and furnish them must be so well equipped in stock that they can supply necessities and even luxuries at first hand.

Another reason for this which I conceive to be the greater happiness of the people West than East may be the small number of social grades or of degrees of social status. No one has yet learned either to look up to or look down upon one another; consequently all are happier. The man in some clerical position who in the East would be nobody, who would be looked down on by those above him and in turn look down on those below him, here has social rank more nearly equal to those both below him and above him. In so far as there is such a thing as an "inner circle" in Western society any man who is a man has *entrée* to it. In one of those Western cities, for example, the man who stood all day behind the desk as clerk at the hotel where I was staying I discovered later passing the plate in the aisle, a vestryman, of the Episcopal Church where the same evening I attended service. All of which is due simply to the absence of extremes in the social order.

I remember some one complaining that the thing he had most noticed in the Western cities was that he "never saw a single gentleman on the street;" the thing that I most noticed was that every man I saw on the street was a gentleman. The difference, I suppose, must all be in the way one looks at it.

NEW YORK CITY.

The East Through Western Eyes

BY EDWIN E. SLOSSON]

[As a companion piece to the preceding article we have asked Dr. E. E. Slosson, who was until recently a citizen of Wyoming, to give us a frank statement of his first impressions of the East; but as the West seems to have the best of it in both points of view, altho they were written without collusion, we must ask our readers if some one will not volunteer to say a good word for the East.—EDITOR.]

TO a man born and bred in the mountains and plains of the interior of our continent a journey to the Far East of the Atlantic seaboard is like going to Europe. In fact, a greater change of mental and social climate is experienced in going from the mountains to the ocean than in going from one side of the ocean to the other. London and New York are more alike than New York and Denver. Freight rates are less by water than by land, and in the communication of ideas the same law seems to hold as in the transportation of goods, that oceans unite and continents hold apart.

The Westerner knows the East through books and family traditions. It is to him a land of history and legend, so he greets with gratified expectancy the buildings and streets, the towns and rivers he has known by name from childhood. But what surprises him is the quaint and curious customs of the people, the survival of ancient usages which he never expected to find out of books, any more than he expected to see a knight in full armor off the stage. As one journeys toward the rising sun he seems to be going backward in some time machine. Whenever he sets his watch ahead an hour he has to set his mind back some years until, by the time he reaches the Atlantic, he feels somewhat like a Connecticut Yankee at King Arthur's court. At each change of railroad the cars get dirtier and more antiquated, the toilet arrangements become inconvenient and indecent, the conductors get crosser and more dictatorial, the porters and waiters more obsequious and avaricious. Money assumes an importance that he had not before assigned to it. To possess it gives

one undreamed of privileges and advantages; to be short of it, even temporarily, brings unforeseen disabilities. Money in the East is not merely a medium of exchange, but a measure of power and determiner of status. I have had to think more and talk more about money in the few months I have been East than in all my life before. It is very pleasant living in an Eastern city if you have enough money. I do not know of any body who has enough money.

What struck me most painfully when I came East was the suspicious and mercenary atmosphere into which I was plunged. Everybody seemed to want to get money out of me or to get me out of the way, one or both. They did not know how little I had of either time or money. Instead of the calm indifference or frank friendliness, such as I anticipated from strangers, I met suspicious glances on every side. If I asked a well-dressed man the time of day he acted as tho I were a pickpocket. If I asked an ill-dressed man the way, he wanted a fee. One naturally has a tendency to become what he is thought to be; so, being taken constantly for a rascal or a millionaire, I would have been tempted to have become one, or both, had I seen my way clear to make a living as either.

In the West people are trying to make money. In the East they are trying to get it away from each other. The Westerner strives to outbeat his neighbor; the Easterner to beat him out. In the West men extend a helping hand to each other; in the East they use their elbows on each other instead. It shows how unfair are hasty judgments of a stranger that at first I blamed the people of the East for acting as tho every other man was trying to cheat them. I have since found that attitude is a necessary one.

Coming from an unfenced land, I was much annoyed by the numerous and perplexing restrictions on personal liberty. I found in the first few days more things that I could not do in New York City than in Berlin, and the police and other public servants here were not so civil about the way they stopped me. I do not like to be yelled at and jerked about. In the West the cow-punchers are very unceremonious in the way they load cattle into the stock cars, but in the East the street cars are loaded with people in the same way. In the West whatever is not forbidden is allowable; in the East, as in Europe, whatever is not expressly permitted is prohibited. In the West the common law prevails that every man is assumed to be innocent until proved guilty, and sometimes afterward. In the East every voluntary act is *à priori* illegal, and the burden of proof that it is not rests upon the perpetrator. In the West they have fewer laws and what they do have are not enforced often enough to bother much.

In Washington Park, Chicago, I saw the sign, "Keep Off the Beaten Path." In Central Park, New York, it was "Keep Off the Grass." In the Art Institute in Chicago I was permitted to set up the tripod of my camera wherever I chose, even before Breton's "Song of the Lark." In the Metropolitan Museum in New York a kind gentleman at the door insisted on taking care of my kodak while I looked at the pictures, evidently thinking my retina kept an impression as well as a celluloid film. At the Zoological Gardens in Chicago I took a lot of photographs at the bear-pit, by that act affording amusement to both the bears and the spectators; but at the Zoological Gardens in New York the gatemen captured my camera in order to make me buy the ready-made photographs on the grounds. That is the way it is in the East. They are always wanting to do things for you that you want to do yourself. Very likely it is true, as they claim, that they can do them better, but where is the fun for you if they can?

If liberty is minimized in the East, the second of the three social graces, equality, seems to be not less despitefully used. The Westerner finds it hard to get used to the prevailing caste system, which he had supposed was purely an exotic. In the West social association is determined by similarity of taste and interests, not by occupation and wealth. A locomotive engineer there gets more money than a college professor, but nevertheless he treats the latter on the plane of equality. In the East the men, and especially the women, try hard to keep themselves, and other people, in their proper stations. A lady cannot associate with persons above and will not with those beneath

her; consequently she has to keep to her own flat. Those who are so unfortunate as to exist between the 400 and the tenements seem to have no available form of social intercourse. Between the snobs and the snubs their life is a sad one.

Olive Schreiner, in one of her dreams, tells of a country where all men fear each other. She does not say what country it is, but she probably means New York City, at least it answers that description better than any place I have seen yet. By their attitude toward each other one would think that Easterners were all charged with the same kind of electricity. Before I froze up, too, I used to try to make myself agreeable to gentlemen and ladies I met on trains and sidewalks, who seemed desirable acquaintances, but the two or three men who were companionable and talkable turned out to be drunk; the rest thought I was.

In the East people unite in order to separate. They form cliques, classes and clubs for the avowed purposes of emphasizing the things which now divide them. I had supposed that the first step toward the obliteration of class lines was to ignore them, but I find that many of my Eastern friends think that the cultivation of "class consciousness" is a virtue. This is hard to acquire. When I give a man a tip I always feel as tho I were slapping him in the face, but I find here many men who wish to be slapped and when so treated piously turn the other cheek. The embarrassing mistakes that a stranger makes in treating a Brahman like a Sudra and *vice versa* would be avoidable if they would only put the proper brands on their foreheads.

Race prejudices are assiduously cultivated in the East, and Old World feuds grow luxuriantly when transplanted to this new soil. In the West Irish and Italian, Catholic and Protestant, Jew and Gentile, study together, live together, work together and marry each other; all proud of being Americans and nothing more.

In particular I am surprised and puzzled at the general antipathy felt in the East toward the Jews. I have many friends of the Hebrew race, and I shall have to add more than a cubit to the stature of my conceit before I can look down on them. As for cultivating the fashionable aversion for them, I give up that task in advance as altogether impossible. But here I find that many people regard the race with a curious mixture of despite and dread, for either of which feelings I have not as yet found any justification. Nobody has made it clear to me why the "invasion" of certain streets, colleges, hotels and lines of business by Jews should be regarded as objectionable. But it seems to be true that the further one goes east the nearer he gets to Kishenef.

Still harder for me to understand is the treatment accorded to women in the East. I find women are regarded somewhat as negroes are in the South, as inferior animals, useful, but very dangerous, both weaker and more powerful than the male sex. It is almost the same view of women as was held by the church fathers, but I do not find that the Ante-Nicene sermons are much read. All sorts of efforts are made to prevent women assuming a position of equality with men. The men regard them as inferior in strength and cleverness, yet they are afraid to allow them to enter certain occupations for fear of their competition. They say that women are inferior in mental capacity, yet refuse them the opportunity of developing what brains they have at the universities. The men praise the women for their social qualities and conversational powers, yet they exclude them from their clubs. The men talk of the superior moral character of the women and yet deprive them of the right to vote.

All these apparent illogicalities are extremely difficult for a stranger to comprehend. I have troubled my friends with many questions about them, but without getting the clue. None of them will explain, simply enough for me to understand, why they allow an ignorant, worthless and wicked man to vote, and exclude an intelligent, capable and virtuous woman. For the last three Presidential elections my wife and I have cast our votes together, tho not always for the same candidates, and it does not seem right to me that I must now leave her at home when I go to the polls, since she has the same education, reads the same papers and has more sense than I have.

This contempt for women shows itself

in many other ways. In getting on the cars the men push the women to one side or knock them down in a way that is quite distressing to one who is not used to it. As nature provides the necessary organs for the struggle of life, the women of Eastern cities have developed elbows of extraordinary sharpness, actuated by powerful muscles. On the cars the women stand while the men sit. This masculine habit is not so hard to acquire as I thought at first. I can do it now if I have a newspaper. In a few more months of practice I think I can sit and stare at them as they dangle on the straps in front of me.

A man coming into an Eastern city by a night train is received in almost any of the hotels. A woman under these circumstances is admitted to only a few decent hotels, and if she fails to find one of these she is forced to walk the streets all night or go to a disreputable house. If it were the other way around it would be equally absurd, but would not work such hardships. I do not think it is proper to force a woman to choose between spending the night on a park bench or in a Raines Law hotel. The paths by which a woman can advance upward toward a fuller and nobler life are more or less hedged and barred by customs and laws; the paths downward are opened and greased.

Then there is the chaperonage system which is very prevalent in the East. It is for women something like the muzzle law for dogs. The inevitable result is the double standard of morals. How can a young man have any respect for a girl when he knows her own mother dare not trust her out of her sight? What respect can a girl have for a young man when she knows that she must be thus guarded from him? And can there be true love when there is not previously respect? It seems to me that in this is to be found the root of much of the evil I see here.

New York people tell me that women here are of such a character that it would be ruinous to society to allow them greater liberty. Of course I do not know enough about the subject yet to contradict them. But there is a saying that each country has the sort of Jews which it deserves by its treatment of them, and perhaps the same thing is true of women.

There seems to be a lack in the East of that community of interest and public spirit which is characteristic of the West. There the word "public" as applied to institutions, offices, buildings, museums, parks, assemblies, libraries, schools and the like has a noble and attractive sound. In the East it is a degrading adjective. In the West the public library is the pride of the town. In New York I find it is not the proper thing at all to know where the circulating libraries are. In the West if a boy or girl does not attend the public schools the parents are careful always to explain why, or it would be inferred that their son or daughter was feeble-minded or incorrigible. The public school is usually the largest and handsomest building in Western towns. In the East the country schools are often very poor, and the city schools do not accommodate those who wish to go to them. I am told that the moral and mental atmosphere of the public schools of New York City is so bad that all respectable parents who can afford it send their children to private schools. If this is so it seems to imply that the poorer and less reputable classes are the better citizens. Would it not improve the public schools if the children who have the best home training were sent to them? I wonder what is the object of all these attempts to convert the social crevices into crevasses.

I have put down here merely my personal impressions of Eastern life and institutions, well aware of the danger of generalization from superficial observations. Therefore I do not wish to be understood as finding fault with anything. Very likely there are good reasons for all that seems to me questionable. *Tout comprendre c'est tout pardonner.* One thing at first puzzled me—that was, why Eastern people still profess to be true to our republican ideals of liberty, equality and fraternity while at the same time working so hard against them. I see now it is not hypocrisy, it is merely that they do not know what any of these words mean.

New York City

Future Government in the Philippines

BY ANTONIO REGIDOR Y JURADO

[Dr. Regidor was born in the Philippines, and held high judicial office there under the Spanish Government. He was banished for participating in the 1873 revolution, and has since resided in London. He is a lawyer of high standing, and has been a lecturer on law at the Madrid Royal Academy of Jurisprudence and Legislation. He has been asked by his friends in the Philippines to assist in the work of framing a self-government platform for submission to the United States, and his ideas on the subject are contained in the present interview, which is of especial timeliness just now in view of the planks of the Republican and Democratic parties on Philippine independence. The interview was obtained for THE INDEPENDENT by Mr. J. Warren T. Mason.—EDITOR.]

IT must come to pass, sooner or later, and probably within the lifetime of the next American Administration at Washington, that the United States will extend, of its own volition, some measure of self-government to the Philippine Islands. That this will lead to further steps in the same direction I am convinced, but it does not seem to me that whatever be the result of the American Presidential elections this year, or any other year, full independence, in the same manner that the United States, or England, or France is independent, will ever fall to the lot of the Filipinos. If it should, owing to the present code of international morality, the effect would be disastrous for the Philippines. Left to struggle single handed against the imperialist ambitions of the world's monarchies, the Archipelago would ultimately fall a victim to Japan, to Germany, or to Great Britain, or, most probable of all, to Japan and Great Britain jointly.

It seems to me, therefore, that no Filipino is lacking in patriotism who confesses to a conviction that the United States for the future must be predominant in the Philippines, in the same manner that a Cuban must confess to the predominance of American influence in his own country. This admission is becoming more and more general among those Filipinos of education, to whom their countrymen must look for guidance if they are to qualify before the bar of American public opinion for that certificate of capacity for self-government the issuance of which must, and should, precede the granting of local legislative rights.

The Filipinos are now, as they have been since the American occupation, divided into three parties on the question of the future status of their country. There is the Federal Party, whose leader is Dr. Pardo, the President of the Filipino Commission that paid a visit to President Roosevelt this summer. Its platform consists of frank admission of America's rights to the Archipelago and of the permanency of American sovereignty. There is the Conservative Party, now reaching a moribund state, whose most eminent member was Dr. Arellano, Chief Justice of the Islands, also a member of the Filipino Commission, and whose present leader is Dr. Barrera. Its platform is pro-Spanish and pro-Clerical. Its members are among those Filipinos, mostly with a predominant amount of Spanish blood in their veins, who never sympathized with the revolt of the natives against Spanish rule, and whose wish has been to witness the re-establishment of Spanish sovereignty at Manila. The absurdity of this desire is now being so generally recognized that the Conservatives are ceasing to extend their propaganda, and their organization is rapidly decaying, the members assuming various attitudes of independent action.

There remains the third party, the party of Independence. To it belong most of the Filipinos, and before there can be permanent peace in the Islands its supporters must be placated. The Independence Party is divided into two sections. The first numbers those few Filipinos who have left the Islands, such as Señor Agoncillo and Señor Sixto Lopez, and who, denied readmission unless they swear allegiance to the United States, have become, to all intents and purposes, irreconcilables, and blind to everything but their demand for full

sovereign independence. The second section numbers those who are conducting either an active or a passive resistence to American occupancy within the Islands themselves, but who will, I believe, give recognition to American superior rights if the case is properly placed before them and their prejudices left to be pronounced false by experience.

It is for this section of the Independents that I wish to speak, and if I hold a brief at all, unofficial and self-given, it is for them. They are the mass of the people. It is with them that must rest the question whether the future government at Manila is to be democratic or oligarchic. It is a question, too, as important to America as to the Philippines, for lack of sympathy between father and son reacts on the character of both and indicates defects in the former as well as in the latter.

The Independence Party in the Philippines has one serious fault: It is without any definite platform. It says, only let us be free and the rest will follow. This may be well when a country is able to establish its freedom by might, but it can never be profitable when freedom must come as an act of grace. The queries of those in whose hands the gift of freedom rests are: What will you do with this gift? Have you given thought to its magnitude and to the care with which it must be handled? Are you able to preserve it? And last, but by no means least, where do we come in? It is my desire to answer these questions, not in detail, but in general outline, with the hope that those to whom power will come with the American November elections may find the answers suggestive.

I take for granted that the Philippine Islands cannot hope to receive, within any time that it is practicable to take into present consideration, Statehood rights, as one of the integral units of the United States. The Filipinos, living on the other side of the world, can never enter intimately into the local ambitions and desires of the United States except, perhaps, after generations of intermarriage; and a group of forty or fifty Filipino Congressmen, assisting to legislate at Washington, would consider themselves, and would be considered, almost as aliens. This being so, it would strike a false note to offer to extend to the Philippines the American Territorial form of government, for it, by the law of custom, is but a preliminary condition to the granting of complete Statehood; and if the latter is never to come, the former should, likewise, be withheld.

It becomes necessary, then, to look without the United States for a form of government for the Archipelago. Naturally, Great Britain, as the most extensive and democratic of the world's empires, attracts attention as possibly possessing an acceptable model. I do not believe, however, there is anything within the British Empire that will suit the case. To construct in the Philippines a form of government similar to the British crown colony type would be unjust to the Filipinos, as it would give them too little self-government; to adopt the legislative machinery of the British self-governing colony would be unjust to the United States, for it would give the Archipelago greater absolute rights than exist in Cuba.

It is suggested that the relations existing between Cuba and the United States might be copied in the case of the Philippines. The result, however, would be unsatisfactory for geographical reasons. Cuba, separated from American shores by a narrow stretch of water, can be well regulated from Washington without the necessity for any special governing machinery; but the Philippines, having the wide Pacific between them and the United States, could not practically lend themselves to the exercise of that unofficial but none the less paternally rigid overlordship at Washington, and friction would be constant.

I believe it necessary to evolve a new form of government for the Philippines, with the object of granting to them an outward state of independence, but at the same time giving very considerable rights to the United States, rights so strong and so definite as to make America the suzerain Power. The exercise of this suzerainty should be of much wider scope than is the case with Cuba, for the Philippines will owe more to America than does Cuba, and the greater the debt the greater the payment. Cuba is safe from European molestation, owing to the Monroe Doctrine, and the protection afforded the Island Republic is purely an

act of self-interest on the part of the United States, for, by guarding Cuba America is but guarding herself. With the Philippines it is different. It would not be of vital concern to the United States if a European Power should succeed in obtaining the Philippines, and hence, if America acts as the protector of the Archipelago, she should naturally look for substantial reimbursement.

I believe it will do no harm, but will be of good consequences, to start with a fiction, the same kind of fiction—and I do not speak in an offensive sense—that is contained in the Declaration of Independence: "All men are born equal." Let there be agreement as to the equality of the Filipino and the American, and let there be granted to the Philippines a republican form of government, "independent," as Egypt is "independent." There can be no difficulty in finding a name, and, for want of a better, call the Islands the Philippines Commonwealth. Professor Bryce has designated the United States the "American Commonwealth," and England has named her great island colony the "Australian Commonwealth." The Philippines Commonwealth can, therefore, be as close to or as distant from sovereignty as suits the individual, in so far as the name is concerned.

The Philippines Commonwealth should have a constitution, providing for legislative, executive and judicial machinery. It should have a distinctive flag, a national system of coinage, and an army and navy, if the citizens of the Commonwealth desire it. It should be permitted to enter into consular intercourse with the nations of the world, and, in fact, should be granted, on paper, all rights that pertain to sovereignty. The Chief Magistrate may be named the President, or the Governor, or, if prejudice will not allow of either, then simply the Chief Magistrate. The area of the Archipelago should be divided into departments, and while there should be local self-government within the Islands, it would be wise, in the interest of better control, to make all local government subordinate to the Department of the Interior of the general Government, as is done in France.

All the machinery of the Commonwealth should be supervised by an American, appointed from Washington, and called the American Envoy and Minister Extraordinary, or the American Resident. It should be his duty to watch after American interests, and every act of the Commonwealth's Government should have his consent before becoming valid. It would not be wise, however, to make his veto absolute. If a measure did not meet with his approval, the Commonwealth should have the right to appeal, if it desires, direct to Washington, for consideration there. The American Congress itself should have final jurisdiction, in absolute fact, and not in theory, such as the British Parliament has over the acts of all the British colonies. The American Envoy at Manila should have the right to demand legislative enactments by the Philippine Government, and if he is met by a refusal, appeal should also be made to the American Congress for a decision, which should be final. Thus, the American Envoy would possess the rights of the Referendum and Initiative, embodying in himself the powers that the citizens of Switzerland possess, while the American Congress would be the arbitrator in cases of dispute.

The Filipinos should be designated as citizens of the Philippines Commonwealth, which will obviate the awkward necessity of the United States refusing to consider them American citizens and at the same time declining to admit they are American subjects. American citizens in the Islands should have all the rights of Filipino citizens. They should be permitted to hold any office to which they may be elected or appointed, and should be allowed to vote under the same restrictions imposed on native citizens. The only qualification for local citizenship by Americans should be a brief residential limit, say six months. Otherwise there would be injustice, for it would be manifestly unfair to give a vote to an American citizen paying but a short visit to the Islands, as a sailor, for instance, who should, by coincidence, arrive at Manila just as an election was taking place.

Any difference between America and the Philippines concerning the interpretation of the Commonwealth Constitution should be referred to the United States Supreme Court for settlement.

whose decision should be final. Americans in the Islands should be tried for civil and criminal offenses before the local courts, and, on recommendation of the American Envoy, whose decision in this matter should be final, an appeal should be allowed to the United States Federal Courts.

This, in general outline, is the plan I have to propose for the future government of the Philippines. Lack of space causes the absence of details, which is of no great matter, for they can be inserted in the general scheme only after a conference of the Powers. I believe the groundwork I have sketched above to be eminently fair to the United States, while at the same time enabling the Filipinos to work out their civic salvation for themselves. The power given the American Federal Government would be far greater than the power of England over Canada, and there is no conceivable American interest that could suffer. The United States could have naval and military stations in the Islands by a simple legislative enactment at Manila, or, failing that, at Washington. The Philippines tariff could be regulated similarly, and the foreign affairs of the Archipelago could not possibly involve the United States if the American Envoy at Manila exerted his veto power on any contemplated act that might adversely concern his country.

America in all things would have predominant rights, and the Filipinos would have to trust to the benevolence and good will of the United States. I believe they could do so with full confidence in the outcome, and thus do I think a settlement can be reached acceptable to both sides and with justice to each.

London, England.

A Perilous Climb

ASCENT OF THE BHAYAKARA LA IN BALTISTAN

BY WILLIAM HUNTER WORKMAN

[Dr. Workman is the well-known traveler and author who has made such extensive ascents of the various Himalaya mountains. With his wife, Fanny Bullock Workman, he is the joint author of "In the Ice World of Himalaya."—Editor.]

EARLY in the afternoon of the 20th of August, 1902, our party, consisting of Mrs. Fanny Bullock Workman, the writer; Mattia Zurbriggen, guide, and Giuseppe Muller, porter, having finished our exploration and first ascent of the upper northwest branch of the great Chogo Lungma glacier, reached the base of the cirque of high mountains which give it birth, the highest of which is the fixed peak measured by the Indian Trigonometrical Survey at 24,470 feet and known in the records of the Survey as "Indus Nagar Watershed Peak No. 2."

The day had been oppressively hot. The high mountain walls inclosing the glacier shut off all breezes, and the sun burned with fiery fervor through a film of cirro-stratus clouds. The heat reflected from the dazzling white covering of recently fallen snow struck us like the radiation from a blast furnace, blistering our noses, cheeks and foreheads, already burned to a deep copper red. The temperature in the sun at one o'clock, even through the thin clouds, as registered by the black bulb thermometer, was 183° Fahr. During the last three hours of the climb the glacier had a sharply ascending gradient and was much crevassed.

At two p.m. we pitched our tents on a small snow-covered section of glacier, surrounded on three sides by wide crevasses at a hight of 17,500 feet (determined by hypsometric readings compared with simultaneous ones of the Government mercurial barometer at the lower station of Skardo). This camp we named Crevasse Camp. It was safe from avalanches, but we could not have moved many yards from our tents after dark with safety.

The mountains rose around us in tremendous unscalable precipices. There was only one point which gave promise

of a peep at the beyond, and that after the ascent of a steep avalanche scored snow wall 1,760 feet high, leading to two cols, or saddles, one on either side of a perpendicular rock ridge rising a thousand feet or more above them.

Wishing to learn what lay beyond that ridge, we determined to accept the gauntlet which this wall threw down to us and attempt its conquest. The night of the 20th was clear and cold. The minimum temperature was 12° Fahr., which was favorable, as it hardened the snow. On account of the crevasses we waited till daylight of the 21st to start.

Our path at first lay over the steeply ascending crevassed glacier, then up the still steeper *débris* of avalanches that had fallen two days before. Above this came a wide *Bergschrund,* over which we found but a single insecure snow bridge. This passed in safety, we had before us the ice wall, which gave us all the work we cared to do for the remainder of the day. This wall was steep from first to last, varying in different parts a few degrees either way from 60°. On the ascent every step had to be cut from bottom to top, as the wall, being on the east side of the valley, did not feel the force of the sun's rays till about eleven o'clock, and its surface remained hard till noon.

We had intended to strike directly from the last projecting rock to the right hand saddle, which, tho not so high as the other, was much nearer our route, but on leaving the rock we found the slant at this part to consist of smooth solid ice of 60° incline, thinly covered with fresh snow and too dangerous to attempt.

We, therefore, decided to turn to the left, where the snow was deeper and the foothold better, gain the base of the rock ridge as soon as possible, and, with what hand-holds it might afford, traverse the upper edge of the ice slant where it joined the rock face, and thus reach the left hand saddle.

After another hour and a half of laborious step cutting we got to the base of the rock ridge, which was found to consist of rotten and crumbling sandstone so weathered away as to afford but few hand-holds, and what few there were had to be used with the greatest caution lest they should scale off.

The upper sharp edge of the ice-slant did not lie close against the rock, but was separated from it by an interval, or *Schrund,* varying from a few inches to two feet or more in width and of unknown depth. The steps cut along this edge made a more precarious foothold even than those on the steep slant, and in the absence of hand-holds progress was necessarily very slow.

To add to the difficulty transverse crevasses existed at intervals, some of them covered with snow, into which there was danger of falling. It was a most uncanny path over which we cautiously pursued our way for more than two hours. At last, at one o'clock, we reached the col, a sharp edge with a slant on the farther side steeper than that by which we had ascended, ending in a precipice, which overhung a large glacial ice fall.

It overlooked a vast trefoil glacial basin, surrounded by massive ragged mountains, which cut off all view beyond and sent down a complex of glaciers and ice falls to form a large glacial branch of the Chogo Lungma, which we afterward explored almost to the top of its highest ice-fall. There was barely standing room and no opportunity to take hypsometric readings, so we had to rely on the readings of our Watkin aneroids, which had been checked the previous afternoon by the boiling point thermometers. One of the aneroids differed from the latter by only + .01 inch. The corrected readings, compared with those at the same hour at Skardo, made the hight of the col 19,260 feet, 1,760 feet above our camp. The difficulty of the ascent can be judged by the fact that only 251 feet of altitude per hour were made.

For the last two hours the midday sun had shone upon us and, crowded as we were against the rock wall, the heat was almost unendurable as well as enervating. The temperature in the shade could not be obtained, as there was no shade except that cast by our bodies. In our shadow the temperature was 80°, but the sun burned from a cloudless sky with greater power than on the previous day.

Its rays struck with savage energy perpendicularly upon the ice-slant and by this time had softened its covering of snow. We did not remain long at the col, partly because there was no comfortable standing place and partly because we were anxious about the descent.

It was evident that owing to the soft-

ened snow the latter would be more dangerous than the ascent. The steps, cut with so much care, no longer afforded a firm foothold; our feet sank into them from a few inches to two feet, till stopped by the solid ice beneath.

We returned slowly and painfully along the treacherous edge in the pitiless heat of the sun, finding neither handholds nor satisfactory ax-holds. Every now and again some one would slip on an insecure place. After going a short distance Zurbriggen said: "Es ist sehr gefährlich. Wir Kommen heute nicht hinunter." This was the first time we had known him to lose courage in two summers of difficult mountaineering.

We replied: "If we do not get down to-day we shall not get down alive." Whatever might be in store for us on the descent, to remain where we were would be certain death. No shelter of any kind was to be found on that ice-slant. There was not even a place where one could sit down to rest. We should be obliged to stand in the narrow steps on which our feet rested till we dropped with fatigue, which would mean a slide of some 2,000 feet down the avalanche gullied ice flank into eternity. Could we manage to stand there we should be frozen stiff in our tracks before morning, as the temperature would drop to zero. With such a prospect before us nothing remained but to go on and take our chances.

It was now two o'clock, and having eaten nothing since eight a.m., we were becoming faint. There had been and was no opportunity to take a comfortable lunch. We stopped in our tracks, took out from our pockets what kola biscuit and chocolait happened to be accessible, as well as a stray tin of *pain*, off which we made a hurried meal, and then crept forward again.

Shortly after this the porter, who was between Mrs. Workman and myself, lost his footing and slid down eight or ten feet. Zurbriggen, who was last on the rope, happened to have his ice-ax fixed in a narrow crevasse and the rope around it, so he was able to hold firmly. I, who was leading, altho I had only one foot secure on a narrow ice step, had a fairly good hold on the edge of the ice with the blade of my ax, which enable me to keep my balance. The porter being thus supported at both ends quickly regained his feet. Had the whole strain come upon me I should undoubtedly have been pulled off.

When we came to the place where our path from below joined that along the rock face we considered it imprudent to follow the former, which led diagonally down over the ice slope, for fear of starting an avalanche. So we decided to go straight down backward, so as to be able to tread out the steps better, all treading in the tracks of the first. Zurbriggen fixed his ax firmly and secured the rope to it to hold us in case of accident.

The porter now led down to the length of rope between him and myself. When he had placed himself safely I followed, treading exacting in his steps. In the same manner Mrs. Workman followed me, and when all three were placed as well as possible Zurbriggen descended and braced himself anew.

In this manner we made a tedious descent to some rocks below, from which we were able to regain our line of ascent. It being now five o'clock and the sun having sunk behind the opposite mountains, the snow soon stiffened sufficiently to permit of our resuming the forward position, and, altho we sank into the snow above our knees at every step, we arrived without accident at the *Bergschrund*. Here the snow bridge was found to be so soft that we did not venture to use it, but jumped the *Schrund* into the soft snow below and reached camp after six o'clock, having had twelve hours of continuous mental and physical tension. We did not sit down to rest once during the day and there was no place after the ice slope was reached where we could have rested had we been so disposed.

Zurbriggen called this the most difficult col he had ever made. The effect of altitude was added to the difficulties of a purely alpinistic character. Above 17,000 feet the resistance of most persons to fatigue is distinctly lessened and a march or climb of six hours is felt as much as one of the same character of double that length at lower altitudes.

We named the col the Bhayakara La from the Sanscrit word for perilous.

Srinagar, Kashmir.

Literature

Rossetti

Mr. Benson, the latest writer on Rossetti,* the man, the poet and the artist, has at once the great advantage and disadvantage of dealing with a subject already treated with care and sympathy by commanding writers—Sharp, Swinburne, Watts, Pater, Myers, Garnett, Hall Caine and Birkbeck Hill, to name but few among them, and we cannot omit Michael Rossetti, who has united devotion and notable literary gifts in his editorial and biographical works. All these authorities have been carefully used, yet Mr. Benson has maintained individual judgment, guided by clear insight. Indeed, he has, by his earlier appreciative analysis of Christina Rossetti's work, shown his peculiar fitness to write what may be regarded as a final critical biography of her greater brother.

Rossetti was quite the center and commanding genius of the famous Pre-Raphaelites in their revolt against the slavery of art, tho not the founder of the brotherhood. This was to be expected from the sheer force of the man coupled with his inheritance of mysticism and love of the Italian genius. From Blake alone of Englishmen did the group draw good, and of power they might well have taken more. The movement is well characterized:

"In fact, it may be said that it was the fidelity and simplicity of early art, rather than its archaic character, which attracted the brotherhood. . . . It is clear that this band of enthusiasts were men of untainted lives, and tho they probably had little respect for purely conventional morality, they had a deep-seated desire for nobility of life and aim. . . . The *Germ* is all fragrant of sincere and enthusiastic youth and artistic purpose. It suggests a whole background of ardent, impulsive figures, inspired by a generous emotion and determined to see things with their own eyes and to say them in their own way."

And using Blake, Leonardo, Giotto and Dante as inspirations, not as mere models, Rossetti did paint and write despite Ruskin's fussy and anxious patronage, which is as amusing in its way as is that of Chesterfield over Johnson.

Here with firm strokes and fine is drawn the character of Rossetti, a man instinct with life and energy and vision, not a morbid dreamer, as many have thought. Rossetti's debt to civilization is as well acknowledged as civilization's debt to him is asserted. Mr. Benson speaks with the utter frankness of informed duty. The details of life and habits and character—all the misfortunes, within and without, that held Rossetti to earth—have been given to the public in fullest accord with the grasping communism of literature, and therefore they are here dealt with in candor. For significance, not curiosity, have anecdotes been given. To disturb so fine a conclusion as this when we are all seeking inspiration to hang on the walls would be a pity:

"It was in the gnomic poem of *Soothsay* that Rossetti wrote his deliberate creed out: to mistrust the certainties of human knowledge, but to believe in nature; to be independent and subservient to no man, not to nurture false hopes, but to be content to have sung truly, and to have been loved; to be consistent, to hate flattery, to be true to friendship, to be liberal, to be laborious, to abhor indolence, not to waste the golden hours; in religion to follow faith rather than dogma; to be grateful, not to waste strength in vain hope or vain regret; so runs the symbol, based upon generosity and love, and wrought into a proud stoicism by sad experience."

The reader passes with right equipment to the review of the work of Rossetti in art and letters. Mr. Benson seems to think it a limitation that Rossetti's work is so largely an individual expression. True, it is, and there lies its worth, for there is the assurance and reason for its truth. Had it been more universal and equally sure it would have been so because Rossetti himself was more universal. But universal minds are rare—there were few even in the self-satisfied nineteenth century.

* Rossetti. *By Arthur C. Benson.* New York: The Macmillan Company. (Englishmen of Letters Series.) 75 cents.

Mr. Benson's criticism is acute and flexible and convincing because, while it has the pulse of sympathy, there is no trace of bias in his clear analysis and judgment. The whirling superlative of Swinburne, rightly used in the great defense of thirty years ago, is properly absent when one comes to the decision that Rossetti no longer needs defense, but is one of the immortals to the better few.

The Fall of Feudalism in Ireland

THERE are at least three reasons why Mr. Michael Davitt's new book *—the most ambitious and important of any of his literary undertakings—is welcome and likely to be of service for many years to come. It is the most complete and most comprehensive of any of the numerous books which have been written of the political unrest and popular agitations in Ireland of the last one hundred and fifty years. It embodies the closest study of Parnell which is as yet accessible; for in some respects it tells us more about Parnell than is contained in Mr. Barry O'Brien's biography of the Irish leader. Moreover, Mr. Davitt infuses his strong personality into anything he writes, and for that reason *The Fall of Feudalism in Ireland* is good reading, even to those who are not in sympathy with the aim of the two movements to which Mr. Davitt has given so much of his stormy and eventful life.

The title is apt to convey an erroneous impression. Ireland never had a feudalism like that of England. It never had a civilization like that which has been so graphically described by Miss Bateson in her recently published "Medieval England," and there is about the Irish towns and cities none of the indications of the Feudal Era which characterize the development of town life in England. If Ireland had had a feudalism like that of England there would have been no basis for the Irish land legislation since 1870. But Ireland, like England, was long dominated by a small class, whose social prestige and political power were based on the ownership of large areas of land and the existence of a dependent class, which cultivated the land, and furnished the aristocracy with their wealth.

Mr. Davitt's book is concerned (1) with the partial dislodgment of the Irish landed aristocracy from this position by the radical, almost socialistic, land legislation of the last thirty years, and by the assumption of political power by the farmers and the peasantry; and (2) with the movement for Home Rule, which began in real earnest after Parnell succeeded Butt and Shaw as the political leader of Ireland in 1881, and which grew in strength and intensity after the Irish peasantry had been enfranchised by the reform measures of 1884 and 1885, and were enabled thereby to return eighty-five Home Rulers to the House of Commons.

As might have been expected, the book is written from an avowedly partisan standpoint. Every Irishman who has been at all prominent and loyal to Home Rule and to the Agrarian Movement is described in Mr. Davitt's pages as gifted, great and good; and practically every man who has mounted a platform in Mayo or Kildare or taken the floor in the House of Commons in support of the cause is an orator and a patriot. It is always so in the history of Irish political movements written by Irishmen. It was so in the eighteenth century; it was so in the nineteenth, and it is likely to continue so as long as Ireland has a grievance to be redressed. But it has to be remembered that the only histories we have of the Chartist and Corn Law movements were written by men who were of them, and Mr. Davitt's history of land reform and of the great but as yet abortive struggle for Home Rule will rank as a contribution to history with Archibald Prentice's "History of the Anti-Corn Law League" and Gammage's more recently published "History of the Chartist Movement." Even a student of Irish history who desires to approach it from an objective point of view will find Mr. Davitt's book almost invaluable; for Mr. Davitt has 750 closely printed pages in which to tell his story, and he quotes resolutions, manifestoes, programs, speeches and let-

* THE FALL OF FEUDALISM IN IRELAND; OR, THE STORY OF THE LAND LEAGUE REVOLUTION. *By Michael Davitt.* New York: Harper & Brothers. $2.50.

ters, and gives dates with a fullness and a care which are commendable.

It might have been as well if Mr. Davitt had begun his story with the agitations for complete enfranchisement for the Catholics; against tithes, and for the repeal of the Union, which kept Ireland in a state of turmoil in the interval between the Union and the first Reform Act of 1832. His narrative of agitations in Ireland from the time of Cromwell to Daniel O'Connell is the least satisfactory part of the book. Here Mr. Davitt gives no adequate account of what popular agitation in Ireland wrung from Pitt and George III in the years immediately following the American Revolution. He does little more than mention the great agitations which resulted in Grattan's Parliament and the commercial freedom of Ireland; and he also ignores the long but successful agitation which ended in the enfranchisement of the Catholic forty-shilling freeholders in 1793. Mr. Davitt is at his best after Butt had retired and Shaw had been superseded by Parnell. Then he warms up to his subject, and from his point of view he gives an extremely vivid story, carrying much new and hitherto unpublished material, of the Agrarian Movement and of the ups and downs and of the sordid tragedies of the Home Rule Movement between 1881 and the reunion of the Irish party, under the leadership of Mr. John Redmond, which was brought about in February, 1900.

Mr. Davitt has a high place in the esteem of thousands of people who have never indorsed his part of the Land League Movement or in the Plan of Campaign, and who would not under any conceivable circumstances support him as a candidate for Parliament. The good taste in which he narrates in these pages his own part in Irish politics will endear him more than ever to these people, who can admire him without sympathizing with him in much that he has done in his political career.

Kipling's Traffics and Discoveries

THIS volume * contains several South African War sketches, some amphibious tales, told partly on land, partly on sea, and the others are "queer" stories—the kind that Kipling alone knows how to write. Concerning "They" we have already had two editorials in THE INDEPENDENT, besides much discussion in other papers as to the author's meaning. But people who ask what Kipling means are like the woman he once wrote about who did not and "never could understand." They lack what his new wit, Pyecroft, would call the necessary "superstructure" to their minds. After he is dead they will be the ones to form "Kipling Clubs" to "study" him just as we now have "Browning Circles" composed of pedantic persons, who think by mere searching that they can find out the poet's meaning—and they will, when the earth no longer hangs between the east and west mystery of things.

The South African stories in this collection are likely to prove the most popular, since there is nothing esoteric in the conception; but they also have a double significance. They are really written to show the basis of the author's imperialism. Nobody knows how Kipling came by his genius; not in England, surely, where nothing new of this kind has been born since Shakespeare died. Probably he evolved it in India. The fever of the land kindled his imagination, and he saw men shipped from under the shelter of home traditions, suffer, live and die like inspired madmen for the imperial ideal. He was young then and in his enthusiasm to sum it all up in his "Soldiers Three" he used to spatter his white duck trousers with ink until he looked like a "dominecker" robin in a foreign land. But no matter where he got his gift, since the day he found himself he has spread the wings of all his glories above the British Empire, showing the talons and tail-feathers of his genius like a happy oracle in favor of every grace and strength which goes to the making of it. He is a patriot, not in the maudlin, popular definition of that term; but as Isaiah was a patriot in Judea—a prophet full of faith. He is the dramatist of national patience, ethics, honor and strength. Through the lips of the Yankee "Captive" he calls attention to the temperamental stolidity and mental simplicity of the British soldier, and then figuratively hugs himself with delight at this demonstration of their heaviness as a man

* TRAFFICS AND DISCOVERIES. *By Rudyard Kipling.* New York: Doubleday, Page & Co. $1.50.

would rejoice in the granite foundations of his house. Regiments brought to South Africa in 1900 are spoken of by the General to the Yankee "Captive" as being the "vintage" laid down for the new century. War with the Boers was a military exercise by which an army was toughened, and the "game" preserved.

"Sitting there and hearing him talk about the centuries, I tell you, sir, it scared me. It scared me cold! He admitted everything—he acknowledged the corn before you spoke—he was more pleased to hear that his men had been used to wipe the geldt with than I was when I knocked out Tom Reed's two bad horses—and he sat back and blew smoke through his nose and matured his men like cigars and—he talked of the everlasting centuries!"

The next generation will go to stories like this and "A Sahib's War" for an explanation of the facts which history will give about this South African situation. And they will get it.

But, however gifted our author may be, he is limited at last by what he knows. And it is what Kipling *knows* which affords him so many and varied fields for proving his artistic faculties. Thus the stories in this volume relating to naval life differ from other sea tales in that they are based upon an intimate, technical knowledge of the British marine service. The *dénouement* does not depend upon the wind, the waves and the author's imagination; but it comes to pass in the military order of things. He has the mind of an artisan as well as the fancy of an artist, so that he is able to make an automobile the vehicle for carrying into literature the most delicate and daring fancies. This is where the uninitiated stumble, by the way, in their effort to understand "They"—how he dared ride through a world of unrealities in an automobile. Their imagination is governed by the old formula of things. They do not know that to the poet all things tend toward the same fairy ending. But this peculiar quality of Kipling's genius is best illustrated by the story entitled "Wireless." After a brief, but clear, explanation of the wave theory upon which wireless telegraphy is based, he makes an occult, astral application of it so plausible and dramatic as to be almost convincing. A poor young drug clerk in the shop below where the experiments in wireless telegraphy are being made, is dreaming of his love while shivering and dying, as Keats did, of consumption. And he gets his "message" there in the cold night from the immortal poet of love. Altho he has never read Keats, he writes lines from "St. Agnes Eve" and the "Ode to a Nightingale," believing them to be his own, and marring, as if in the first transmission, with occasional clod words, then correcting until the verse lay perfected as Keats wrote it. And that is Kipling's way. He finishes facts with a miracle; he passes from the natural to the supernatural as easily as a lark's wings bear it into the sun risen heavens.

Early Western Travels, 1748-1846. Edited by Reuben Gold Thwaites. Vol. III. Cleveland: The Arthur H. Clark Co. $4.00.

The third volume of Mr. Thwaites's valuable series is no less interesting than the earlier issues. André Michaux's *Travels into Kentucky*, 1793-96, is the first of the three reprints in this volume. The author was a scientist of world renown, whose work as a botanist overshadowed the fame that he acquired in the field of politics. His scientific explorations in the Mississippi Valley, prior to 1794, had given him such a familiarity with the men and conditions in that region that Genet, the agent of the French revolutionary government, selected him to negotiate with the Western leaders, whose interests he sought to detach from the United States. Michaux's journal during this mission betrays more interest in a rare plant or a new tree than in an American leader or a political plot. The record is, however, of the impressions of a man of unusual intelligence, one who has learned to use his eyes to see everything about him. The lack of inns, the straying of horses, the poor fords and the frequent necessity for waiting until a sufficient body of travelers had collected to act as a guard through the uninhabited regions, give us a vivid impression of the country traversed by the Wilderness Road to Kentucky; the route from North Carolina to East Tennessee; the path to Louisville, and the Indian trails to Illinois. The journal of the son, François, through the same region (1801-3) shows how rapidly the West

had developed. François describes shipbuilding upon the waters along which his father passed seven years before in Indian canoes. The traveler notes the restlessness and the eagerness of the pioneers to push on, impatient of the trammels of civilization. The third journal, that of the clergyman, Thaddeus Mason Harris, who just missed being Washington's private secretary, is characterized by a delight in describing natural scenery, and a dry statement of the human facts that drew his attention. There is much accurate data about the size, prosperity and growth of towns, their business interests and stage of development. As a picture of Western life the value is small. Mr. Thwaites's editing is, as ever, the work of a master.

Man and Woman: A Study of Human Secondary Sexual Characters. By Havelock Ellis. [Contemporary Science Series.] Fourth edition, revised and enlarged. New York: Charles Scribner's Sons. $1.50.

This work originally appeared ten years ago, when exact data on the subjects of which it treats were far less accessible than at present. It has now been in large part rewritten in the light of more recent material. The main conclusions, however, are still maintained. Only in the chapters on the senses has the author found it necessary to record changes in his earlier views. A considerable part of the book is taken up with an answer to certain strictures on the author's position regarding the greater variability of men over women, made some time ago by Prof. Karl Pearson. The author holds fast to his original contentions, supporting his position with keen dialectic and a great wealth of testimony. There is probably more nonsense and rash generalizing on this subject than any other; therefore, such a book as this, which gives or refers to nearly all the information wherewith a sound opinion may be formed is valuable.

The President. By Alfred Henry Lewis. New York: A. S. Barnes & Co. $1.50.

This is a political novel of American life, brilliantly written, and abounding in dramatic situations. But it is an ignoble book for the same reason that a man is ignoble who exaggerates the worst he knows about everybody and everything. If we are to believe Mr. Lewis, every man connected with the Government at Washington is a scamp and a blackleg, from the President down. The picture is not only revolting and disgraceful, but it is malicious. While there may be rascals among Government officials, as there are in every other class of men, the average of honor and morality among them is doubtless as high as in any other. Certainly we never had a President who bore the slightest resemblance to the sharper here depicted. Their political views and political actions have never pleased all the parties in this country, but, considered as a whole, they are about the best men we have produced in America, according to our standards of courage, intelligence and morality. But the particular reason why the book is pernicious is because there is a stage of adolescence when young men imagine that wisdom consists in suspecting the worst everywhere. It is a grotesque, formative period which Lewis's book confirms and justifies, thus fixing an error in the minds of many that will astigmatize their vision of life forever.

The Singular Miss Smith. By Florence Morse Kingsley. New York: The Macmillan Co. $1.25.

Mrs. Kingsley's story reminds one somewhat of "Work," written by Louisa Alcott many years ago. The experience of a refined woman in other people's kitchens is apt to be piquant. That she should be a multi-millionairess in addition is only a detail. That she should meet a masquerading Professor of Sociology in a fifth-rate boarding house is a slight tax on our credulity. But it is a charming little tale, and *The Singular Miss Smith* is a singularly sweet heroine. Like so many sociological books, it states a problem which it does not solve, but the statement is clever. The caricature of the "Ontological Club" is overdrawn to a degree, and there is a touch of exaggeration in the outlines of the minor characters, but they are certainly amusing folk, and sometimes there is shrewd sense in their homely advice: "Think yer somebody—folks don't think no

more o' you than you think o' yourself. Git some sprawl first off." "The gents I've come acrost allers take the wimen folks at their own price-tickets!"

Literary Notes

....The Creevey Papers, of which we published a long review on page 560 of Volume LVI, is now published by E. P. Dutton & Co., New York, in a single volume at $4.00 net. In our advertisement of last week we erroneously quoted the price as $8.00.

....Fleming H. Revell Company brings out a unique volume, perhaps suggested by "Letters of a Self-Made Merchant to His Son," entitled "Letters of an Old Methodist to His Son in the Ministry." It is full of quaint philosophy and much sensible advice to the young minister of any denomination. It is written by Robert Allen and sold at $1.25.

....The Church of to-day has its peculiar problems in addition to the world-old ones it has inherited. One is the question of a helpful Prayer Meeting, another, in many communities, is the Sunday evening service. E. B. Treat & Co., New York, publish a volume on "The Sunday Evening Problem," by Dr. Hill, of Salem ($1.00), which may help some discouraged clergyman solve his special form of the problem.

....Some of the more striking passages in *From Talk to Text*, by Addison Ballard, published by Longmans, Green & Co. ($1.00), are in line with an article of Dr. Ballard's published in THE INDEPENDENT, under the title "Christianity, a Return to Judaism." The chapter in the present volume is published under the caption: "The One Religion." "The Parallax of Pain" and "The One Thou Shalt" are other interesting sections of the book.

....The International Studio, which has been steadily advancing in artistic and literary value during its existence in the United States, announces a change of price, to begin October 25th, from $3.50 to $4.00 a year and from 35 cents to 50 cents a copy. The magazine affords a complete survey of American art in particular and the world's art in general containing among its attractive features each month a number of color plates issued, besides numerous full page plates in mezzotint, photogravure, colotype, lithography, etc.; upward of 150 black and white illustrations and 130 pages of text. The publisher, John Lane, offers to receive new subscriptions and renewals of old subscriptions before October 25th at the old rate.

Pebbles

THE strike is over. Now note how the price of steak falls to meet the ruinously low price of beef cattle. Let us know when you note this.—*The Atlanta Constitution.*

...."Stand up straight, don't look at the boys, and keep your shoes tied," is the advice given by the dean of Bryn Mawr college for girl students. Nothing about Spiritual Ideals or Higher Life in it, and it sounds almost too sensible to be true.—*Atchison Globe.*

....SHE WAS EMBARRASSED.—*Bobby* (at the breakfast table): "Clara, did Mr. Spooner take any of the umbrellas or hats from the hall last night?" *Clara:* "Why, of course not, Bobby; why should he?" *Bobby:* "That's what I'd like to know. I thought he did, 'cause I heard him say when he was going out, 'I'm going to steal just one, and'—why, what's the matter, Clara?"—*Pick-Me-Up.*

....LIKE BEATING YALE.—Just suppose it. Imagine Mr. Roosevelt "licked!" Picture in your mind the awful thrills and shocks that would roll through the divinely ordained Republican party, culminating in an eruption of astonishment at the White House end of Pennsylvania Avenue, that, behind the scenes, would beggar description. One thing is certain, if Roosevelt should be beaten, the time would be worth living through. It would almost be like beating Yale.—*Springfield Republican.*

...."Wanted: Stories full of strength and action. No description or scenery need apply." She read it; it sounded alluring. Result:

SIMPLE, BUT TRUE.

The car was full—too full! Everyone was smashed flat. Suddenly the car stopped! Forty people were hurled on their faces. Then it started! Sixty people fell on their backs. Then it blew up! The motorman overhung the trolley wire and spoilt the connection. Then it burned up! Out of seven hundred and thirty people six hundred and ninety-two were late to dinner. The rest either ran or took cabs.—*The Critic.*

....*Wife:* "Tell me, honestly, John, if I should die, would you marry again?" *John* (desiring to please): "Marry again? Of course I wouldn't. Such an idea would never enter my mind." *Wife* (angrily): "Oh, you wouldn't? You don't find marriage pleasant, I suppose? No doubt you are sorry you married." *John* (still desiring to please): "You don't understand, my dear. I was joking, of course. I meant that I would marry again." *Wife* (more angrily): "You would—eh? You are in an awful big hurry to get married again. Perhaps you wish I was out of the way! I knew you would be glad if I died."—*Topeka Herald.*

Editorials

Mr. Cortelyou and the Campaign Fund

In these closing weeks of the national campaign an attack has been made by Democratic journals of conspicuous ability upon Mr. Cortelyou, chairman of the Republican National Committee, and indirectly upon the President himself, with reference to the collection or reception of contributions to the campaign fund from great corporations.

The substance of the charges is that applications from Mr. Cortelyou to the so-called Trust corporations and to some railway companies have a compelling force because he has knowledge of the secrets of their organization and business methods, acquired while he was at the head of the Department of Commerce and under the law enacted in February, 1903, which authorized the Department to obtain this knowledge by official investigation; also, that his applications to all the prominent railway companies have a highly persuasive quality because it has been semi-officially announced that he is to be placed at the head of the Post Office Department and will thus exercise supervision over railway mail contracts involving $40,000,000 a year.

It is asserted that because of his recent and his prospective relation to the execution of laws affecting these industrial and railway corporations great sums have been given to him for political uses, and even that Democrats have felt that it was expedient or necessary to contribute to the fund of the Republican party. Those who make the charges suggest, of course, the inference that corporations so contributing expect thereby to purchase immunity or favor. Where reference has been made to requests for contributions no names or details have been given.

Certain Republican journals have emphatically denied that any corporation has been approached with the aid of any influence which the Chairman's official knowledge of its affairs or his prospective restoration to the Cabinet could exert. Publicity has also been given to Mr. Cortelyou's remark that the President was to be elected without incurring any obligation whatever, through the agency of the National Committee, to any corporation, interest, or person.

The law defining the powers of the Commerce Department's Bureau of Corporations, or the part of it containing what were called the "publicity provisions" of the statute, was supported by the Senate as a kind of compromise. There was pending the drastic bill of the House, modeled upon Mr. Knox's suggestions and designed to provide for the prosecution and restraint of combinations of manufacturers. This the Senate would not consider. Mainly by the efforts of Mr. Hanna in the Conference Committee the "publicity provisions" were accepted and enacted. They were in accord with the President's policy.

The fruit of them thus far has been no publicity whatever. Investigations have been made by the Department. The results have not been published. It is not required by the law that they shall be. They were to be reported to the President to enable him "to make recommendations to Congress for legislation." Mr. Cortelyou is acquainted, we suppose, with the information obtained up to the time when he left the Department to become Chairman of the National Committee. Whether this information is of such a character that it could be used to the injury or disadvantage of the corporations affected we do not know. We assume, however, that if it had disclosed a violation of Federal laws it would have been transmitted to the Department of Justice.

The use of the word "publicity" to characterize the statute defining the powers of the Bureau of Corporations is unwarranted. So far as the public can ascertain it is a law for secrecy. It should be amended or repealed.

We believe that neither Mr. Cortelyou nor the President is capable of making an improper use of the power vested in the Department of Commerce. We are confident that any suggestion of the use of that power, or of the information procured by the Department, in soliciting campaign contributions from corporations, would be revolting to Mr. Roose-

velt. We have no reason to think it would seem less objectionable or less shameful to Mr. Cortelyou. We have understood, and we believe it to be true, that the President selected Mr. Cortelyou for Chairman because of the latter's integrity, because he was convinced that the Secretary was in the highest sense trustworthy, and because he was determined to avoid the embarrassment of such political obligations as were, in several instances, imposed upon Mr. McKinley by Chairman Hanna. In short, we think that Mr. Roosevelt's motives were excellent, and we have seen no proof that his confidence in Mr. Cortelyou was misplaced.

If the Chairman has used his knowledge of corporation secrets or his prospective power to extort money from corporations he has taken a fearful risk. Not all of those so despoiled could be expected to remain silent, and clear proof of only one instance, if given to the world, might in itself defeat the Republican party.

But, while such is our confidence in the President and the Chairman whom he selected, we cannot deny that the circumstances lend themselves to the theory so persistently laid before the public by the President's political foes. They certainly tend to support, in a mind moved by partisan enmity, the charges that are made. Here is a Department, one branch of which has been engaged for the better part of a year and a half in obtaining by official warrant information concerning corporate combinations, many of which are commonly believed to exist and to be doing business in violation of law. This information is withheld from the public. The Secretary, who, by virtue of his office, knows what it is, whether favorable or injurious, is made Chairman of the National Committee, and thus becomes an officer whose duty it is to receive, and even to solicit, contributions to the campaign fund. The bulk of this fund in the past has come from corporations or firms or persons interested in legislation.

At the same time it is made known that he is hereafter to exercise authority concerning the great mail contracts, as to which charges of favoritism and extravagance have from time to time been made. It also appears that the prosecution of corporate combinations commonly believed to be unlawful has been discontinued or suspended; that nearly all the special fund appropriated for the purpose remains unused; that great corporate interests which bitterly opposed the President a short time ago are now working for his election; that even the heads of the Beef Trust, against which prosecution is pending and concerning which Mr. Cortelyou's Department has made minute investigation, publicly proclaim their support of his candidacy. In the light of such circumstances the charges of the Opposition become quite plausible, to the ears of Democrats at least. This will be admitted, we think, by Mr. Cortelyou himself

It is unfortunate that the purely circumstantial evidence in support of these charges should seem conclusive to any one. It has no force with those who really know the President and the Chairman. The flat denials of Republican partisan journals have no weight beyond the rank and file of the party. Absolute proof to all that the charges are unwarranted can be given only by complete publicity with respect to all contributions. There ought to be such publicity. This may seem a counsel of perfection, but we hold to it. The need of this publicity grows from year to year as the money power grows, and with it the concentrated industrial and commercial interests that are affected by legislation and by the execution or suspension of the laws.

Professor Harnack's Significant Lecture

Prof. Adolf Harnack, of the University of Berlin, delivered last week in the Union Theological Seminary of New York City a remarkable address, which was especially noteworthy and significant because of the attitude of the lecturer toward the divinity of Christ. Harnack is probably the ablest and most distinguished theologian in the world. His work on the "History of Dogma" has revolutionized the teaching of Church history, and his lectures on the "Essence of Christianity," published in English under the title "What is Christianity," has had the widest circulation and the greatest influence of any religious book of recent years. He is unquestionably the

leader of liberal theological thought in Germany, and he is regarded by the conservatives as their arch-enemy. Yet in his address last week, delivered in German before a distinguished audience, which gave him breathless attention, Harnack made what appeared to a member of the staff of THE INDEPENDENT present to be a veritable confession of faith in Jesus Christ, the Son of Man and Son of God. To be sure, the words "divinity of Christ" were not spoken, nor was there any mention of divine and human natures. But the question whether Jesus had a special relation to God, a special position in history, and a special relation to us was answered with a clear and emphatic Yes. The lecture was the precise equivalent in the thought-forms of to-day of Bushnell's well-known chapter, "The Character of Jesus, Forbidding His Possible Classification with Men." It proclaimed what the ordinary man means by the divinity of Christ, that Jesus was not as other men, that in his character and person and in his fellowship with God he was unique and alone. Without use of the phrase, Harnack declared of Jesus what most men mean when they pronounce him the Son of God. He differed in terms and method of statement from the orthodox confessions; but there was no difference in religious attitude nor in the sense of the solitariness, the elevation and the worth of the Man of Nazareth.

The whole temper of the lecture was conservative. The positions attacked were those of scholars who had gone too far in denying the possibility of the construction of history on the basis of the New Testament. The effort was to show that, granting all the rights of criticism, an historical kernel remains, and that we have reliable and trustworthy records for determination of the thought and manner of manhood of Jesus. Indisputable facts to which sufficient stress had not been given were brought into clearness, and the impression was of one building up from material cast aside by careless builders a structure very much such as the common, good Christian man wants to see erected.

Yet the method advocated was that of the higher criticism. Harnack stated that he knew no other method which could give results in which a modern educated man could have any confidence. The criticism of the gospels which he employed was far more radical and thorough-going than anything with which popular religious literature in America has made us familiar. He said that not only the entire fourth gospel, but much of the other three gospels, are not biography, not memorabilia, but literature reflecting the influence of Jesus in the *form* of biography. He suggested that many of the miracle narratives were amplifications of historical kernels, and that some of the parables, as we have them, are not in the form in which Jesus taught them, and that we can secure his teaching only through criticism.

But it is certainly noteworthy that a scholar who appoints no limits to his criticism, who says freely that we cannot be sure that all the words imputed to Jesus were actually spoken by him, should fix so determinedly upon so many of the things which common men hold to in Jesus Christ, as certain results in historical science. Harnack declared in this lecture that in his opinion the healing activity of Jesus, his principal parables, many of his particular sayings, and his claim to be the Messiah, were historic facts. Among the sayings certainly authentic he included the sacred words in Matthew 11: 28-30:

> "No one knoweth the Son save the Father, neither doth any know the Father save the Son, and he to whomsoever the Son willeth to reveal him. Come unto me all ye that labor and are heavy laden, and I will give you rest."

Remembering how many have confessed suspicion as to these verses, as akin to the fourth gospel in late origin as well as in character, and remembering how recently Wellhausen's denial that Jesus ever claimed to be the Messiah seemed to be in the ascendant, the more conservative position of Harnack is noteworthy.

The closing sentence of this remarkable lecture was especially significant:

> "I may have said nothing new to you, but I have thought that it might interest you to know that what I have here said is taught to-day in theological class-rooms."

The speaker had in mind his fellow Germans, pastors in New York, of whom

a large number were present. The Jesus he proclaimed was not new to them, tho they were men of pronounced orthodoxy. He confessed his essential oneness in religious attitude with men who hold to the divinity of Christ.

The New Testament is to be subjected to severe criticism in the coming days, and especially the gospels. It would be idle to say that the Bible, or the life of Jesus, will be the same after the process as before. Radical changes in the interpretation of Jesus and of the books which preserve his spirit are to be expected. Yet here is the warm and earnestly religious confession of one who has traversed already much of the ground which the future criticism of the gospels will cover, that Jesus of Nazareth is and remains a unique manifestation in history, a personality of unique relation to God, and one to whom the soul of every man who really knows him must be related as to none other he can ever know. A few years ago Harnack checked the tendency to the late dating of New Testament books, and put some of them back even earlier than conservative scholars had supposed them. It would seem from this Union Seminary address that he may do the same thing in the doctrine concerning Christ, and in our interpretation of Jesus bring us nearer to the orthodoxy of our fathers than is the case with most liberal theological teachers to-day.

A Reply to a Challenge

Ex-Governor D. H. Chamberlain sends us his pamphlet entitled "Recent Phases of Our So-Called Negro Problem," mostly addressed to Prof. James Bryce, but embracing several late letters of his, chiefly in a Charleston, S. C., paper. On the first page he prints these lines, quoted from that journal:

"In publishing this document we commend it to all; but we take leave to commend it especially to some of our esteemed Northern contemporaries—namely, the New York Independent," etc.

We take this as a challenge. When we first read the letter in the columns of one of the most vigorous exponents of hostility to the negro race we did not feel it necessary to expose its weakness, but now that it is republished for wider circulation, and evidently just now with political intent, for the sake of its attack on President Roosevelt, we will give a few words to its main propositions.

Governor Chamberlain was a captain of colored troops in the Civil War, settled on a plantation in South Carolina, became Republican Governor of the State in Reconstruction times, was forcibly driven out of office as a Carpet-bagger, and has since taken a more hopeless view of the Southern negro than in his ardent youth, having, as he says, at 60 or 70 reversed the opinions he held at 30 or 40. Possibly in these years he has learned some things that are not true. Wordsworth forgot the chivalry of his youthful sonnets and became the "Lost Leader":

"Still bidding crouch while the rest bid aspire."

Governor Chamberlain's whole discussion is based on the assumption that there is a serious difference between the two races in "original capacity," so that "the negro is incapable of being raised by any education to an equality with the white man" in his hopeless, "ineradicable" "race inferiority." For this assumption there is no evidence whatever in ethnology or comparative psychology. It is simply asserted, against the evidence of equal physical size and strength, and against the evidence of numerous cases where, in these few years, education has been allowed to do its work.

Equally baseless is Governor Chamberlain's history. The negroes, he says, were "forcibly transplanted" to these shores. Not at all. They have grown up here, native born. It was their ancestors that were forcibly brought here, at the same time that multitudes of our white ancestors were forcibly transplanted here, white slaves sold to service in Virginia and Massachusetts. But he says again:

"My study does not disclose another instance anywhere of the emancipation from chattel slavery of a people or race without exertion on the part of the enslaved people or race. . . . Till the actual and complete triumph of the armies of the Union, the negro race of the United States, which was in slavery, lifted no single hand, struck no single blow, for its own freedom. The significance of this fact is tremendous as an indication of character and capacity."

Possibly this captain of negro troops

thought differently forty years ago. Then he might have excused unarmed negroes from not rising in insurrection. People in cruel subjection never rise when they can get no arms; they only run away. So Slatin Bey submitted to slavery under a negro master. But the fact is that the Governor's "study" needs to be enlarged. As a boy he probably read the story of a nation of slaves led out of Egypt, emancipated without striking a single blow for freedom, and in just the time now past since negro emancipation they were able to conquer Canaan. Then came another period when they were carried captive, made slaves, and were then returned by Persian deliverers without striking a blow, and a very decent people they made, our Master and his Twelve from the stock. Again they were terribly oppressed by every nation in Europe, and again were freed without a blow by the Rothschilds and Jacob Schiffs. Will Governor Chamberlain mention as many parallel cases where white "chattel slaves" have secured their freedom by fighting?

We will not stop to consider what Governor Chamberlain says of the impossibility of "blending the two races by intermarriage." Marriage is a matter with which we do not meddle—every man to his taste—but we do know that the "blending" is easy enough. A much more serious difference which we have with Governor Chamberlain concerns his statement that we must "undo, as far as possible, what we have heretofore done for the negro since his emancipation—namely, the inspiring in him the hope or dream of sharing with the white race a social or political equality."

"These things," he says, "are impossibilities within any measurable range of time, if ever."

With social equality we have no more to do than with marriage, as that goes by personal favor; but political equality is not impossible. One does not need to go to Cuba to see that it is possible, for it is a fact no further off than Philadelphia, with its seventy thousand negroes, or Maryland as well.

Governor Chamberlain declares—and no one should know better than he, for he was Governor of South Carolina at the time and did his best to stem the corruption—that the sudden gift of political equality to the negro "resulted directly in shocking and unbearable misgovernment wherever the negro race predominated"—that is, in South Carolina and Mississippi, and perhaps Louisana. True, and it was to be expected where th intelligent white people all sulked. Things were different in Georgia and North Carolina.

Governor Chamberlain proceeds to palliate, and seems to justify, lynching for assaults by negroes on white women. A reply to this it is not worth while to make, but it is worth while to say that the remedy he proposes—namely, a great moral crusade among the negroes against the particular crime of rape—would be more likely to suggest than to prevent the crime. It is not a specially negro crime. There are as many cases of this crime reported committed in New York State by white men as by negroes in all the South.

Having thus briefly expressed our difference with Governor Chamberlain as to his facts, we are compelled to agree with him that the proposal to protect negro political rights in the Southern States by Congressional legislation is quite futile. It will be impossible to enact a constitutional law that will really limit the representation of the States that have shut out the negro vote. It may be possible, however, to compel here and there a name to be put on the register, but this will accomplish little.

But this is about the limit of our acceptance of Governor Chamberlain's conclusions. He condemns President Roosevelt for asking Mr. Washington to stop to lunch, because of "the feeling universal, or nearly so, among the white people of the South." But what of that? President Roosevelt is no slave of the Southern "feeling." He can take his choice between Southern feeling and Northern feeling. Governor Chamberlain lives, summers, in West Brookfield, Mass., and very few respectable people in Massachusetts would object to sitting at table with Mr. Washington. Massachusetts "feeling" is as well worth following as that of South Carolina. Governor Chamberlain says that however the President may have thought it right to sit at table with Mr. Washington, "the principle

laid down by the Apostle Paul would have restrained him from this act." Indeed! Not at all. That principle is that of self-denial for the sake of not leading a weak brother into sin. But our Southern friends will not thank Governor Chamberlain for classing them with "weak brothers." We do not so regard them. Paul asserted another principle, that of liberty, in the case of the social and religious prejudice of the Jews against the Gentiles, "to whom we gave place in the way of subjection, no, not for an hour."

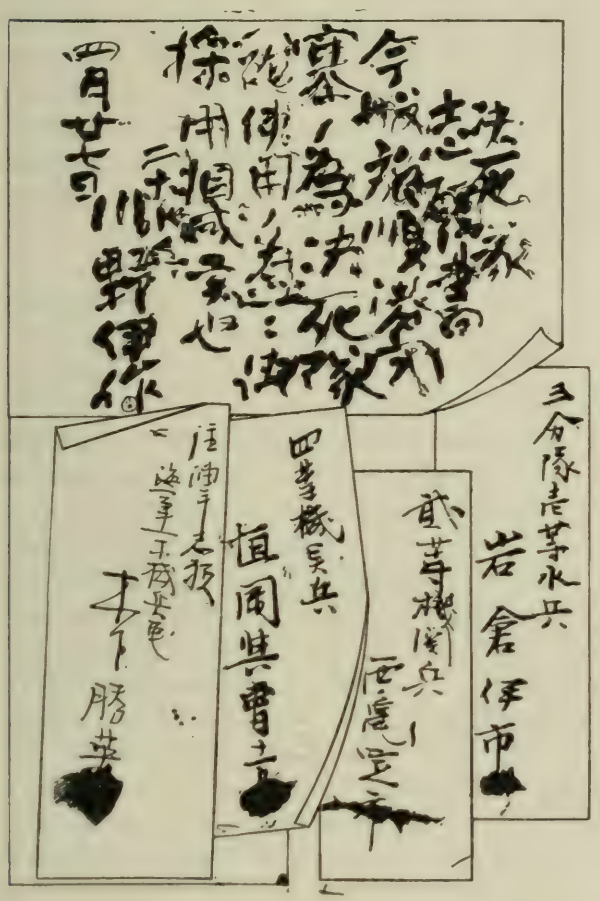
We are not acquainted with Dr. Crum and cannot thus deny what Governor Chamberlain says as to his competency to fill a $1,200 position as Collector of the port of Charleston. The presumption is that he is competent. But this we must speak of, Governor Chamberlain's assertion as to the President's motives:

> "They could have been no other than the hope and determination to gain for himself the support of the negro race in South Carolina, through their delegates in the next National Republican Convention, in his candidacy for nomination for our next President. His work has been effective in that end, but . . . it is ignoble in its motives."

Such a charge is unworthy of a gentleman of Governor Chamberlain's character. Sufficient other reason has been given and should have been believed rather than that such an "ignoble" motive should have been attributed to an honored and honest man.

We will not stop to discuss Governor Chamberlain's treatment of the Indianola case. Suffice it to say that the people of Indianola compelled the resignation of a competent postmistress solely because she was colored, and refused to receive her back. Nor is the suppression of the post office such a tyrannous or unparalleled act as is represented. Governor Chamberlain in one breath says that we cannot indict a whole community, and in the next asks why the Federal courts did not punish those who compelled her resignation.

Closing the post office was the only way with those who would not have a postmaster.



Governor Chamberlain's conclusion is that the old fashioned virtues of patience, kindness and fair dealing "exhibited toward the negro," with "the granting of the ordinary *civil* rights," "will do more, far more, than schools or colleges, than churches or missions, to roll back the tide of bitterness and violence." It sounds like saying: Treat the dependent race patiently and kindly, as you would your horse or your dog, and don't bother to help it rise too far, for "his lot is and will be to serve. . . . I expect no more." We would say to the negro race: Get your schools, colleges and churches; get your farms and your shops; acquire character and education and wealth; be patient, but especially patient in persistently, yet prudently, demanding and exercising your political and civil rights. Expect to be recognized as other citizens are recognized, but do not sulk when not recognized; accept office when it comes to you, but do not hanker after it or demand it; accept social favors, but do not ask them. And what we say unto you we say unto white men just the same.

Japanese Psychology

THIS is a new branch of mental science, not yet taught in any textbook or professed by any professors. But it is evidently a subject which will have to be seriously studied by all Americans who have anything to do in a business or diplomatic way with our neighbors on the other side of our back fence. The Japanese head is not a large one, but it has room in it for ideas which seem to us as far apart as the poles.

The present war has placed several problems in the new science on the blackboard for the world to solve. One is Admiral Togo's official report, in which he ascribes a naval victory, won by the most efficient use of complicated machinery, to the virtues and personal character of His August Majesty the Son of Heaven, Emperor of Japan. Another is the suicide of the officers and soldiers on the transport "Kinshu Maru" when that vessel, through no imaginable fault of theirs, was captured by the Russian fleet. Another is the refusal of any of the 2,000 reservists who were called to report at Tokyo for the Seventh Division to abide by the decision of the

physicians that they were physically incapable of military duty and their determination to die by their own hands rather than to return to the ignominy that awaited them at home. Then there are the wives and children who killed themselves that the head of the family might not be deprived of an opportunity of going to war because of his duty of providing for them. As Exhibit E we present the application of the Japanese marines for

assignment to death duty on the ships to be sunk in the mouth of Port Arthur, the petition written in blood and signed at the bottom by each man biting off the end of his finger and sealing it with the bleeding stump. There is the account of the wounded men who threw themselves into the trenches of Liao-Yang in order that their comrades might charge up the slope over their suffering frames. There is the story of the Japanese soldier weeping for his horse, as told by a field surgeon on another page of this issue of THE INDEPENDENT. Fanatics the world has always had, but not a nation of cool-headed fanatics like these.

With a patriotism which seems to us irrational they combine a rationality of method which astounds us They have no such mismanagement of men and munitions as was shown by English officers in the Boer War. They have no such pestilence camps as we had in the Spanish War at Santiago and Camp Alger. Dysentery, which has killed more soldiers than bullets, is treated by the Japanese surgeons as an infectious disease, and the cases are isolated in the field hospitals. The sanitary regulations of their camps are better than in many of our cities. Bacteriologists test the water and chemists the food before the soldiers are allowed to touch them. Of over a thousand wounded men received in the hospital at Tokyo prior to July 1st there was not a single death. The ideals of Shintoism allied with the methods of modern science and business organization are a combination of elements new to the world about which it is unsafe to prophesy. The Asiatic in breeches is a new man and nobody knows what he will do.

The Simple Life as Advertised

IF that modest Alsatian gentleman, the Rev. Charles Wagner, has a sense of humor he must be enjoying himself these days. Mr. Wagner once upon a time wrote a readable and commendable little book on "The Simple Life." Almost anybody can find suggestions in it that might be followed with benefit to himself and his neighbors. Nothing could be more alien to the spirit of a simple life, however, than our American habits of haste, waste, worry, self-advertising and trumpet-blowing on all occasions, and nothing could be more incongruous with Pastor Wagner's teaching than the methods by which his excellent book is being proclaimed to the populace. The spectacle of eminent divines tumbling over themselves to herald their estimate of "The Simple Life," not when a quiet reading of the book moved them to speed its message, but when a great newspaper, with the obvious motive of advertising its own enterprise, sud-

denly calls on them to dance to its fiddling, is one to make sane men sad indeed.

In the sense in which Pastor Wagner employs the words the "simple life" is a beautiful ideal, and we hope that the American people will some day make a sincere effort to realize it; but the first step in that direction must be one that they show no present disposition to take. As Pastor Wagner very clearly recognizes, modern life cannot be simple in the sense of being primitive. Modern life is frightfully complex and nerve destroying. It can be simplified only by dropping out of it the interests and activities that are no longer worth while. Of such dispensable elements the most worthless are those that make up our vast stock of humbug, claptrap, pretense and quackery, and the way to get rid of it is to be sincerely straightforward in all our thinking and dealing. American business methods are loaded down to the sinking point with preposterous practices, that self-styled practical men—who love to scoff at "closet philosophers"—are worshiping, like imbeciles, under the name of "hustle." When analyzed by the irreverent "hustling" is usually resolvable into two parts—namely, an absurd sort of bragging in advertising, which deceives nobody but simpletons, and a feverish looking out for the "main chance"—that is to say, seizing an alluring opportunity, without question of its social value, its enduring worth, or its moral conditions.

This spirit of American business permeates American social life, and even our educational system. Not habits of voluntary attention and solid acquisition are the objects striven for, but cleverness and showy information on a hundred miscellaneous subjects. Not quiet self-control and refined and gentle manners, but splurge, "appearances" and luxurious indulgence are the social desiderata.

The self-deception that the pursuit of such ends engenders fosters the growth of another habit also which is enormously burdening and wastefully complicating our existence. That is the habit of worshiping and trying to galvanize into a new life a vast number of dead ideas and customs that should long since have been decently buried and forgotten. The modern world has other conceptions of the universe than those that reigned in the minds of men in the dark ages. It has other views of social utility and of workable social relations than those that prevailed in the ages of despotism. It has other means of attaining the essential objects of life than those that were employed when forked sticks were drawn by serfs to stir up the earth. We shall not attain the simple life until we resolve to let go a thousand dead ideas and by-gone practices, and to adapt ourselves in an honest straightforward way by modern methods to a modern world.

Judge Parker's Speech

Concerning the policy supported by Judge Parker in his speech on Filipino independence we have recently expressed our opinion. The address was substantially an amplification of passages in his letter of acceptance, but was marked by more life and vigor, however, than have been shown in previous utterances from the same source. We regret that Judge Parker has relied upon "a student of conditions" in the islands (name not given) for a misleading and extremely pessimistic description, some parts of which may have been approximately true at the hight of the cholera epidemic, but are not at the present time. We regret also that he repeated the grossly incorrect assertion of his letter of acceptance that the cost of the islands to us has been $650,000,000. He even adds to it the "sacrifice of over 200,000 lives." Secretary Taft showed some days ago that the cost, up to May, 1902, had not exceeded $180,000,000, and that the annual cost of maintaining the troops there, in excess of the cost of supporting them at home, is not more than $5,000,000.

Accidents on Our Railways

Since the beginning of the year 232 passengers have been killed by 12 collisions or other accidents on our railways. Half as many more have

lost their lives by accidents which caused only one or two deaths. The entire number of persons, employees and others, killed on our railways in 1903 was 9,984. In comparison with the casualty records of European roads we make a poor and disgraceful showing. The recent frequency of such appalling disasters as those which took place near Pueblo, Col., near Newmarket, Tenn., and in Missouri on the 10th inst. has excited much protest and inquiry. Our accidents are due to a variety of causes, the most prolific of which are the negligence, disobedience and recklessness of employees, who as a rule are the first to suffer for their own shortcomings. In some instances they become exhausted and partly disabled by continuous work for many hours, but rarely, it seems, do they suffer in this way by compulsion. Commonly, it is a desire to gain additional pay that causes such exhaustion. No company should either require or permit an employee to work continuously beyond a reasonable limit. In most cases the punishment of a disobedient or negligent employee—if he survives—is uncertain or inadequate. Since the opening of the St. Louis Exposition, traffic on some lines has been dangerously congested, with shocking results, with which the public is familiar. There are roads on which the improvement and strengthening of what our English cousins call the permanent way have not kept pace with the growing weight of locomotives and cars. The discharge of many employees, due to the recent depression of business, has not promoted the safety of passengers. Some think they see an unfortunate influence due to consolidations which deaden the old *esprit du corps* of small roads and separate the men from their employers. Others suggest that labor unions have tended to remove special incentives to fidelity, but it should be said that unions have shortened hours and thus tended to prevent such accidents as are due to overwork. Railroad companies desire to avoid accidents, even if the combination of parallel lines in some places leaves them no longer exposed to loss of business as a penalty for bad management. Railroad Commissions could compel improvement, but they do not do their whole duty. The public could apply remedies for defective and careless service. But a great majority of our people are too busily engaged in their private affairs.

N-Rays

An almost unexampled case of international disagreement on a scientific question is that of the *n*-rays. French scientists have been publishing numerous researches for a year on a new form of radiation, the very existence of which is denied by English scientists. According to the French experiments these rays are given off by many incandescent sources, such as the Welsbach mantle and the Nernst electric light, and are distinguished from ordinary light rays by the fact that they pass through an aluminum screen and dry paper, altho they are stopped by sheet lead and wet paper. They are detected by their power of increasing the brightness of a faintly illuminated screen of some phosphorescent material, such as calcium sulphide. They can be focused by an aluminum lens and spread into a spectrum by an aluminum prism. Blondlot, their discoverer, professes to have determined their wave length and index of refraction. Yet many English scientists who have endeavored to repeat these experiments on the *n*-rays can get no evidence that there is such radiation and think the French savants are deceived on account of the difficulty of judging by the eye of faint differences in brightness. Even the photographic evidence is discredited. It may be that there is a great difference in the sensitiveness of the retina for these effects. The reports that *n*-rays are given off by a contracting muscle and a thinking brain have given rise to new theories of telepathy.

The Divorce Decision

One important decision has been made by the Episcopal Convention, important because a conflict of principles is involved. The convention has refused to change the canon so as to deny the innocent party the right to remarry in case of divorce for infidelity. The opposing principles are these: one, that of the right of an honest marriage to every person fit to marry, and the other is, the con-

tinued sanctity of broken wedlock. The advocates of the new rule, happily rejected, declare that marriage is so sacred that the scorning and rejecting and destroying of it by one party does not destroy it. Their position is utterly self-contradictory. One of these days they will go further and say that death does not destroy it, and we shall see more of this immoral forbidding to marry, which is a biblical sign of a corrupt age. When a person finds that his or her wedlock is irrevocably broken, he or she ought to be allowed and encouraged to remarry, because marriage is the most honorable, most moral and the safest condition for an adult human being. The time and labor spent in trying to prevent innocent people from living in an honorable estate, under pretense of honoring marriage, had better be spent in rebuking the actual social sins which break up homes. The men whose religion consists in making laws stricter than the laws of God or of nature are not only overdoing righteousness, but they make virtue odious.

Germany and The Hague

Over a year ago Mr. Carnegie gave $1,500,000 to The Netherlands for the erection of a Temple of Peace at The Hague. Yet up to the present time no steps have apparently been taken by the Dutch Government to put this money to its use, not even to select a building site for the Temple. An explanation, however, is being whispered about to the effect that some of the other Powers which are secretly hostile to the whole Hague movement are putting pressure on the Dutch Government. We do not know which these other "Powers" may be, but we do know that Germany alone of all the first-class nations was hostile to The Hague Court from the very beginning, and would doubtless never have joined in founding it if she had not believed the whole movement would be still born. In Germany the Emperor still rules by a sort of divine right, and considers himself and is considered responsible only to God. He does not, nor does the military aristocracy which supports him and governs the nation, relish any review of his actions by a human court made up of mere international lawyers. Is Germany working against the prestige of The Hague Court? We shall soon know when we see the *rôle* she plays in President Roosevelt's forthcoming Peace Congress.

Football Strategy

It is a little difficult for the ordinary reader to get a clear idea of the battle fought last week north of Liao-Yang, but to those who are familiar with football a few words will make the action clear. Kuropatkin, captain of the Russian team, gave the signal for a run around the left end, but Linevitch, the left halfback, had no more than started with the ball before Kuroki, who was playing right tackle on the Japanese side, broke through the line between the Russian tackle and guard, and in spite of the interference of Mistchenko threw Linevitch for a loss. The Russians still have the ball on their 40-yard line, with 30 miles to gain; but if they fail to make this distance in the next two downs it goes to the Japs. Nodzu, center rush, and Oku, left end, on the Japanese side, did splendid work, not only holding the line, but shoving back their men. More players were hurt than in any previous game of the season. If Russia fails to gain her distance on the next two downs and loses the ball, it is expected that Japan will attempt a drop kick to Mukden, the goal, and win the 1904 championship, for it is too late in the year for another match game.

"On the Princeton side of the field the scene was pitiful. Several of the players were heartbroken, while Foulke, the Tiger captain, cried and moaned like a person in agony."

This is taken from the New York *Sun's* report of the football game last Saturday in which Annapolis defeated Princeton, the 1903 football champions. Within the last half dozen years it has come to be the highest form of athletic etiquet for the captain of the defeated team to leave the field in tears, and accordingly Mr. Foulke is no more to be blamed than many of his predecessors for following the fashion. But we submit to any healthy non-collegian who has not been bred in the present over-emotional athletic era whether such doings are not babyish, silly and truly unsportsmanlike. The question also arises whether these lachrymose "heroes" would weep in such "agony" if they had no audience.

Insurance

Protection Against Fires

UNDER the above title Louis Windmüller contributes a valuable paper to the current *Forum*. He is convinced that most of the great fires could have been prevented under conditions that would not have been difficult to have created and to which he comprehensively refers. The chief factors in the prevention of fires, according to Mr. Windmüller, are a more liberal supply of water and a more efficient fire department. To these he would add a more substantial house construction in the place of the speculative buildings that are too often a scandal in our larger cities. A house with us that has been in existence for several generations is in the nature of a curiosity. The recent Baltimore fire taught some valuable lessons as to the ways and means of protection against fires. Had there been an adequate supply of water in Baltimore and if the fire had been given the prompt attention of a competent fire department the destruction of property by means of it could not possibly have approximated sixty millions of dollars. Another of the lessons to be learned of the Baltimore conflagration as to the steps that may easily be taken along the line of protection against fires is to be looked for in the building of the Continental Trust Company. Among the dismal ruins that were the result of a temperature reaching as high as three thousand degrees, and which stretched as far as the eye could see, the fire proof home of the Trust Company in question, constructed of concreted steel, loomed up in solitary splendor, to teach Baltimoreans something as to the building construction of the new "Monumental City." The great Chicago fire, the Boston fire, the Iroquois Theater fire, the fire that took place at the Charity Bazaar near the Champs Elysées, Paris, in 1897, and the fire that consumed the excursion steamer "General Slocum" each and all have a story to tell us as to what can and ought to be done toward a better protection against fires for the future. In conclusion Mr. Windmüller offers the suggestion that a society be formed to guard against the constantly recurring and ever present danger of being roasted alive. In this way he thinks that the loss of life and property for which this country has become notorious could be materially reduced.

Automobile Diseases

CERTAIN German and French medical journals have lately given much space to the consideration of what have been termed automobile diseases. The symptoms are all of a nervous character and the automobile maladies are thought to be caused by the excitement and extreme nervous tension arising from the high rate of speed frequently attained by the powerful motor cars of to-day. This is frequently aggravated by the necessity for emotional repression if one is to obtain enjoyment while speeding in the midst of ever present risks and dangers. This ailment has been called "neurosis of anxiety" by a German writer. Protracted journeys under the conditions noted are apt to be followed by palpitation of the patient's heart, pain in the stomach, general nervousness preceding a chill, with tremors and a chattering of the teeth. No evidence thus far presented indicates any disease except brain disturbance. Health and accident insurance companies will find new problems for solution in these automobile diseases.

BRITISH dispatches state that the English Parliament will presently be asked to enact a law prohibiting the insurance of children under the age of five years. The matter has reached the stage of agitation as a result of a conference of medical officers of a number of cities throughout Great Britain, who unite in considering that infant insurance is responsible to a very considerable extent for the alarming infant mortality existing in England.

....A story told at the Insurance Club is that a tourist lately returned from a trip to the Mediterranean has brought suit against the Prudential Insurance Company on the ground of misrepresentation because he says he looked the rock of Gibraltar all ove. and could not find the advertisement of that company, which he had been led to believe was painted on it.

Financial

Community of Interest

RECENT changes in railroad directorates point to a growing community of interest in which the ascendancy of the Standard Oil group is clearly to be perceived. The election of Mr. William G. Rockefeller and Mr. Frick (who is associated with the Rockefeller interests in the Steel Corporation) as directors of the Union Pacific appears to give the group control of the board. Mr. Frick also becomes a director of Reading. The group's holdings and power in New York Central, Pennsylvania, Northwestern, Atchison and other companies have recently been increased. Its relations to the Gould and St. Paul systems are well known. A large part of its great dividends from the Standard Oil Company and many other corporations is invested from time to time in railway securities.

Harvest Figures

THE gloomy estimates of Mr. J. J. Hill and some others are not confirmed by the Government's report on the corn crop, which points to a yield of 2,463,724,000 bushels. This quantity has been exceeded only twice, in 1899 and 1902. On October 1st (the report was published on the 10th) the condition of corn was 83.9, against a ten years' average of only 78.3. As interpreted by the Statistician of the New York Produce Exchange, the Government's figures indicate harvests of corn and other crops measured as follows, and we compare them with the harvests of last year:

	October, 1904	Harvest of 1903
Corn	2,463,724,000	2,244,176,625
Wheat	551,088,000	637,821,835
Oats	887,437,000	784,094,199
Barley	139,971,000	131,861,391
Rye	27,238,000	29,363,316
Buckwheat	15,245,000	14,243,641
Potatoes	396,419,000	247,127,850

The total for the six cereals is 4,084,000,000. For the five years preceding the present season, the annual average was about 3,725,000,000, altho in 1902 the total was 4,364,000,000.

The satisfactory size of the crops (wheat excepted) has been one cause of the marked advance in the market for securities, serving to promote the success of manipulation as well as to suggest purchases for investment. Among other causes have been some improvement in business, a growing demand for iron and steel products, and a general conviction in financial circles that the present Government at Washington will not be disturbed by the coming election. The Stock Exchange market has so broadened that a total of 1,510,000 shares was reached last Friday, followed by nearly 900,000 shares in the three hours of Saturday's trading.

IN the year ending on July 31st the Pullman Car Company increased its surplus by $3,741,625.

....It is reported that there is to be a combination of the German, British, French and Belgian manufacturers of steel rails.

....In the Connecticut Valley apples are so plentiful and the prices are so low that there is little or no profit in harvesting the crop.

....Several electric freight lines, from 15 to 100 miles in length, will soon be constructed in Washington and Idaho, to serve as feeders for the transcontinental roads.

....It was admitted last week by officers directly interested that the Hocking Valley road is now controlled by the Pennsylvania Railway Company.

....According to the Bureau of Statistics, the value of the annual exports of all nations is $10,515,000,000, and their imports amount to $11,800,000,000. That is to say, the value of the articles entering into international commerce is about $11,000,000,000. The value of articles entering into the internal commerce of the United States is about $22,000,000,000.

....Dividends announced:

Atch., Top. & S. F. R'way Co., Common, No. 5, $1.00 per share, payable December 1st.

Rock Island Co., Preferred, $1.00 per share, payable November 1st.

The Independent

Vol. LVII NEW YORK, THURSDAY, OCTOBER 27, 1904 No. 2917

Survey of the World

Secretary Taft's Mission to Panama

Owing to the complaints of the Panama Government as to the action of the Isthmian Canal Commission and Governor Davis under the provisions of the canal treaty, Mr. Roosevelt has asked Secretary Taft to visit the Isthmus, in order that by conference with President Amador and others an amicable adjustment of all differences may be made. In a letter to the Secretary, on the 18th inst., his instructions were accompanied by a statement as to our Government's attitude and purposes. Having referred to the order of May 9th, by which the work of the Commission and the government of the zone were placed under the Secretary's supervision, Mr. Roosevelt said:

"There is ground for believing that in the execution of the rights conferred by the treaty the people of Panama have been unduly alarmed at the effect of the establishment of a Government in the canal strip by the Commission. Apparently, they fear lest the effect be to create out of part of their territory a competing and independent community which shall injuriously affect their business, reduce their revenues and diminish their prestige as a nation.

"The United States is about to confer on the people of the State of Panama a very great benefit by the expenditure of millions of dollars in the construction of the canal. But this fact must not blind us to the importance of so exercising the authority given us under the treaty with Panama as to avoid creating any suspicion, however unfounded, of our intentions as to the future.

"We have not the slightest intention of establishing an independent colony in the middle of the State of Panama, or of exercising any greater governmental functions than are necessary to enable us conveniently and safely to construct, maintain and operate the canal, under the rights given us by the treaty. Least of all we desire to interfere with the business and prosperity of the people of Panama. However far a just construction of the treaty might enable us to go, did the exigencies of the case require it, in asserting the equivalent of sovereignty over the canal strip, it is our full intention that the rights which we exercise shall be exercised with all proper care for the honor and interests of the people of Panama.

"The exercise of such powers as are given us by the treaty within the geographical boundaries of the Republic of Panama may easily, if a real sympathy for both the present and future welfare of the people of Panama is not shown, create distrust of the American Government. This would seriously interfere with the success of our great project in that country. It is of the utmost importance that those who are ultimately responsible for the policy pursued should have at first hand as trustworthy information as can be obtained in respect to the conditions existing in Panama, and the attitude and real interest of the people of that State."

Therefore he had concluded that it would be of great advantage if the Secretary could go to the Isthmus and confer with the Panaman authorities. He authorized the Secretary to take with him such persons as he might desire. "You will advise the President of the Republic," he added, "what the policy of this Government is to be, and assure him that it is not the purpose of the United States to take advantage of the rights conferred upon it by the treaty to interfere with the welfare and prosperity of the State of Panama, or of the cities of Colon and Panama." Secretary Taft has invited Señor Obaldia, the Panaman Minister, to accompany him. It is expected that he will sail on the "Dolphin" about three weeks hence, with Admiral Walker,

William Nelson Cromwell (counsel of the Panama Canal Company) and Judge Magoon, law officer of the Commission. Minister Barrett will precede him. In Panama the news has given much satisfaction. As we have shown heretofore, Panama complains that the sovereignty exercised in the zone is unexpectedly absolute; that by the establishment of zone ports, custom houses and post offices, and by the operation of the Dingley tariff, she is in danger of losing two-thirds of her revenues and trade and that taxation and restrictions are imposed upon the suburban estates of her prominent citizens. It is reported that the rule of Governor Davis has not been marked by sufficient diplomacy and tact.

Judge Parker's Addresses

As election day draws near a decided increase of political activity is seen. While reports from the West speak of unexpected apathy in some States, a large registration in New York points to a heavy vote there. On the 21st, at Esopus, Judge Parker spoke at length concerning the expenditures of the Government. Answering the inquiry of Republican speakers whether a Democratic Administration would dare to reduce the cost of the army, he said that assuredly it would. The recent increase was unnecessary, he asserted, "unless militarism is to become a part of our policy"; it would not be sufficient, however, if we were to play the *rôle* of "the big policeman" in the South American States. But the people had "not yet approved the Administration's policy in dealing with those States"; the Monroe Doctrine was not concerned with their internal affairs. He insisted upon his estimate ($650,000,000) of the cost of the Philippines to date, saying that speeches of the late Senator Hoar showed that it was not large enough, and commending Edward Atkinson's estimate of $1,200,000,000. On the following day he read, at the same place, an address of 4,000 words on the tariff. This was largely historical. Tracing the course and character of tariff legislation from 1789 to the present time, he remarked that protection for infant industries had increased from 8½ to more than 50 per cent., while "the industries themselves had become colossal." He suggested that the submission of the railway companies to the exactions of the combined manufacturers of rails might be due to the influence of capitalists controlling both. The pauper labor argument, the infant industry argument and others used in the past had been displaced by the home market argument, which was "a bogy to frighten children." The action of the borax monopolists was cited as showing how tariff duties were abused. The owners of the borax deposits had advertised their ability to undersell the world, "and expressly on the ground of their ability to undersell foreigners they got a duty of 5 cents a pound. They then began to sell borax in England at rates far below what they charged to American purchasers, and are doing so now." The tariff bounties paid by the people were piling up mountains high:

> "The beneficiaries, having induced the Government to shut out foreign competition, form Trusts and combinations to stifle domestic competition. Not all the Trusts and combines are founded on the tariff, but most of them are. Their continued existence and their mode of self-perpetuation lead to the belief that the country is no longer governed by principles, but by interests. The most effective remedy that can be applied to the combinations or Trusts which owe their existence to excessive tariff duties is to reduce the tariff rates; while the remedy which can be effectively applied as against the other combinations is to enforce the law."

But the reduction of tariff rates should be gradual, "so as to prevent an immediate revolution in existing conditions." The work should be undertaken at once, and could be undertaken only by the Democratic party. Two days before this address Mr. Hearst's papers had urged Judge Parker to "break silence" on the Trusts, asserting that the Democrats had "dodged and wholly neglected the main issue, apparently for fear of interrupting campaign contributions." — Secretary Taft sent to Gov. Luke E. Wright at Manila the parts of Judge Parker's address (of the 15th inst.) on the Philippines, in which the latter quoted with approval the assertions of an anonymous "student of conditions there" that many of the office-holders were inefficient or dishonest and corrupt, being "the very dregs of our people"; also that agricul-

turally the country was ruined, that it was overburdened with taxation, that there was no freedom of the press, that men in private life were subjected to espionage by detectives in the guise of servants, etc. He asked for the Governor's comment. In his reply Governor Wright says that the assertions in question do grave injustice to a body of hard-working, self-respecting Americans, whose character and service will compare favorably with those of employees of the Federal or State Governments. Since the beginning of civil government (more than three years) the defaults have been $78,559, and nearly all the defaulters were appointed prior to the adoption of the civil service law, which is rigidly enforced. Complaints of oppressive action are exceptional, and have been followed by prompt investigation and correction. There is "nothing to warrant the statement that towns are in ruins, farms are going out of cultivation, people ill fed, and the country ruined agriculturally." Governor Wright speaks of the ravages of rinderpest in 1901 and 1902, which for a time caused distress. Crops this year are good and there is no suffering for lack of food. Both the tariff and the local taxes are lower than they were under Spanish rule. There are no bands of ladrones in Luzon or the Visayan Islands. Peace and order prevail in the islands inhabited by civilized Filipinos, except in parts of Samar, where fanatics and savages from the mountains have raided the natives in small towns on the coast. No newspaper has been subsidized or browbeaten, nor has any one been ostracized for criticising the Government. Political questions, immediate independence included, are discussed freely. Theatrical plays are not censored. Men in private life are not subjected to espionage. "All these statements," says Governor Wright, "are the veriest nonsense, without a scintilla of fact to support them." And he adds that "Judge Parker has evidently been grossly deceived."

Mr. Roosevelt's Panama Letter

It had been reported that something new and sensational in the way of documentary evidence concerning the Panama revolution was to be made public at a Democratic meeting in New York on the 20th. At that meeting Senator Culberson read a letter addressed, on October 10th, 1903, by Mr. Roosevelt to Dr. Albert Shaw. Having referred to an inclosed report from our Minister at Bogota, to show that "there was absolutely not the slightest chance of securing by treaty any more than we endeavored to secure," the President continued:

> "The alternatives were to go to Nicaragua, against the advice of the great majority of competent engineers—some of the most competent saying that we had better have no canal at this time than go there—or else to take the territory by force without any attempt at getting a treaty. I cast aside the proposition made at this time to foment the secession of Panama. Whatever other Governments can do, the United States cannot go into the securing, by such underhand means, of the cession. Privately, I freely say to you that I should be delighted if Panama were an independent State, or if it made itself so at this moment; but for me to say so publicly would amount to an instigation of a revolt, and therefore I cannot say it."

This letter (except the closing lines, beginning with the word "privately") was given to the public nearly a year ago with the President's consent. The essential parts of it were published in THE INDEPENDENT of November 19th, 1903. Senator Lodge now says that during the debate in the Senate preceding the ratification of the treaty he heard that his Democratic associates were looking for it; that he procured at the White House a complete copy of it and gave the same to Senator Gorman; that afterward, at the latter's request, he consented that it should be given to Senator Culberson, and that the treaty went to a vote while it was in the possession of the Democratic minority. It had been published a few days after the revolution.

Lynchings in the South

In accordance with the verdict of a court-martial, approved by Governor Terrell, Capt. Robert M. Hitch, who was in command of the militia at Statesboro, Ga., when the negroes Reed and Cato were burned at the stake, has been dismissed from the service for gross neglect of duty. Lieutenant Mell, who was in command at the camp while Captain

Hitch was at the court house, is sentenced to be suspended for one year and to be publicly reprimanded. A reprimand is also ordered for Second Lieutenant Griner.—As the result of four months' work by detectives employed by Governor Heyward, five of the white men accused of lynching Kitt Bookard, a negro, at Eutawville, S. C., have been arrested and will be tried. Bookard had threatened to strike an offensive and drunken white. For this he was arrested and placed in jail, from which he was taken in the night and murdered. The lynchers mutilated his body and threw it into the river.—In his charge to a Federal grand jury at Huntsville, Ala., a few days ago, District Judge Thomas G. Jones laid down a new theory of Federal jurisdiction with respect to the lynching of negroes, having in mind the recent lynching of Maples at that place. Maples, he said, was entitled under the Thirteenth Amendment, as a citizen of the United States, to be protected against the lawless violence of a mob of white men, if such violence, designed to deprive him of the right to be tried, was directed against him because he was a negro.—Private John J. Smith, of Nebraska, a white man of good character, a member of the Hospital Corps in the regular army at Fort Mott, N. J., and a veteran of the Spanish War, recently married a negro woman, who, as a member of the Volunteer Red Cross Society, had cared for him during an attack of yellow fever. The Post Surgeon at Fort Mott recommended that he be discharged "for the good of the service." This recommendation has been approved by General Grant and the Surgeon-General of the Army.

Conviction of Weinseimer

The trial of Philip Weinseimer, formerly president of an association including those labor unions in the building industry that went on strike in New York some months ago and were locked out, ended in his conviction. He had been indicted for extorting $2,700 from one Essig, a contracting plumber who had taken a contract in a large new building where Weinseimer threatened to order a strike unless this sum was paid to him. The defendant's assertion that he had received nothing from Essig had no weight with the jury in the face of convincing evidence to the contrary. It was asserted by the prosecuting attorney that in the last three years Weinseimer had deposited in four savings banks $85,277, altho his salary as president of the association, with his pay as a walking delegate, amounted to only $1,300 a year. The prosecutor evidently had consulted the books of the four banks and obtained a statement of Weinseimer's accounts. He said that all the money had been drawn out immediately after the defendant's arrest. Weinseimer was not required by the court to answer questions about these deposits. He will be sentenced on the 28th, the extreme penalty provided by law being five years.

The Philippine Islands

At the Lake Mohonk Indian Conference last week an address concerning the islands and their inhabitants was made by Dr. F. W. Atkinson, formerly the insular Superintendent of Instruction and now President of the Brooklyn Polytechnic Institute. He said:

"The Filipinos are incapable of self government; in their affairs they are managed by a few leaders. They have not yet cultivated a sense of fair play and tolerance for those who differ in opinion. They are childlike and do not know what is best for them. Independence is their cherished ideal, and that they may ultimately realize that ideal is, I believe, the unexpressed purpose of those who have undertaken the tutelage of these peoples. How far removed is this realization is beyond our power to predict; the proximity or distance of it must remain a matter of opinion. For some time to come their political dependence upon the United States must be very real. What is best for the Filipinos is the foremost consideration in the administration of their affairs, and the desire to put their interests first rather than to foster American exploitation has animated the United States Philippine Commission in all its acts. The commissioners have erred, if in any direction, in giving too great a degree of self government in both provincial and municipal affairs."

Another speaker was W. Leon Pepperman, of the Bureau of Insular Affairs, who pointed out that while there are "about 1,500 Americans in the civil service of the general Government, and about 2,500 Filipinos in the general Government service, there are only 100 Ameri-

cans, with more than 15,000 Filipinos, in the provincial and municipal governments." Of the teachers, 1,000 are Americans, and upward of 3,500 are Filipinos. He urged the necessity of giving the islands a market by reducing our tariff on their products to 25 per cent. of the Dingley rates.—In a military camp near Manila, on the 17th, Second Lieut. William D. Pritchard (a son of ex-Senator and Judge Jeter C. Pritchard, of North Carolina), while insane, killed Second Lieut. Frederick L. Deen, of Texas (West Point, '01), and then committed suicide. Both were officers of the Thirteenth Cavalry.—At one of Mr. Bryan's political meetings in Indiana last week there appeared with him on the platform two Filipino youths, who spoke briefly, expressing a desire for Philippine independence and asserting that the islanders are fit to govern themselves. These young men, who are studying at a Normal School near the place where the meeting was held, were sent to this country at the expense of the insular Government to be fitted for the civil service in the islands.

The Cuban Congress

Congress adjourned on the 20th, after a fruitless session of seven months. There was a continuous controversy in the House over contested seats. The Moderates succeeded in seating nearly all of their candidates, but they were rarely able to muster all their members, and the Nationalists frequently broke a quorum by withdrawing, or prevented action by obstructive tactics. On the 17th the House was in great disorder. President Palma sent in a message asking that $1,500,000 be appropriated for public works, nearly two-thirds of this sum to be expended in Santiago province. Several members declared that his purpose was to gain political support by the expenditure of public money. Spectators took part in the dispute, and it became necessary to clear the galleries. The appropriation, together with important bills concerning immigration and the municipalities, goes over to the next session. It is a question whether any of the session's legislation is legal, and a decision will soon be reached in a test case now before the Supreme Court. It appears that the Moderate majority disregarded the Constitutional requirement that two-thirds should constitute a quorum.

The Property of the Scottish Church

The Free Church of Scotland, into whose hands the House of Lords by its decision of August 1st has placed all the property of the Presbyterian Church, has refused to compromise or to make any concessions to the United Free Church, and petitioned the Court of Session at Edinburg to give them immediate possession. The United Free Churches in their counter petition pleaded for postponement until Parliament could take action in the matter, but this was refused by the court, which ordered that the judgment of the House of Lords be applied immediately. The Free Church of Scotland consists of 24 Gaelic ministers in the Highlands, who refused to unite with the other branches of the Presbyterian Church, and, because of their uncompromising attitude and adherence to the ancient standards of the Church are held by the recent decision to constitute the original Church and as such to be entitled to all the property of the United Free Church, which amounts to some $50,000,000 in buildings and $5,000,000 in cash. These 24 ministers will assume control of 1,100 churches, altho, of course, they will not be able to fill their pulpits. There are also three theological seminaries in Scotland and missionary schools and colleges in India to be supplied with teachers. On June 30th the 1,100 Ministers of the United Free Church of Scotland will be dispossessed of their manses and put out of their pulpits. The Archbishop of Canterbury just before he left this country for England was asked to act as a mediator.

Church and State in France

The Combes Ministry starts in with a larger majority than before the recent elections, and after a sharp debate of two days the Chamber of Deputies approved by a vote of 325

to 237 of the course of the Government in breaking off diplomatic relations with the Vatican. Premier Combes replied to his critics by giving a history of the events leading up to this action which, in his opinion, showed that it was impossible to maintain the present Concordat. The Bishop of Laval was called before a foreign ecclesiastical tribunal to answer to charges of gross immorality, such as frequenting a Carmelite convent and writing love letters to the nuns. This, in the opinion of the Premier, was merely a subterfuge as the real reason for the persecution of the bishop by the Pope was his loyalty to the French Government. He continued:

"In the light of such incidents, the separation of Church and State has become inevitable. Those who advise a revision of the Concordat are dupes who would condemn the Government to final humiliation. I am in favor of a free Church, but with the same freedom as our other institutions have. In reality it is the Pope who wants separation. He wants to enslave the State as he enslaves the Church. Let those who will perform penance before Popes; I have neither the age nor the taste for such practices."

A hot debate ensued between M. Ribot, leader of the opposition, and the Prime Minister, who interrupted him. M. Ribot insisted on the right to speak freely. "Freely, but not insolently," retorted the Premier. At this M. Ribot left the tribune and refused to return until M. Combes withdrew his remark. The majority given to the Government shows that it will be supported in its anticlerical measures, but it is somewhat questionable whether the very heterogeneous elements, Socialist, Radical and Democratic, which compose the governmental majority, will hold together on the three other items of the program, which precede action on the separation of Church and State—namely, the reduction of the period of compulsory military service to two years, the adoption of an income tax and the institution of a system of old age pensions for workingmen.—It is reported from Rome that the Pope is preparing a circular letter to be addressed to the French clergy. It will not deal with political questions at all, but will encourage the religious and social activities of the clergy.

Armenian Massacres The British Government has issued a Blue Book on the Armenian disturbances, which contains evidence to show that there has been gross exaggeration as to the extent of the alleged massacres, altho it is proved that many Armenians were killed in Sasun, Mush and other districts. Sir Nicholas O'Conor states that the Armenian Patriarch confessed his inability to give data in regard to the reported atrocities and did not claim to have trustworthy information in regard to them. The stories of the brutality of the Turkish troops and irregulars are confirmed. Diplomatic protests have effected no reform in Turkish administration in Armenia. A picture, which appeared in an Armenian paper and was republished in the French journal *Pro Armenia*, purports to be the reproduction of a photograph of a hillock covered with naked and mutilated bodies of Armenian insurgents, surrounded by a group of Cossacks under the Russian Commandant Bikoff. The photograph has many indications of being a "fake" and is denounced as such by the Russian journal *Novoe Vremya*. Commandant Bikoff has since been killed.

Formosa Under Japanese Management Whether Japan which is entering upon a career of expansion possesses the ability to control and develop colonial possessions is an important question just now, consequently especial attention is being given to the island of Formosa, where she has been making her first essays in the act of colonization. Formosa, which Japan obtained from China in 1895 as part of the spoils of war, had been successively in the hands of the English, French, Spanish, Dutch and Chinese, but the savage inhabitants of its fastnesses had never been brought under control until 1901 when the Japanese army succeeded in effecting a complete conquest. Since then the progress in civilization has been astonishing. The administrators sent out from Japan have been able and efficient, and enormous sums of money have been expended on the island. More than a thousand miles of road have been built, besides 95 miles of railroad. Altogether, it is planned to

spend $15,000,000 on the railroad system. There are now over 2,600 miles of telegraph and 1,390 miles of telephone lines in operation. The production of rice has increased 10 per cent. and of tea fivefold since 1896. The output of camphor has more than doubled, and millions of young camphor trees are being cultivated. Gold, silver and coal mining is being carried extensively. The population has increased from 2,455,357 in 1897 to 3,082,404 in 1903. The opium traffic was made a Government monopoly, not for the purpose of deriving a revenue, but to discourage the use of the drug, which was sold only to confirmed and licensed opium smokers. So successful has this policy been that the number of opium users is continually decreasing and the amount of opium imported has fallen a value of 3,392,602 yen in 1900 to 1,121,455 in 1903. Owing to the building of water works, sewers and canals there has been a great improvement in public health. The deaths from the plague have declined to one-third their former number. Schools have been established, and the Japanese language taught among the natives. The postal savings banks were used in 1902 by 41,145 depositors, and the amount deposited was 763,575 yen.

Russians Attack British Fishing Fleet

The Russian Baltic squadron in passing through the North Sea on its way to the Far East encountered a fishing fleet from Hull, England, and fired upon the boats, sinking some and killing at least two men. The Russian squadron continued on its course at high speed and passed through the Strait of Dover without making any inquiry into the damage done or attempting to rescue the men from the boats. The Russian ships, about 40 in all, were steaming in line through the fleet, and the first vessels had passed after examining the fishing craft with their searchlights, when, without any warning, one of the war ships fired six or more shells in rapid succession at the trawlers, and the other ships joined in the bombardment, which continued for half an hour. The steam trawler "Crane" was first sunk. The skipper and a deckhand were decapitated by the shots and other members of the crew were wounded. The "Gull" went to the assistance of the "Crane" and carried off her men without being hit by the shots which were falling all around her. The only explanation offered for the attack is that the Russian Admiral was on the lookout for Japanese torpedo boats or submarines, and may have mistaken the rockets sent up by the leader of the fishing fleet to give the sailing directions for the signals of the enemy's fleet. The night was wet and drizzly, and it was impossible to see at a great distance, but the Russian ships passed so close to the trawlers that the men could be seen cleaning the fish on the decks, and some of the fishermen held out fish in both hands to the war ships as they went by. The trawlers burned the international signal lights for fishing vessels, a white center with red and green sides. There is great excitement in England over the outrage, and it will be regarded as an act of war unless a satisfactory explanation is made immediately. The British Government has sent urgent notes of protest to St. Petersburg against the unwarranted action of the Baltic fleet, and the Russian Chargé d'Affaires in London has expressed the intense regret and grief with which the reports have been received, and the desire of Russia to voluntarily make full reparation in the event of the Russian squadron being responsible for the unfortunate occurrence.

On the Shakhe River

The Russian and the Japanese armies are now intrenched on opposite sides of the Shakhe River, between Liao-Yang and Mukden, and altho there has been some hard fighting during the past week, neither side has made any important advance. Different parts of the village of Shakhe were held by Russian and Japanese troops at the same time until the night of October 20th, when the Japanese evacuated their section and retired to a high hill a little distance south, which is strongly fortified. The village of Lin-Shin-Pu, just west of Shakhe and the railroad, is still divided between the forces, the Russians holding the north wall and the Japanese the fortified temple there.

Russian authorities deny that their losses in the ten days' battle of the Shakhe reached 60,000, but admit 40,000, and state that there are 24,000 wounded men at Harbin. The Japanese have not reported their loss; the Russians say it must have been at least 30,000. More ammunition was expended than in any battle of the world's history. The Russians have fired more shots in the battles of Liao-Yang than during the entire Russo-Turkish war. Both sides report the capture of many guns and prisoners. The Russians take great credit for the capture of Lone Tree Hill (Poutiloff), on the Shakhe River, east of Shakhe village and commanding the road from Mukden to Bentsiapntza. This was strongly fortified by the Japanese, but the Russian troops crossed the river at night under a heavy fire and carried by storm two ravines and five rows of trenches. The Japanese in the redoubt fired on their own men as they retreated from the first trenches, supposing them to be the Russians. A similar accident took place on the other side, for the Russians storming the front of the hill fired on a body of their comrades who were circling the Japanese flank. The Japanese defended their positions with hand grenades, and in many cases died to a man rather than surrender. Over 1,500 Japanese were buried on the hill. The Russian soldiers quickly appropriated the warm clothing on the Japanese corpses. Probably it is on account of this propensity of the Russians to pick up good clothing anywhere that has caused the Japanese Government to protest through the American State Department against the use by the Russians of Japanese and Chinese clothing as a disguise in approaching their lines. The Russian flanking column on the left, which had been sent under General Mistchenko to turn the Japanese right, fought for four days in the mountains about Tumin Pass, where the Japanese were very strongly intrenched in the rocky defiles and ridges, but were finally forced to retire to the northeast and barely escaped being cut off. A small body of Russians are reported south of the Taitse River east of Liao-Yang.

Execution of Captured Brigands at Mukden

Income and Family Protection

HOW MUCH OF A MAN'S INCOME SHOULD BE SET ASIDE TO PROTECT HIS FAMILY AGAINST THE ADVERSE CONTINGENCIES OF LIFE AND DEATH?

BY RUFUS W. WEEKS

VICE-PRESIDENT OF THE ACTUARIAL SOCIETY OF AMERICA

THERE is always a gap between the ideal and the practicable, partly because people hardly ever prefer those things which are really best for them. It follows that the main business of the preacher, the doctor and the life insurance man is, first, to find out what is the nearest to the right thing which people can be induced to do, and then to get them to do *that*. A study of the right thing itself has, therefore, the look of unpracticality; yet such study is at least worth while as an intellectual pastime, and it does have practical value, for it helps a little toward moving the line of the practicable toward the ideal.

Let us then consider the case of the typical young man who has begun well in business life; and let us study, first, what precisely it is that he needs which life insurance can furnish; second, why he does not want, and cannot be made to want, the precise thing he needs; and, third, what is the nearest to the right thing that he can be made to want and to take.

Let us suppose that the young man is 30 years old; that he has a wife of the same age; that they have one child and propose to have not to exceed two more —three children being a "long family" (to use the Devonshire phrase) according to the modern scale. Let us suppose further that the man has a permanent place and is receiving a salary of $3,000 a year.

First, then, what does such a man need as protection against unfavorable contingencies of life and death for himself and his family; and what share of his income would it take to provide this needful protection?

The plainest chance against which a provision is needed is the chance that the young man may die and leave his wife a widow. The husband will admit if pressed that in that case his wife ought to be secured an income for as long as she lives of at least $60 a month, or $720 a year. A life insurance company could be found which would assume this obligation for an annual payment of $192. This is the lowest price at which this obligation could be purchased, and the arrangement would return nothing to the husband in case the wife should die first. The annual payment would be merely so much money spent every year out of the man's income—spent, as we may say, for the comfort of mind of himself and his wife in knowing that her future livelihood was certain. It may be objected that there is no need of securing to the possible widow an income absolutely for life, since she may very likely marry again. This is true, and if an insurance company could be found which would sell a future income for the wife, to begin only in case she became a widow and to continue only as long as she remained a widow, for a lower price than the income to continue for her life, then no doubt the lower-priced article would fill the requirement. There is, however, no life insurance company which would sell this kind of contract, and, even if there were, the statistics of remarriage of widows indicate that it would not be safe, even theoretically, to deduct more than 10 per cent. from the price in consideration of the cessation at remarriage. Practically, therefore, in order to meet the reasonable need of the wife that she should not, if she becomes a widow, be placed in the position where she must marry for a living, the contract we have proposed is necessary.

The next person to be considered is the child, whom we will suppose to be one year old. The father will admit that the child ought to be secured, in the event of his dying while it remains a child, a small

income—enough to secure education and maintenance until the age of 21. This income should certainly not be less than $20 a month, or $240 a year, and a life insurance company could be found which would assume this obligation for a payment of $32 per year for 15 years.

Upon the birth of a second child the same protection becomes a necessity for it also, and for this a life insurance company would charge $33 per annum, the father being then assumed to be 31. On the birth of a third child the same need would arise for it, and would call for an annual payment from that time on of $34 for 15 years.

Thus far we have dealt only with the grim side of the problem, but there remains the cheerful probability that the young man's life will run its natural course. The chances are two to one that he will live to become a sexagenarian. Looking forward to that far-off probability, the young man reasonably feels that sixty is the *ultima thule* of active life, that at that point must begin his time of permanent leisure. This can be made certain only by his providing for it during the intermediate years, beginning at once. It will most likely seem to the young man that he can live in comfort after his working days are over on an income of half his present salary—an income, that is to say, of $125 per month, or $1,500 a year—and that this would include an adequate support for his wife, if she should also survive to the same age. A part of this income, say, $200, could be secured from a life insurance company, by continuing the annual payments of $99 set free as the three children reach the age of 15, but for the remaining $1,300 of future income he must begin to provide at once, and for this the company would require an annual payment, beginning at the age of 30, of $250.

Five contracts in all, as will be seen, are called for in this sketch of what is needful, three of them to begin at once, the fourth after one year, and the fifth and last after three years. The three which are to begin at once would require an entire annual payment of $474; the fourth contract, to begin after one year, would bring the total annual payment needed to $507, and the final contract, to be entered into three years hence, would bring the total annual payment from that time on to $541.

These five contracts together would guarantee what is needful in the case of the main contingencies of life and death. There is, however, one chance which they do not provide against, and this is the possibility that the health of the breadwinner and his capacity for making an income may break down permanently, and yet that he may live on a considerable time after. This frightful disaster happens very seldom; for, as a rule, and happily so, a man dies within a year after his health has permanently given way. It is a defect in the practice of insurance in this country that as yet this particular contingency is not insured against—the special difficulties in the way of assuming this risk could undoubtedly be got over if the attempt were made in earnest.

The second question we were to take up is, Why the typical young man does not want, and cannot be made to want, the precise thing in the way of protection which we have outlined as being the real need of the case. That he does not want what he needs is certain. It would be a safe even bet that not one young man in the whole country will walk into a life insurance office with this number of THE INDEPENDENT in his hand, and ask the company to sell him the kind of protection here set forth. The causes of this failure of a man's wants to match his needs are two—the first being a thoroughly human and natural trait, and the second being a trait not so wholesome. The young man does not really *feel* it to be possible that he may die; and this is well—it is in the order of nature that the healthy human being should ignore his mortality. It seems to be the intent of nature that the casualty of death should not be an economic disaster; that the manhood of the nation at large should in some collective fashion, and as a matter of course, take care of the widows and the orphans. Such an arrangement would be the simplest and healthiest all around; but in its default the indifference to the possibility of death which is instinctive with the healthy animal, man, does work disaster, which it is the business of the life insurance man to the best of his ability to forestall.

The other trait which would make it

impossible to induce the typical young man with a good income to buy precisely the right kind of protection for his family, is that this young man has the commercial habit of mind. The one motive which suggests itself to him as sensible is the desire for profit; and the one image which has an alluring look is that of himself on some future day handling a sum of money well up in the thousands. This is the image which the life insurance man must hang in the air, if he is to make the young man want nearly what he needs.

Thus we reach the answer to the third part of our problem. The keyword is "investment," and the agent must know how to use it, and to make vivid the picture it calls up, adding, in casual touches put in at the right moment, the part of the wife and children. Moreover, the golden picture must be shown not down too long a vista of years—three decades is too far a remove to appeal to the ardent commercialist; no period longer than a score of years can touch him.

Certainly not more than one-sixth of the young man's income can the agent divert into the "investment" he is urging—charm he never so wisely. What, now, has the agent to offer for this $500 a year, and how does it compare with the ideal protection, which, as we have seen, would cost $541 a year?

Choice may be made among three standard offers, which we will call A, B and C; each offer promises that if the young man dies within 20 years a fixed sum will be paid to the family, and that if he lives out the 20 years a sum will be paid to himself, the minimum of which is fixed. The range of these several promises is as follows, in round numbers:

Offer A: To the family $20,000; or to self, minimum of $5,500.

Offer B: To the family $15,000; or to self, minimum of $8,000.

Offer C: To the family $10,000; or to self, minimum of $10,000.

The insurance company reckons the three offers as of identical value—a decrease of the promise to the family being offset by a mathematically equivalent increase of the promise to the insured; but, of course, they do not appeal alike to our young man. If his conscience gets to work, it will point him to A, while his business mind will draw him to C; and we may as well assume that he takes B which, in fact, represents the average choice.

Having accepted the offer, and paid his first $500, he is now sure that if he dies before he is fifty the sum of $15,000 will be paid down at once to his wife, if she is then living, or, if not, to whomsoever he may have appointed to take care of his orphan children. But, now, the securing to the widow of a lump sum, however large, does not really meet her need for a life income; for it is practically certain that she will act on the advice of some man in the investment of the money, and an advance guaranty is needed of the honesty and good judgment of this unknown man, in order to make the promise of a single payment as safe as the promise of an income. If the young man insuring is wise on behalf of his wife, he will think of this, and will bind the insurance company not to pay down the $15,000, but to dole it out to the widow in fixed annual payments, and this the company will agree to do, and to add three per cent. interest each year to the sum in hand. Under this agreement the widow would receive in lieu of the $15,000 a yearly income of $750 throughout her lifetime; and, if she survived her husband less than 25 years, then the $750 a year would continue to be paid to the survivors of the family until 25 years had gone by from the death of the insured.

How does this provision for the widow compare with that called for by the ideal protection first sketched? Until all the children are of age, the ideal protection does much more than this insurance B; for, as against the $750 income furnished by B, the ideal protection gives, if three minor children are living, $1,440 a year; if two minor children are living, $1,200 a year, and, as long as one minor child is living $960 a year. After all the children are of age, the ideal protection gives the widow $720 a year, substantially the same as the $750 given by B. Averaging these various statuses, we may say that B does about seventy per cent. as much for the widow as the ideal protection would do.

But let us suppose that the young man insuring at 30 lives to be 50—and the

chances of this are four to one—and that he now sees the golden promise made to himself become reality. The promise was that he should receive a sum of money, at least $8,000, and very likely as much as $12,000. The excess over the guaranty was called "profit," and the uncertainty as to its figure gave just that tinge of gambling to the transaction which is so attractive to human nature.

It is next to a certainty that our friend, now 50 years old, has the opening for his $12,000 already decided upon before he "touches" the money. Let us allow that his investment is a good one, and pays five per cent. annually; then our friend has $600 a year at his disposal outside of his salary, and, supposing he continues to live on $2,500 a year, there will be in all $1,100 a year which he could, if he chose, pay to a life insurance company. The omniscient agent has reckoned this out even before our friend, and has fixed upon the offer to be made. This time it must clearly appear as investment, and therefore must be of the form C; the vista of years is shorter, too, and cannot be stretched beyond ten. For the $1,100 a year, the offer is a promise of $10,000 to the widow or estate if our friend dies before he is 60, with a promise of a sum, the minimum of which is $10,000, and the likely amount of which is not less than $12,500, to be paid to our friend if he lives to be 60.

The protection of the possible widow during these ten years, from 50 to 60, is potentially much greater than that which the ideal scheme would have given her; for, as against the life income of $720 under the ideal scheme, the $12,000 left by the husband, plus the $10,000 insurance, would buy the widow a life income ranging from $1,200 to $1,700. The children, now grown up, do not enter into the case in this comparison of the two schemes.

Let us take it, however, that our friend is living at the age of 60, and has in hand the entire $24,500 with which to provide future support for himself and his wife. He can turn this sum over to a life insurance company, which will, in return, pay him an income of $1,600 a year for his lifetime, and, if his wife is living at his death, pay her an income of $900 a year for the remainder of her lifetime. This, it will be seen, does better for the wife than the "ideal" scheme, and a little better for the man himself.

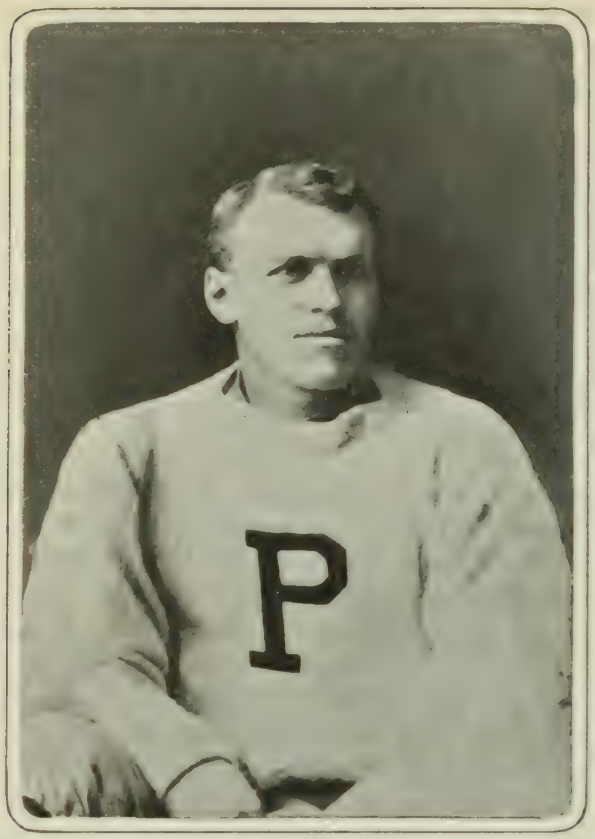
For the sake of simplicity in calculating, we have assumed in this sketch—what would not be usual—that a young man of so much ability as to be receiving a salary of $3,000 a year at 30, stays at that figure throughout his working years. The probability, of course, is that such a man would be receiving a higher salary in middle life; but this does not disturb the accuracy of our conclusions; for, as the man's income rises, so will rise his standard of minimum thinkable comfort for himself and his wife, and the same proportion of the income will be called for in order to provide for the need felt.

To sum up: We find that, for an outlay of one-sixth of a good income life insurance can furnish a fair approximation to that protection which is actually needed against the chances of death and of old age. The provision thus furnished is defective in the earlier years, and relatively excessive in the later years; but it is attractive in form, and this last is essential. In a world of second bests, we shall hardly find a closer solution than this to any problem of human practice.

NEW YORK CITY.

The Eleven Greatest Football Players of America*

BY WALTER CAMP



[Mr. Camp is generally considered the greatest authority on football in the United States. He is the athletic adviser at Yale, where from the time he played on the team as an undergraduate to the present he has been in the closest touch with football affairs. Mr. Camp has always stood for purity of sport, and his influence upon athletics at Yale and throughout the country has been very great. The following article is copyrighted, and no quotations can be made from it without our permission.—EDITOR.]

IN considering the candidates for positions on a selected team of the last fourteen years, the names that rise before one's mind are so many and the feeling that each one was a star in his time grows so strong, that it is almost impossible to make a selection. And were we to go back to the introduction of the Rugby game in this country and take into consideration those giants of the game's early history, our readers would need a long memory to follow. Think of the men whose work was of such a kind as to make a lasting impression on the positions in which each played! Of the ends, going back to the days still talked of when Harding, of Harvard, and Wallace, of Yale, exchanged courtesies, call to mind De Camp, Bryan, Trenchard, Cochran and Poe, of Princeton; Thatcher, Cowdin, Hallowell and Cabot, of Harvard; Moorhead and Knapp, of Yale; Gelbert, of the University of Pennsylvania; beside all those in more recent years—Shevlin, Bowditch, Henry, Davis, Rafferty, Farnsworth, of West Point; Sweeley and Redden, of Michigan, and Farmer and Bullock, of Dartmouth. And these are

* Copyright, 1904, THE INDEPENDENT.

M'CLUNG AND HEFFELFINGER, Yale

COWAN, Princeton

only the men who have made one position notable.

Of tackles, nearly as great a number of well-remembered faces appear. Bertron, Gill, Winter, Wallace, Rhodes, Murphy, Chamberlain and Stillman, of Yale; Hector Cowan, Lea, Church and Hillebrand, of Princeton; Newell and Waters, of Harvard; Foy and Bunker, of West Point; Wheelock, of the Indians; Outland and Wallace, of Pennsylvania; Steckle, of Michigan; and, in the more recent teams, Hogan, Bloomer and Kinney, of Yale; Pell, of Princeton; Maddock, of Michigan; Schacht, of Minnesota, and Knowlton, of Harvard.

In guards, think of the giants of that position, Heffelfinger, Glass and Brown, of Yale; Hare and Wharton, of Pennsylvania; Riggs, Wheeler, Riggs and De Witt, of Princeton; Perry Trafford, Cranston and Lee, of Harvard. These are the overshadowing names, perhaps, but there are plenty more not to be forgotten. O. D. Thompson, Ray Tompkins, Ben Lamb, Storrs and Hickok, of Yale; Ned Peace, Holly and Taylor, of Princeton; Woodruff, of Pennsylvania; Trout, of Lafayette; Warner, of Cornell; Whitmore, of Brown; Lerum, of Wisconsin; Goss and Sheldon, of Yale, and Marshall, of Harvard.

At center, Brooks, Lewis and Doucette, of Harvard; Bland Ballard, George and Gailey, of Princeton; Adams, Bull and Overfield, of Pennsylvania; Jack Harding, Louis Hull, Peters, Corbin, Stillman, Olcott and Holt, of Yale; Boyers, of West Point; Cunningham, of Michigan; Hooper, of Dartmouth, and Wright, of Columbia.

At quarter-back, there are King, Baird and Poe, of Princeton; Daly, Dean and Wrenn, of Harvard; McCormick, Adee, Fincke and de Saulles, of Yale; Kennedy, of Chicago; Wyckoff, of Cornell; Hudson, of the Indians; Weekes, of Michigan; and, finally, a host of clever ones in the present time—Rockwell, of Yale; Johnson, of the Indians; Witham, of Dartmouth, and Harris, of Minnesota.

Of half-backs, Bob Bacon, Bob Winsor, Keith, Kendall, Porter and Boyden, of Harvard; the Bakers, Dodge, Lamar, Loney, McNair, Moffat, Black and Channing, of Princeton; Baker, Hatch, Watson, Richards and Terry, of Yale, of old-time fame; Lake, Lee, Corbett,

HINKEY, Yale

BUTTERWORTH, Yale

Brewer, Wrightington, Dibblee and Kernan, of Harvard; Morse, Reiter and Kelly, of Princeton; Outland, Knipe, Osgood and McCracken, of Pennsylvania; Morley and Weekes, of Columbia; Seneca, of the Indians; Bliss, Thorne, Sharpe and Chadwick, of Yale; while of the latest there are Heston, of Michigan; Kafer, of Princeton; Metcalf and Mitchell, of Yale.

And for the final place, one may pass in review a line of players, not giants, but the most skillful of all—from Bacon to Bull, of Yale; from Harlan to those wonderful kickers, Ames and Homans, of Princeton, and Sears and B. Trafford, of Harvard. Then, in later days, Thayer, Brooke and Minds, of Pennsylvania; Butterworth, McBride and Hale, of Yale; Hirschberger, of Chicago; O'Dea, of Wisconsin, and Graydon, of Harvard.

The selection of "All-America" teams seems to have become a mania, and the only excuse that I can put forth for further contribution is that of habit, for in 1889 I first introduced the idea and selected the first eleven. I had no sensation of guilt at the time, nor for the next few years. Now I begin to feel I owe the public an apology.

When asked to select an All American team of the All American teams—that is, to pick out the stars of such a galaxy of players as have made names for themselves on the gridiron since the original selection of this kind—the task seemed at first impossible. And it is impossible if one were to guarantee that this team, when finally chosen, should be able to work together and be successful without considerable practice. Having seen an all-star aggregation at New Haven on the occasion of the Yale Bi-Centennial, altho it included players as far back as those who represented Yale teams in 1875 and 1876, actually smother the regular second eleven of the University, I believe that even such a team as this might be able, after some practice, to get together and play a powerful game.

Nevertheless, the present selection is intended to cover more nearly the men who are regarded by football enthusiasts as the best men who have played at the various universities during these many years.

KELLY, Princeton

LEWIS, Amherst and Harvard

One end would be Hinkey, of Yale, who was the choice for that place on the All-America teams for four years. There is no other man who has covered that position in such a way as to be thus chosen or recognized.

The other end would be filled by Campbell, of Harvard, who was the choice for the All-America teams for three years. Both of these men were captains and successful captains.

Frank A. Hinkey, of Yale, was one of the most remarkable ends that ever played the position in this country. He was on the All-America teams of 1891, 1892, 1893 and 1894. He secured his position at Yale when a freshman, and altho he was by no means athletic in appearance nor of muscular build, he displaced all the other candidates. This frail appearing man, weighing but 147 pounds, was probably the most feared by his opponents on account of his ability to diagnose and get through any kind of interference that was sent against an end. In addition to that he possessed that most valuable characteristic of an end, intuition as to where the plays were going and ability to be always on hand when the ball came down. His career was one of steady progress, resulting in his final captaincy of the Yale team.

Campbell, of Harvard, was the choice of the All-America team in 1899, 1900 and 1901. He was a man of muscular build, altho not as heavy as some of the more modern ends which the recent changes in rules are developing, but he was very powerful and fast in getting down the field. His especial forte was in assisting his own runner in attack, and in this he stood out above all other ends of his time. In fact, it is upon this quality that he would be given the place. There were few ends who might match him in defensive work or in getting down the field, and none of them were quite his equal in tackling, while his particular ability to always be with his runner, whether in striking the line or after the runner was through, and his strength in dragging that runner along, meant many yards for his team.

For one tackle there is Newell, of Harvard, who figured as the star tackle of three All-America teams.

The other choice would be Hector Cowan, of Princeton, a captain and one of the most powerful men who ever played the position. He figured on the All-America team the first year of this roll of honor, but would have filled the place in the previous years had there been such selection made.

Newell, of Harvard, was one of the

NEWELL, Harvard

Crimson's best beloved football players. He developed in his very first season, was aggressive and fast and soon showed such caliber as to make him a star. He was heavily built, very powerful, and loved the game. He was especially good in breaking up interference and reaching the runner, and had he played in the modern day of tackle back formations would have been a star in the offensive game. He was a good ground gainer in the so-called momentum mass plays.

He was on the All-America teams of 1890, 1891, 1892 and 1893, and was the star of that position during the years when he played. Waters, his team mate, demonstrated later that he would probably have made quite as capable a tackle as Newell, but he was used as guard one year, and then another year, when he was captain, was injured so that he was not at his best.

DALY, Harvard and West Point

Cowan was the wonder of his day. He filled the position of tackle for Princeton as no man had ever done before and as has hardly been done since. In the first place, he was in physique the superior of almost any man he was likely to face, and that physique was backed by an indomitable spirit. It was well nigh impossible for the opponents to bring off plays in his vicinity, and on the attack he developed into Princeton's main stay, so that on one occasion it proved fatal to them when in the game with Harvard in the first few minutes of the play, Cowan, in tackling a man, slipped from the runner's knees to his ankles and was ruled off for foul tackling. Princeton, deprived of their captain and best man, lost the game.

For guards the choice would be Heffelfinger, of Yale, selected for the All-America teams of 1888, 1889 and 1890, and that phenomenal guard, Glass, of Yale,

Truxton Hare, of the University of Pennsylvania, in the All-America teams of 1897, 1898, 1899 and 1900, under other conditions would undoubtedly have been an equal selection to these two, and would have been chosen as many years as he played on any first-class team, but he was not played as a guard, but in most of Pennsylvania's big games was called upon to do practically all the running (all, at any rate, that was effective) with the ball, and on defense to run out from his position at guard and tackle men who got around the end, and, finally, added to all this, he was called upon to do the punting. A man with such versatility, if he had ten good men with him, would have been able to pull out a good many victories for his team, but forced to do all the work himself, and with poor support, it was more than could be asked.

Gordon Brown, of Yale, also a selection for four years on All-America teams, would be chosen without a doubt were it not for the phenomenal giants already noted.

Heffelfinger, of Yale, has stood out for years as the king of the guard position. He was a most powerful man in build, without any superfluous flesh, and was a remarkably fast runner. So fast, indeed, that at one time, when Yale was in great difficulties as to the question of securing an end, the project was considered of playing Heffelfinger at the end of the line, and he was quite fast enough to per-

form the work, being even from his position in the line one of the first men to get down the field under kicks. He was not only a strong player, but a strategic one, and he had studied the possibilities of his position until he had made far more of it than had ever been made before. He was not used in running with the ball, because Yale's system has always been based upon the idea that the guard, if he perform his work properly, has so much to do, especially in defense, that it is hardly worth while to exhaust him unduly by giving him more running to do on the attack.

Glass, of Yale, was on All-America teams the only year he played, and was the reliance of the Yale line in that year, always being ready, fortunately for himself and the team, to perform a good deal more than the lion's share of the work. Like Heffelfinger, he carried no superfluous weight, but was a big, powerful man, with tremendous speed and willingness. In contests in which he played he was easily the most marked man on the field, and in both attack and defense playing such a game that his fame traveled wherever the sport is played.

Center is a more difficult position to select, but Lewis, of Amherst and Harvard and the All-America teams of 1898 and 1899, has a shade the better of it, when everything is considered. He was an accurate passer, strong in both attack and defense, and particularly active. Corbin, of Yale, would have been chosen, but the day of his superiority antedated these selections.

Lewis was not so heavy as some of the noted centers, but from the fact that he was thus a lighter center the development of the position with him was toward activity and quick gettting down the field, rather than to fixed stability. He was a great student of the game as well, and did much to advance the work of that position.

Holt, of Yale, and Hooper, of Dartmouth, of recent centers would have pushed Lewis closely.

For quarter back, Daly, of Harvard and West Point and the All-America teams of 1898, 1899 and 1900, and, skipping one year, for two years following practically the sole winner of the West Point-Annapolis game for his side, has the longest and most phenomenal record of any of the quarters. Beecher, of Yale, one of the best remembered of quarter backs, antedated the selection of All-America teams.

GLASS, Yale

This young man Daly needs little description to the general football public. Weighing about 150 pounds, active as a cat and cool in the most trying situations, Daly was, at his best, all that could be asked of any man in the position. A marvelous power in running in a broken up field, a very good punter on emergency, and a drop kicker as well, he combined the attributes of the best quarters of his time or any time. And this is in spite of the fact that in his final year at Harvard and the year of his own captaincy his

showing was mediocre. This was due to circumstances over which Daly, save as a captain, had little control, and cannot be reckoned as against his remarkable showing both at Harvard and West Point in other years.

In the back field, McClung, of Yale, of the All-America teams of 1890 and 1891, was the best, all things considered, of any of the men who stood in the position.

Kelly, of Princeton, and the All-America half back of 1896 and 1897, would make a fitting mate to McClung, while the full back position would go to Butterworth, of Yale, and the All-America man on the teams of 1893 and 1894.

CAMPBELL, Harvard

Brooke, of the University of Pennsylvania, would run Butterworth very close on the kicking. Bull, of Yale, it will be remembered, was, like Corbin, before the day of All-America selections, Hirschberger, of Chicago, and Mitchell, of this year's Yale team were both wonderful kickers. But no one of these men could equal Butterworth in the strength of his running game, and, therefore, Butterworth gets the place.

McClung was a thickset, stocky man of just the right disposition for the sport. In his first year's appearance on the gridiron he was a remarkable dodger, but with his peculiar method was likely to get caught from behind while he was dodging a man. For this reason he determinedly practiced getting more speed, and in his next season he had combined speed with his dodging ability, and had studied out the proposition until his style of running was especially effective. In the first place, he started quickly and ran very hard. When added to that was the fact that as he approached a would-be tackler, while his feet still kept practically the same line, he would swing his body in such a way to one side as to make the man think he was going on that side, and yet, still keeping all steam on, go straight ahead, it is no wonder that he made so many yards. In one game, notably the one at Eastern Park, Brooklyn, against Princeton, Yale, very largely through the medium of his running, ran up no less than 32 points. McClung was easily one of the best of his day on defense, and finally, as a captain of the Yale team, showed his thorough understanding of the theoretical side of the game.

Kelly was also a thick set, quick starting hard runner. He made less of dodging, but struck with great force, and kept his feet well behind interference. In one game at New Haven, when Yale had practically won the game, Kelly fought so desperately toward the end that almost by his own efforts in repeated plunges into the Yale line he carried the ball from Princeton's territory well into Yale's territory, and for a time it seemed as if Yale's line would be unable to hold him. It was that particular power of concentration of every ounce of strength into a single effort that made Kelly such a power, for he was slightly lame, and this interfered with his highest speed, altho it is fair to confess that the speed he displayed was quite up to the standard of running halves. His defensive play was perfect and his judgment first-class.

Butterworth was strong in the legs, followed interference well, and at the time when his game was at its hight Yale was

using a play similar to wedge on tackle, and in this Butterworth was invincible. He hugged his interference closely, and as they struck, pushed on with them, and if they went down seemed to have a peculiar ability to surge over the mass and keep his feet at the same time. He could also bring off an end run under favorable conditions, and was a most reliable kicker, growing better and better under adverse circumstances. The more he was driven back into his own goal the farther he seemed able to kick the ball out past the middle of the field. On defense he was steady and sure. He was, in fact, the concentration of Yale spirit and showed it in his every play.

New Haven, Conn

My Logging Team

"OLD CHARLEY"

BY EDWARD CLARKE

It was not mine. I was but ten years old. But I appropriated it by virtue of possessing the greatest capacity to appreciate it and enjoy it. By this same power I have made mine many a noble landscape and lordly view, mine in a sense more real than ever it could be the owner's.

My team—they were four farm horses, hitched tandem in pairs to a great log-wagon, and driven, not from the wagon as a four-in-hand, but by a rider on the nigh-wheeler, which carried a saddle in addition to his harness; and driven they were by a single rein, known to plowmen as a lead-rein. In this saddle sat a ten-year-old boy—the proud driver of the team. The single rein passed from the nigh-leader's bit back loosely to the hames of the saddler, where the slack could be caught up at will by the driver. This, with the voice of the driver and the vicious crack of a long black-snake whip, was the means of inducing forward motion. For checking this motion, there were the yoke-chains from the collars of the wheelers to the front end of the tongue, reinforced by mighty hip-straps, in which the knowing wheelers would veritably sit and slide down steep hills with braced legs holding back the heavily loaded wagon. There was a great log-chain also which the men who rode and walked behind would throw around spoke and rim of a rear wheel and lock it securely to the frame, forcing it to slip instead of roll down the incline. There was no further provision for controlling the impulse to run away which a frosty morning and a mettlesome team might conspire to render tempting.

My team was composed of two blacks and two sorrels, and that was all to an onlooker; but to me, a ten-year-old boy, and to me now after the lapse of forty years—more or less—they were and still are four individuals with personalities as well marked and as well worth knowing and loving as any four men and women I have since met. I do not suppose I can acquaint you with them. I was ten then and I have been knowing them these years. The saddler, or the nigh wheeler, and the off-leader were two black horses that matched well enough to draw the Mistress' carriage in span, and in their silver-mounted harness, hitched to the shining carriage, they gave no suspicion of so plebeian an occupation as logging, —when they drew me. Yet how different were these two blacks! Touch, the saddler whom I bestrode with my short legs in the stirrup straps, not reaching the stirrups, had the simple dignity that ranked him head of the house. Doing the double duty of a wheeler and a saddler, the honor of carrying the driver he never forgot. He even trotted more

easily with the empty wagon, as became a saddler, despite his burden of heavy pole harness with straps four inches wide. Ponch was known and treated as the "Missus' horse." The white star in his black face and the white left hind foot proclaimed his patrician ancestry and never did I know him to lay aside the dignity that seemed a part of him. His name was called as if spelled *P a u n c h,* but I think in full it was Pontius Pilate, and he lived up to the dignity of that high name. His mate, when Mistress rode in the carriage, was Jack—my off-leader; a horse lighter in weight, coal black, unrelieved by star or white foot, and wicked—how wicked the stable men left us to guess, only warning us never to trust him. How well was he named! You could by no stretch of the imagination have called him Ponch, or his dignified mate Jack. There was no rein to control Jack in his wickedness in my team. A hickory pole an inch in diameter and four feet in length, called the jockey-stick, fastened at one end to the hames of the nigh-lead and at the other end to Jack's bit, pushed and pulled him into unison with the nigh-leader, tho never failing to rouse his bad temper; but there was the black-snake! He was hitched diagonally from the saddler and most convenient to the whip-hand of the saddler. Everything that was wrong in the team, justly and unjustly—tho usually the former, was charged to Jack. All the swearing of the men was directed toward him, and he gave it back with hoofs and teeth in language that could not be mistaken. Which was cause and which effect in Jack's disposition and the men's treatment of him, I have never known; but I should hesitate to name a child Jack.

The two sorrels were also placed diagonally as off-wheeler and nigh-leader. The reader who is inexperienced in these terms designating the members of a four-horse team, borrowed as they are from the English custom, where the driver sits on the left, and therefore misnomers to our American custom, may draw a diagram like the figure X, to show the diagonal lines of color, black and sorrel, of my team. At the lower left hand corner place Mr. Ponch, the black saddler, as nigh-wheeler; at the upper right hand corner place Jack, the black off-leader. Now come the sorrels: at the upper left hand corner place Queen, a chestnut sorrel mare, as nigh-leader; at the lower right hand corner, Old Charley, the sorrel off-wheeler. Draw a straight line between the two upper corners to represent the jockey-stick controlling the off-leader; a straight line from the upper left hand corner to the lower left hand corner to represent the check-rein of the driver, and a curved line from the lower left hand corner to the lower right hand corner to represent the loose hitch-rein from the bit of the off-wheeler to the hames of the saddler that might be caught up by the driver to compel the loose wheeler to do his share of holding back on the steep grades. These were the means of controlling the four and making them move as one under the will of the driver, aside from his voice and the persuasive black-snake.

The two sorrels are yet to be described. Queen was the leader of the team. I see her now. Is she living somewhere? A chestnut sorrel, rounder than Jack, with the disposition of a high-bred lady. It was her intelligence that translated the short jerks of the single rein and the sharp command, Gee, into a turn to the right, forcing Jack over by the jockey-stick in spite of his kicks and bites, and swinging the wagon tongue, to whose front end they were hitched, a sign which the wheelers instinctively followed if they would save their legs from the swinging tongue. She translated as readily the steady pull and the command, Haw, into a turn to the left, dragging Jack this time and the whole team after her. She enforced discipline in the team and in the pasture, and could raise her dainty foot in displeasure at the blunders of her team as well as at Jack; but never at her driver or the stable man. She was too much of a lady for that. Old Master had brought her from the Belle Meade Farm to lead this team, instead of winning the applause of thousands on the turf. She was a thoroughbred beauty and she knew it, but it did not spoil her. The whip had never touched her, nor would. "Queen!" The one word was a lash, and all she had was at her driver's disposal. What would have happened if she had been struck? We never knew. One thing

that would likely have happened pretty quickly is a fight with any man on the place that witnessed the outrage. Strike Queen! Didn't she know more than any driver that ever flourished a whip? Even young Master in his most reckless moods would draw the line at that. It was Queen that brought him home safely many a night when he could scarcely guide her. Strike Queen, indeed! Why, the night the burglars stole the wheat from the barn, was it not Queen who carried the young Master hot foot on the trail fifty miles, the next day, before they could market it? Who but Queen could have done that, and she not hurt by the ride. Young Master drove her to buggy sometimes, not the Mistress' buggy; that stood in the stable carefully covered and was used only by her, and then drawn by the blacks with the silver harness.

Queen—but why tell you more about Queen? Mistress of her team by virtue of her birth and breeding, she was a queen in her own right. At the water trough, at the stable entrance, at the pasture bars it was always "ladies first" with the team. The three stood back respectfully, even Jack showing his manners, until the lady, with ears laid gracefully back and a little air of consciousness, stepped neatly through and waited, half-turning, to receive their homage. It was Queen that started the team at command. It was Queen that set the pace and put heart into her team in the heavy work. It was Queen—well Queen was the leader of the team. Pretty mare, I loved you! It was no virtue of mine that I never struck you. I never thought of it, and I loved to crack the whip as well as any ten-year-old boy. It was no virtue of the men's! It was a tradition of the place never to be violated. I think that was one of the Mistress's peculiarities—that, a widow and a recluse, her will was law to the remotest employee of the place.

These three horses were "to the manner born." You may wonder that they were ever made to do farm work. It was good for their health and manners as a matter of education for one thing. They would behave better when Mistress rode behind her blacks. But most of all was the principle of the farm, that work is ennobling, that service is for the highest and best—that horse or man must earn his oats. Only the harness was adjusted more carefully, kept softer with oil to prevent galling; the driving was more intelligent, no sudden starts or jerks to strain—that was all; but work, hard and plenty of it, would not hurt.

The last horse to be described is Old Charley, who names this sketch. He was the only farm horse of the four, hitched as the off-wheeler. A giant sorrel with blaze-face and four white feet, breaking the old rule:

"One white foot, buy him;
Two white feet, try him;
Three white feet, pass by him;
Four white feet, no horse at all."

Rather the adage, "Handsome is as handsome does," was the truth about him.

A powerful animal, patient, slow, faithful; of might, limp and huge girth, he was the stand-by of the team. It was not his to take the initiative. He was not a leader: he was the off-wheeler and a very handy follower with a heavily loaded log-wagon in a tight place. We depended on Old Charley down hill or up hill, and he never made any fuss about it. There was no style about him. His homely name well enough fits his character. Nobody on the farm would have ridden behind him in a buggy. Old Charley! he knew his business, too, in a way, as well as Queen. It was not to lead; he never intruded. He could play second fiddle, but I am to tell you about that.

We were hauling logs to the saw mill; one mighty oak, perhaps, that would make the wagon groan when its full weight settled down upon it; or three, or five ordinary logs girded with chains. The boy, riding in front and under the butts of those monsters, down steep descents with the wheelers sliding on their haunches, sometimes wondered if those logs should slip! He assured his mother, it is true, each morning when he desired permission to go with the team, that there was no danger; but himself needed reassuring at these moments of reflection. Such roads as we hauled upon — good, hard, graveled roads; but down, up and around the bends—I think I could not describe them

as I have the horses. There were short curves, first right and then left, that swung the leaders and fretted Jack; there were steep ascents that called for sudden rushes, and soft cuts that were heart-breaking. Yet we never injured our team, nor discouraged them—for that would have been injury irreparable.

I learned lessons from the management of that logging team: lessons of life which in after years have stood me in good stead in church and school.

There were breathing places in the long ascents which Queen well knew, where she would stop the team, giving warning apologetically to the driver, with nodding head and prettily poised foot, saying, "By your leave, sir." A fool might have yelled to them, "Go on," or have cracked the whip excitedly. I have seen it done many times since in many places, and it has always roused my indignation as surely as the jockey-stick roused Jack's. He would have been jerked out of that saddle quickly enough by the men, and I always long for one of Mr. Bergh's men to call down such drivers.

Queen stopped the team at the right instant and instinctively at the right spot. Queen would start it again also at the right moment when the team had blown. She would ask permission of the driver by certain little well-known movements and, signaling to the three, they would settle in their collars to the heavy tasks again. Happy team with a driver who understands! Splendid driver who knows that his team knows! Expert he who knows when to say, "Whoa!"

I have since seen ministers laboring with fretting churches, striving to drive them. Oh, if they would only stop, do nothing, hands off and down, wait; give the people a breathing chance, watch them signal for the start, give encouragement to their initiative! But they have never logged.

Sometimes the killing load would not come at the team's effort, and they would drop back shamed. Then the driver was ready. "Whoa."

The man behind had slipped a ready stone from his hand under the hind wheel and chocked it. The horses breathe nervously, standing on tip-toe; Old Charley swinging his heavy head, Jack pawing, Queen with one ear back waiting for the word, Ponch quiet under his rider. "Try the Gee swing," speaks the man behind, quietly. Here is a principle in physics, tho he does not know that; the front wheels turn on a point under the mighty load, swinging the hind wheels the fraction of an inch, but enough to overcome the awful inertia—they call it the "dead weight"—and start the wheels to rolling. Tho so small the arc at the wheels, way out at the circumference where Jack is, it swings him twenty feet off the road into the ditch and makes him rightly angry. He sees no sense in it and protests to Queen, but she does not notice him. This is the movement we are to try when a straight pull fails. The boy presses his knees against the shoulders of Ponch; the saddler gathers himself in response. A sharp twitch of the check rein, "Gee!" Queen comes to the right with a rush that carries Jack off the road and almost off his feet. Old Charley, last to move, settles down beside Ponch. The fire flies from the iron hoofs against the flinty gravel. A little the hind wheels move. Now straight. "Get!" The horses almost go down, but the wagon settles back. "*W h o a!*" Queen looks back and raises her foot impatiently. "W h o a!" See their barrels heave, their sides glistening in the sun! They stand at attention.

"Try the left swing," speaks the man from behind, still quietly. The boy is proud that there is no suggestion of displacing the driver in this emergency. He will repay the confidence. He shakes free the lash. There is now a lesson in physiology: there is something in the left side. The heart beats on that side. Then that is Queen's side on the team. They are coming her way this time. They all know it. She won't have to crowd Jack over this time. It is to be a left swing. She signals her team, Follow me! "Come, haw!" The whip cracks like a pistol now, and Jack jumps at the sound like a demon. Surely the straining chains will break! With a left rush that no football guard ever surpassed, they put their hearts into the struggle. They go down almost to their knees. Queen is confident of success. When did that left swing ever fail? As an avalanche

the four sway the trembling mass. It groans, yields, moves—but Jack falls down and the load settles back hopelessly. "*W h o a!*" Queen is heart-broken. She has no upbraiding for Jack's blunder. She has led them to defeat and it is bitter.

There is no excitement of driver or men. The man behind walks forward now and around the team, patting each one and speaking soothingly. He lifts the collars and adjusts the pads. This is no place for a nervous driver. Stalled? "*W h o a!*" The team stands a long breathing spell now, forgetting failure. They stand not nervously, but questioningly. The work now is man's. They have done all that horses can do. They look to the driver. Is he a good general? Has he stratagem? Can he inspire courage in fainting hearts? Or does he know only the whip and oaths—confession of his weakness? The team can be ruined forever in the next minuite. They can be made balkers in one effectual lesson.

Must the boy be displaced from the saddle? The man walks back, past horses, past the boy, behind the wagon to his place. The boy is thankful. Boy and horses are resting quietly now.

"Call on Old Charley!" comes quietly from the man behind. Who is this quiet, self-contained, wise general—this man behind, who speaks in quiet monosyllables and can trust a boy? Is he the owner of this estate and a man of affairs accustomed to rule? He is only a farm hand, rated at 20 a month and board. But the spell of "Old Missus" is upon his soul, and for awe of her he is a gentleman.

"Call on Old Charley!" Here is a lesson in ethics, or religion, or any depth of philosophy you please. Old Charley, the big, homely, blaze-face sorrel, ridiculous in his white stocking feet, stands swinging his head hopelessly. It is a trick of his. He is the pathos of the team. It is not his to devise ways and means.

Call on Old Charley! Must Old Charley take the initiative? I have said he never did. Is this plodding old plebeian to save the day for the team? "The stone that the builders rejected!"

Not Ponch's splendid stability, nor Jack's devilish quickness, nor even Queen's brilliant leadership — poor Queen—but just Old Charley's faithfulness!

"Charley!"—the boy turns in the saddle and the black-snake winds about the giant girth of the off-wheeler. The old fellow groans as if human, and then with superhuman effort goes down to his sacrifice,—down somehow, somewhere under that awful load, and, bracing himself, comes slowly up. The whole thing rises with him, it moves; he lift it and holds it alone! The three stand instant. "Now!" the driver calls, "Queen," "Jack," "Ponch"! The lash volleys like musketry. With knee, rein, voice and whip the boy drives. The three catch the load where Old Charley holds it. The dead weight is off now. They seize it and away they go with it. The slow sorrel catches his feet in time to join their conquering rush and the team is victorious! The boy sits glorious!

But was this a regular procedure? How often did you require this of the big wheeler? I fear to state how often Old Charley went down in troubles like this; I shudder as I think of it; but I can say that never was there failure when he went down, groaning.

This is the faith that moves mountains. The men had a tradition that something must come when Old Charley got down. If wagon and harness held, the load must move. If the load did not move, then the men said the tongue would come out! It always moved to my recollection.

Old Charley!

Must I point this moral and adorn this tale? No—thou standest for those who are faithful over a few things and who—horses or men—shall be made rulers over many.

Wellston, Ohio.

Why a Man Should Vote the Republican Ticket This Year

BY PAUL MORTON

Secretary of the Navy

I AM glad this question has been asked me. In 1896 the Democratic party, in National Convention, abandoned perhaps its chief cardinal principle—sound money—nominated a Populist for President, and declared for numerous things that the best element in the Democratic party could not stand for. It was freely proclaimed that the paramount issue that year was the free coinage of silver, and, without it, it was declared in most positive terms, there could be neither an increase in values of farm products nor any kind of prosperity. Free silver was voted down at the polls in November of that year and there followed prosperity so wonderful that it was without parallel in the history of the world.

In 1900 the Democratic party repeated its platform and renominated its candidate of 1896, and the latter announced that in that year the paramount issue would not be free silver, but imperialism; that there was great danger that the Republicans under the leadership of the late lamented William McKinley would turn this country of ours into a vast empire, and that the only way to prevent it was to defeat what he was pleased to denominate a designing and unscrupulous party.

Again, in November of that year the Democratic candidate was voted, by a large majority, to continue in private life at Lincoln, Neb. Four years have passed and we still remain a republican form of Government, with no probability of the star of empire shining in our midst.

In this good year of 1904 the Democratic party is again in the field; it has a new candidate, and the chief object of its convention held in St. Louis was to undo, and not mention, the things it had done in the two former conventions. Its platform does not speak of the paramount issue of 1896 and is almost silent on the paramount issue of 1900. Silence seems to have been the essence of that convention, both in regard to platform and as to candidate.

This year the Democrats announce they have no paramount issue as to abstract principles, but with much energy it is proclaimed that the paramount issue is to be a personal one. It is to be the Republican nominee for the Presidency, the man who now occupies the White House, Theodore Roosevelt.

The Republicans are just as glad to meet them on this issue as we were to meet them on the other paramount issues put forward by them in the two last campaigns; in fact, there is no issue that they could present which we would welcome as much.

They tell you that Theodore Roosevelt is a dangerous man; they tell you that Theodore Roosevelt is impulsive; they tell you that he is too ambitious, and that he will involve the country in a foreign war; they tell you that Theodore Roosevelt decides very important matters without mature deliberation; that he is much too quick on the trigger and that he goes off half cocked; they tell you that Theodore Roosevelt is not dignified; that he is a rough rider, a cowboy and big game hunter, a tennis player and all-around athlete; they tell you that his manners are brusque; that he does not treat statesmen and others entitled to it with consideration and distinction; in fact, if you have time to listen while they talk they will tell you most anything about Theodore Roosevelt, except they never say he is dishonest; they never say that he lacks intelligence, and they never say that he is afraid to do his duty, and they never claim that anybody owns him.

Why do they tell you he is dangerous? Ask them the direct question and they will answer you that he has done nothing bad yet, but some day they are afraid he will, and then they are quite

likely to follow it up by telling you that he is naturally too strenuous; that he believes in strife; that he likes war; that he prefers an agitated condition of government to peace and prosperity, and that he will not always follow the advice of Wall Street.

It is my great pleasure to know Theodore Roosevelt well, and I do not overstate the facts when I say there is not a man in the United States who is more anxious for honorable peace or for greater general prosperity than he is; he believes, however, that in order to maintain peace we should always be prepared for war; he believes in a well-trained army and navy, and he thinks that our navy, for its size, should be as efficient as any in the world.

Why do they call him unsafe? Because he does not believe in a Government with a "pull," and because he insists that the laws of this country shall be observed by the rich and the big corporations in just the same way that they must be observed by the poor man and the smaller corporation. He earnestly believes what he has so often said in his public utterances—that no man is above the law and that no man is below the law. It makes no difference however powerful and however rich a man may be, or however humble and however poor a man may be, they must both be within the law and both must observe it, and both are entitled to its protection. Is this an unsafe position for the President of the United States to occupy? Would it not be unsafe to the very Government itself if he occupied any other position on this subject?

They say that Theodore Roosevelt is too impulsive. Since a boy he has been and is still a great student of American affairs and American politics. Many things come to him as new every day which are mere repetitions of cases which he has already decided, which he naturally settles at once, apparently in an offhand, impulsive manner. It is my belief that no man has ever entered the White House as its Chief Executive—certainly no man in my generation—who is so well equipped by the study of American history and so well informed of the many great issues with which the President has had to deal, especially in connection with the legislative branch of our Government, as is Theodore Roosevelt.

Another reason why he is called impulsive is because, not for one moment, under any circumstances or under any conditions, will he compromise with dishonesty or be a party to an evil or deceitful transaction. He will not even listen to any such proposition, and it does not take him a second to decide a matter of this kind, and this alone is a very good reason why every decent citizen should vote for him as President.

To me Theodore Roosevelt typifies the ideal American citizen. He is fond of outdoor life, robust in health and honor, a strong advocate of the purity of the home, vigorous of mind, always courageous, leading out straight away for what he thinks is the best in private and public affairs; he varies neither to the right nor to the left. The President was born and bred a gentleman. He is dignified when it is proper for him to be so, and when he is at play, walking, riding, hunting or indulging in any other exercise, which any other reasonable man will concede he has a right to enjoy if he wants to, he is like any other man, and he does it in a way so natrual and unaffected that it commands the respect of everybody who knows him.

I have often heard Theodore Roosevelt say that he did not like to be called "the poor man's friend," or "the rich man's friend," or "the friend of the middle classes." He is the friend of every man who is decent, and his ambition is to be called "the decent man's friend," regardless of a man's property interest. He believes that every citizen is entitled to equality before the law. He does not believe in the "goody-goody" man, but he believes in the strong, forceful man. He believes that every man should take an interest in public affairs, and has very little respect for the parlor advocates of good government who never go near the primaries, or the timid man who is always afraid to do anything or express himself because he may hurt somebody's feelings.

He thinks every man should have a fair show, and I have heard him say that the man who was chucking coal into the fire-box of a locomotive at one end of the train had just the same rights and must

receive the same consideration in all matters of law as the railroad magnate who rides in his private car at the other end of the train. This, it seems to me, is the only kind of doctrine that we want preached or practiced in this country.

There should be no class distinction; there should be no arraignment of the masses against the classes. The man who undertakes to array the millionaires of the country against the hard-working, horny-handed sons of toil, or *vice versa,* can generally be put down as unfriendly to both and an enemy to his country. It is very fortunate and very true that in this remarkable country of ours the so-called "classes" have all come from the "masses." The millionaires of to-day, in most instances, were the poor boys of forty and fifty years ago. The boys of to-day have just as much opportunity to become the millionaires of the future as did the boys of forty years ago. Strict attention to business, unusual brain power and great energy and application is the only recipe that I know of to attain great wealth in the United States.

The President makes it clear that he recognizes the right of both capital and labor to organize, and he opposes nothing but the evil in the organization of either. There is no doubt in my mind that well directed corporate capital is a blessing to any country, and the countries in the world that are not now progressing in civilization are the countries that do not possess the benefits of corporate capital.

Labor and capital are as much twin brothers as the "Siamese Twins" were; a great injury cannot be done to one without causing serious damage to the other. Each, in order to be successful, must have the co-operation of the other; each should be tolerant and neither be tyrannical. It should always be the aim of capital and labor to work together, and wherever this has occurred great results have been accomplished.

I have only been a member of the present administration a short time, but I have found just what I expected to in that administration—efficiency, ability and honesty. I know how its movements are co-ordinated, adjusted and directed toward the end of the public good by the strong executive force which emanates from the White House.

I cannot close without saying something about the American navy. I have been severely criticised by some of the newspapers of the country because I have said that the navy of the United States should be the most formidable one in existence; I still hold to that doctrine. I do not mean by this, however, to say that the American navy should be the largest in the world. I differentiate between the words "formidable" and "largest," altho I think, next to Great Britain, we *should* have the best and most efficient navy on the seas. Our navy should be so formidable that it will discourage any other nation from wanting to pick a quarrel with us. It should be such a first-class fighting machine that no other navy in the world would desire an engagement with it. The American navy is a much more efficient navy than England had twenty-five years ago, and to-day it is making such rapid progress in construction and instruction that I expect to see it very soon second only to the navy of Great Britain. I believe that to-day, for its size, it is the best navy in the world. I know we have the best officers and the best enlisted men; I know that they are paid the best, clothed the best, fed the best, housed the best and can shoot the best, and I believe, should opportunity ever offer, that they will demonstrate to the satisfaction of every American citizen that they will fight the best. Theodore Roosevelt and the American navy have given the world to understand that, while we love honorable peace, and are going to do everything we can to maintain it, the American citizen and the American property anywhere and everywhere in the world will be protected, and to-day it is with a feeling of supreme satisfaction when traveling abroad to remember that you are an American citizen and to know, so long as you behave yourself, you are sure to have the vigorous protection of your own Government. This is another good reason why you should vote for President Roosevelt.

WASHINGTON, D. C.

Why Should a Man Vote the Democratic Ticket This Year?

BY JOHN SHARP WILLIAMS

DEMOCRATIC LEADER OF THE HOUSE OF REPRESENTATIVES AND CHAIRMAN OF THE DEMOCRATIC CONVENTION

I AM asked to answer this question in 2,000 words. To answer generally would not require so many words; to answer in detail a volume would not be time misspent nor space wasted. I will try to write with a 2,000 word purpose.

First and *Centrally*, because the Man has common sense and wants Peace. He will get from the Democratic party, and will not get from the Republican party, the assurance of several sorts of Peace: International Peace, Sectional and Racial Peace, Commercial Peace, Colonial or Philippine Peace, Hemispheric Peace and Industrial Peace.

JOHN SHARP WILLIAMS

First, International Peace. He will get an administration with moral courage enough not to praise war of any sort, nor to dispraise peace of any sort with the fear of being called "weakling." He will get an administration whose governing precept will be: "In thy right hand carry gentle peace to silence envious tongues"—tongues made envious by our wealth, intelligence, moral grandeur, industrial aptitude and territorial extension—in a word, by our strength; an administration whose governing precept will *not* be: "Carry a big stick and speak softly, and you will go far"—an administration which does not want "to go far" *that* way.

Second, Sectional and Racial Peace.

The *Fact:* Five years ago sections had ceased to be talked about; race hatred had come as near to the vanishing point as an hereditary thing can come. Now every Southerner who comes North feels and knows that Sectional arrogance is again in the saddle, and every man of every sort who goes South knows that race-hatred is more alive and more venomous on both sides of the race line than ever before in the history of the country, except during two or three years of reconstruction.

Cause: The revival by the Republican party, on the demand of the President, of the reconstruction spirit; this revival affecting the black man as a new birth of the hope of racial ascendency once given over, and the white man as a menace of the recoming of a condition of affairs thought forever to have passed away; the two resulting in a frightful increase of outrages on the one side and lynchings on the other, and in an industrial demoralization patently appearing.

Cause of the *Cause:* Inconsiderate speech and misleading political and social conduct by the present occupant of the White House.

Third, Commercial Peace.

The *Fact:* It is threatened.

Mr. McKinley had reluctantly come to see that "the period of exclusiveness has passed." Democrats, of course, don't believe that it ought ever to have existed. He had come to fear "reprisals" and "retaliations," and commercial warfare, for he said:

"The expansion of our trade and commerce is the present problem. Commercial wars are unprofitable. A policy of good will and friendly trade relations prevents reprisals." . . . "Reciprocity is in harmony with the spirit of the times. Measures of retaliation are not."

The spirit of the Continental press; Chamberlainism in Great Britain; preferential duties in Canada and France—all these and more—are proof that it was time for him and others to realize the actual condition.

The *Cause:* Chiefly that we had declared Commercial War against the world, had been carrying a big tariff stick, and ostentatiously flourishing it, until every nationality, little or big, except one, had concluded to go into the woods and cut it one.

The *Remedy:* Common-sense and amicable, Reciprocal trade relations with the world, saving, extending and deepening our markets, and creating new ones, especially for our farmers and other producers of "natural products." It is but a short step from Commercial enmity to Commercial warfare, and from the latter only a little longer step to flesh and blood warfare.

It is but a short step from recognized identity of commercial interest to mutual affection and helpfulness of all kinds. One might write a volume on this subject of difference between the two parties alone. Think out, reader, its stupendous import, especially as concerns the future of the United States and Canada!

Fourth, Philippine Peace.

The *Fact:* "Gentlemen may cry peace, but there is no peace"; truces there may be, but constantly renewed outbreaks there must be. Why? *We have annexed a new race problem.* Where there is no mutual willingness for legal blood mixture there is no fraternity, and where there is no fraternity there can be no true equality, and where there is none of these Government must, in form, or in spirit, or in both, be a Government by actual or by reserved force. Men differ about the right of the white man to maintain by forcible methods, if necessary, his own peculiar civilization and race supremacy in his own country. Surely, wise and good men cannot differ about the Unrighteousness of it in the brown man's country, which we can leave not only without sacrifice, but with all sorts of profit to ourselves.

The *Remedy:* Repeat the glorious page in our country's history which recites "Our Conduct to Cuba." We have given the Cubans peace and Self-development. Let us acknowledge the Right of the Filipino not to be Race-Ruled by us in his own country.

Fifth, Hemispheric Peace.

The *Fact:* The Spanish Americans certainly distrust and hate and probably fear us, as never before in our histories.

The *Cause:* Partially because we have shown in our dealings with the Filipinos a spirit of conquest, if not "criminal aggression," at once inconsistent with what Spanish Americans deemed our "Moral Code," our traditions, our national aspiration and our Federal Constitution; but

still more because we have, by Presidential utterances, changed the old kindly sympathetic Monroe Doctrine of protection from European overlordship into the new Roosevelt doctrine of our own overlordship; threatening interference wherever we choose to judge that "they do not pay" what we deem their "just obligations," or do not "behave" with what we may deem "political or industrial decency." What a safe judge of industrial decency, by the way, is a country tariff-corrupted and Trust-beridden!

The *Remedy:* Let a new President write a new letter at another Anniversary of Cuban Independence, more in the spirit of the occasion and, yet, more in the spirit of our own history.

Sixth, Industrial Peace.

The *Fact:* Combined labor on one side and combined capital on the other hate and distrust and war with one another to an extent unprecedented and not for long to be tolerated by the "average citizens," who are, by the way, twice as numerous as both put together and who seem to have no rights that anybody need respect.

The *Cause:* The present spirit of combined labor has grown out of a sense of injustice borne and anticipated. What fair-minded man denies that the belief is partially justified? Capitalistic interests, sheltered in their acts of greed, by exorbitant tariff schedules, enabling them to extort unjust profits from the consumer without fear of foreign competition, while, unhindered by a just and efficacious administration of the law, they enter into unlawful combinations and Trusts with one another, so as to prevent domestic competition, do, or are enabled to do, at the same time, another thing, in the long run, still more dangerous. Corporations, law-created, by combinations regardless of law with other corporations — likewise law-created — increase the power, now almost irresistible, of capital to dictate terms to the wage earner; in hard times to be the judge of how much his wages shall be reduced; in prosperous times to be the judge of what share of the profits of prosperity he shall receive.

With trusts in control and daily becoming more influential, beating to the ground all competition, laboring men in certain industries are finding that throughout whole States—yes, whole sections—*there are no competing employers* striving to outbid one another to secure laborers. There may be more than one job—there is but one master, however—one concern to hire to. Thus trusts increase the wage earner's cost of living, and when he would seek a higher nominal weekly wage, so that his true or net wage may, at least, not be lessened, they render his efforts to that end fruitless—as fruitless as the breaking of mad Mediterranean waves at the base of Gibraltar.

Result: The laborer, half understanding, but wholly feeling his impotency under industrial injustice, loses confidence in the laws and institutions of his country and becomes more embittered; class hate grows daily, taking the place of industrial peace and good-will.

Remedy: Put in power a party which can be relied upon to remove so much of the tariff shelter as enables trusts to enhance the cost of living of the wage earner, and all other consumers, above what they charge foreign consumers, and which can also be trusted to execute against Trusts and unlawful combinations (*with whom it neither has nor can have party affiliations*) all existing laws and such new ones as it may find wise, necessary and right to enact.

We can, at least, remove so much of hardship and consequent sense of injustice as proceeds from man's laws.

Another Reason to Vote the Democratic Ticket: Americans love courage and aspire to progress. The Democratic party has never made a slogan of "doing things," because neither doing nor undoing things is of itself right or wrong. It is right to do right things. It is right to refuse to do wrong things, aye, to undo them if already done. But it just so happens, in this year of our Lord's Grace, that it is the Democratic party which wants "to do things," and the Republican party which wants to obstruct their doing. The Democrats want to emerge from the gloom of commercial exclusiveness and the old-world barbarity of "National Prestige" by threat of force into a better and broader light; while the Republican party points with self-complacency to present abuses and old barbarities, half concealed in the

gloom, and exclaims: "It is well enough; we did it; it is finished; let us stand still." Is the picture overdrawn?

Ask themselves. Let us take a Republican deposition:

First Interrogatory: What will you do about the Tariff? Republican Answer: Stand pat.

Second Interrogatory: What about Canadian Reciprocity? Republican Answer: Stand pat.

Third Interrogatory: What about reciprocal trade relations generally? Republican Answer: Stand pat.

Fourth Interrogatory: How will you forestall combinations in Great Britain and preferential tariffs operating against us in Canada and France and elsewhere? Republican Answer: Stand pat.

Fifth Interrogatory: What about the Trusts? Republican Answer: Brag about the Northern Securities case; pass the word, "Do not run amuck," and "stand pat" again!

And so, *ad infinitum,* this campaign deposition of the Republican petitioners for popular support might be extended. Where they do not stand still, as they do in all domestic and so-called colonial policies, they want to go backward toward the barbarity of international bullyism and of unreasoning force, as they do in their American-Hemispheric-Overlordship utterances yet unrevoked, and in their general policy of heaping burdens of taxation upon the backs of the plain people for war-preparation and colonialistic purposes, to the crippling of home growth.

Another Reason, by way of illustration: The Democratic candidate wrote a letter not long since to a friend, in which he used this language: "Now, my dear ———, I do not know it all. I wish I did. One thing, at least; I have learned how to weigh evidence."

"Comparisons are odious." *Verb. sap.*

Nota Bene: I have taken for granted that the "Man" I am supposed to address is not actuated by a desire merely to hold an office, gotten by unwavering partisan service, or at the price of having deserted the Democratic party, nor by a desire merely to get an office. That sort of Man-Similitude will, of course, ask himself and others only one question: "Who is going to win?" and will probably conclude that "possession is nine points in the law" of political opinion-holding. What he needs is a prophet.

The Social Incarnation

BY GEORGE HOWARD GIBSON

Mother of Jesus, thou wert still a woman,
A common mother of a common man;
And they exalt thee who declare thee human,
A normal mother in great Nature's plan.

A common man is the divinest being
That God begets and mother-love conceives;
A common woman, so with God agreeing,
Can give him sons to-day, if she believes.

Brood lovingly and labor, blessed mothers,
In hope of other sons of God-like kind;
Jesus the elder must have many brothers
Before the incarnate glory is defined.

Think not of God revealed in one, most human,
And since withdrawn; in natural life he lives,
In every babe of every loving woman
Who reaches after good and, God-like, gives.

Despised was Jesus—numbered with the masses
Of landless workers, robbed of rights in earth;
A carpenter—he led against the classes
The mighty union seen before his birth.

Out of the pit of poverty sang Mary
The world's Magnificat of love and power;
For all the oppressed, whose heart and flesh are weary,
She saw a time when tyrannies must cower.

Tho tarrying long, the kingdom comes,—believe it;
By unexpected means, by workers' worth,
By common men united to retrieve it,
The meek shall soon hold title to the earth.

Stronger and stronger grow the federations
Of those who toil, whose labor still is priced;
Nearer and nearer comes the dream of nations
Ruled by the people's voice—the people's Christ.

Chicago, Ill.

War Embers in the Near East

BY BORIS SARAFOFF

[Boris Sarafoff is a member of the Revolutionary Committee of Macedonia, an organization with which Abdul Hamid, with all his forces from Asia, is powerless to cope. The Turk can play the great Powers of Europe one against another and deceive them forever with endless promises, but the little band of desperate men—who will not parley, who ask no quarter and give none, who war with dynamite against European as well as Turk—threaten to send the Mohamedan invaders back to the land from whence they came. Sarafoff is the most noted of the "committajis" (committee-men, as they are called by the Turks), for his methods of fighting the Turks and Europe have been the most violent. He was president of the committee formed in Bulgaria to assist the Bulgarians of Macedonia to attain their freedom when Miss Stone was captured by an insurgent band and held for ransom for the purpose of augmenting the funds of the late revolution.—EDITOR.]

THE uprising of Christians in Macedonia last year was suppressed by the Turks with a severity sufficient to make even those long-suffering and oft-deceived people put some hope in the new promises of the Powers of Europe. But their hope was of short duration and they find themselves today faced with the alternatives of submitting to the same barbarous treatment which was meted out to them before the revolution or renewing the struggle.

The reform scheme of the Powers, which was the outcome of the massacres the uprising brought about, promised to make Christian lives safe and bearable. In detail, the Powers planned to institute law courts, which would punish the Mohamedan who slew the Christian wantonly, took his property without just recompense, stole his child for use in slavery or dishonored his wife or daughter, all of which are now practiced without interference on the part of the authorities. The Powers planned to reorganize the methods of tax collecting, whereby a man who has purchased from the Government (often at a price far beyond what he could legally collect) the right to gather the tithe, stalks through the country with an armed escort and extorts from the peasants anywhere from ten to sixty per cent. of their crops. The only way to oppose this extortion is at arms, for the word of a hundred Christians does not stand in the law courts of Turkey against that of one Mohamedan. But for a Christian to possess a weapon is warrant for anything, from a brutal beating to slaughter on the spot, according to the mood of the Turks who discover the fact.

Boris Sarafoff, in the Uniform of a Bulgarian Officer

The reform scheme was comprehensive in its promises. It promised to reorganize the gendarmery, now composed of brigands, murderers, highway robbers, every man of them, and a large proportion of the officers illiterate. Christians were to be appointed to the service in proportion to their numbers in each district—which would be the great majority. The reform scheme went back and promised to

exact funds from the Turkish Government for rebuilding the towns and villages destroyed by the Turkish soldiers last year.

To effect all these changes two Civil Agents, a Russian and an Austrian were assigned to "assist" Hilmi Pasha, the Turkish Governor of the Rumelian provinces, under whom the massacres of last year were committed, and twenty-five* foreign officers, five from each, Austria, Russia, England, France and Italy, were appointed to "reorganize" the gendarmery. The presence of the foreign officers throughout the country was the thing upon which the Powers based their best hopes and that to which the Turks took most objection. The Turks have a great dread—and well founded—of Europeans witnessing their methods. When the new scheme was laid before him, supported by all the great European Powers except Germany, the Sultan, seeing he would be forced, eventually, to accept it in some form, tried to eliminate the gendarmery section, and caused the then existing gendarmery to be "reformed" at once. All the "Christian" spies and guides who had served the Turkish army in its late work of slaughter and devastation were enlisted, and Abdul Hamid supplied funds to pay up all back wages. But these reforms did not satisfy the Powers, and they insisted upon their plan being accepted "in effect." So it was up to the Turks to defeat the foreigners in the field.

The Civil Agents and the officers went to Macedonia. The Civil Agents took up their residence at Salonica with Hilmi Pasha, and the contingents of foreign officers selected sections of the country in which to work and repaired thither.

Salonica is the largest town in Macedonia, a seaport which foreigners are constantly visiting. It is kept, therefore, comparatively free of atrocities. Only once have the Civil Agents penetrated the interior to investigate the condition of affairs there. The Turks insist that they are not to go into the country except in company with the Governor-General (who only moves to Uskub or Monastir, the capitals of the other two villayets of Macedonia) and that their emissaries shall travel and make inquiries only with a Turkish official (who notes names and, after the foreigners depart, causes examples to be made of any Christians who dare to bear ill evidence against the Government).

The gendarmery officers are not to receive complaints from the peasants. Their duty is to "reorganize" the gendarmery. They have not command of the gendarmes and are permitted simply to "instruct" and "suggest." (This arrangement was agreed to on the plea of the Turkish Government that the Mohamedan dignity should be considered; to be commanded by a Christian is degradation to a Turk.) In consequence any suggestion of the officers which affects the condition of the people is not acted upon, and the progress which they (the officers) are making, if any, is on military lines solely. Abdul Hamid is not unwilling to have his army (of which the gendarmery is a part) drilled and organized by European officers. Every advance the gendarmery makes in proficiency makes it more effective against peasants who dare to rise, while provocation for rising is being mitigated in no way.

The first work in reforming the gendarmery is to weed out the criminals, who corrupt the whole service. The Austrian officers at Uskub recently attempted to remove a certain gendarme, of whose complicity in some crime they had received positive evidence. Count Salis, the commanding officer, called on the Turkish commander, and demanded the removal of the objectionable gendarme. The Turkish official, with the usual Turkish politeness, wrote out the man's discharge without a question, in the Austrian's presence. Some days later the Austrians discovered that the man was still in the service, and the Count called on the commander again and protested. He received assurances that the neglect to fulfil his "suggestion" was an error and that the discharge would be put into execution at once. But a week later the Austrians had again to protest. Again they received an apology and a promise. This fiasco was kept up until Count Salis despaired and the criminal in question is a gendarme to-day, saluting the Austrian officers whenever they pass him.

The Italians in the Monastir district,

* At the time of this writing Austria and Russia are making an effort to increase the number.

the most important section of all, have been hopelessly defeated. They have abandoned all efforts at doing anything, which has caused the suggestion to be made in the European press that perhaps their Government has reached a secret agreement with the Sultan, such as exists between Russia and Abdul Hamid. The French and the Russians have accomplished nothing, but the English report having had several unjustly imprisoned Christians freed and causing two corrupt officials to be removed. The Turks often display their leniency by releasing a prisoner on the request of a foreign official of some standing; the man set free generally suffers a double sentence at a later date. They also remove officials under firm demand and reward them with better posts in other districts.

The English are naturally the most successful of the foreign contingents: The Turks know that England has no designs upon their land, they feel a gratitude to England for lending them her might and influence on so many occasions, and the English officers are off in an unaffected district peopled by Turks, who do not complain against the Government because "it is Allah's will" that it should be what it is, and Greeks, who still cling to the hope of reviving a great Greek empire.

But if the gendarmery throughout all Macedonia could be reorganized of what value would it be? Suppose the gendarme could be taught to arrest the bandit and not his victim, the Turkish tribunal before whom the robber appeared would set him free for a share of the booty. The Turkish tribunal receives no pay. The Austrian and Russian Civil Agents are endeavoring to obtain an appropriation in order to pay regular salaries to the tribunals and obviate the necessity of their selling judgments. The Sultan is displaying his accustomed obstinacy to paying his officers. Perhaps he reasons that regular salaries would not alter the condition of his courts.

It is not unfair to say that the peasants of Macedonia pay in legal and illegal taxation quite forty per cent. of the results of their annual labors, quite ample to make every official rich enough to be honest. The country is as rich as it is magnificent, and even at the enormous legal taxation the peasants would be well off were they permitted to raise and sell all the land would yield. But it is useless for them to produce much more than their own requirements, for trade is confined to the district markets and prowling soldiers fill their bags from hampers which dare to be fuller and better than their neighbors.

Quite half of the tax money gathered never gets to the Ottoman treasury. The other half goes into the public coffers, but is again divided by the officials who expend it, a proportion going into their own pockets and the remainder to the purchase of arms and ammunition. The Turk's sole idea of government is suppression. For the tremendous taxation he pays the Macedonia peasant gets no roads for his teams, no schools for his children, no courts of justice, no protection for his life or the honor of his womenfolk; every farthing he pays goes into the private pockets of his oppressors or into guns and swords to keep him paying.

The abuse in the method of tax collecting is on the Civil Agents' program for adjustment. Recently these gentlemen have made the announcement that the Turkish Government has agreed to try a new system, whereby the tithe gatherer cannot collect more than the legal percentage of the harvest, in twenty villages in the Monastir district next year. A trial—in twenty villages—one year hence! When will an equitable system be in operation in 3,000 villages?

The Christian peasants of Macedonia are suffering from the same injustices, robberies, persecutions, murders, dishonors of their womenfolk and all the list of Turkish crimes under the very eyes of the foreign officers as they suffered before the revolution. The Turks have succeeded in defeating the reformers at every point and the foreign officials have accomplished in a year not one permanent adjustment of a chronic abuse. Not a village of the hundred odd which were destroyed last year has been rebuilt, and thirty thousand people are living in brush hovels amid the ruins with barely enough to eat to keep body and soul together.

The Revolutionary Committee and the enlightened men of the country realized how ineffective the reform scheme was upon its promulgation, and abandoned all hope for any effective change in the lot of the unhappy people when Austria and Russia, the two Powers most interested to acquire seacoast on the Mediterranean, set aside the proposal of Great Britain to appoint a Christian Governor over the province and commissioned, instead, the Austrian and Russian Civil Agents to "assist" Hilmi Pasha, Abdul Hamid's "instrument of butchery." The Macedonians have no desire to exchange the rule of King Log for that of King Stork. We do not intend to sit still under the present condition of affairs, with our wounds covered until "the two most interested Powers" are prepared to display them to Europe, shock the civilized world and enter to "adjust" the disgraceful condition of Southeastern Europe.

We are going to fight on in Macedonia. We saved about two-thirds of the number of guns we had in the revolution last year, and we have still much unused dynamite. Of cartridges and ready money we had not sufficient to renew the struggle effectively this year. But we have maintained a skeleton of the revolutionary organization, by means of which the spirit of the people is kept kindled for another rising at an opportune moment. We have seventy bands numbering from ten to twenty men each in the mountains at present. These are doing no fighting against the Turkish troops except when discovered and attacked. When a massacre and plunder or other gross outrage occurs, such as the recent affair at Gomenji, the Turks are made to pay a penalty, if not in blood in money, for destruction of railway or other property by dynamite. Such retaliation is not inflicted solely in a spirit of revenge; it is meant to keep the Turkish Government in respect of the Internal Revolutionary organization.

The Turkish Government has recently commissioned private bands of Albanian and Turkish brigands to hunt down our bands, the Turkish army being unequal to the task, but these "Bashi-bazouks" find it far more profitable to ply the trade of brigands. Seven of the Mohamedan bands came in contact with the insurgent bands and the result in each case was the total annihilation of the former. So they have now turned their attention to extorting ransoms by threats of murder, of burning property and by kidnapping; and most unfortunate for the insurgent cause is that their letters are written in Bulgarian, purporting to be from the Internal Committee. This is doubtless one of Hilmi Pasha's clever schemes. A significant incident took place a few months ago at Salonica. One of the Civil Agents called on Hilmi Pasha and requested that some action be taken to recover two children who had been carried off by these brigands and held for ransom. The Governor-General replied that he thought it best to take no action, for sending troops after the brigands would disturb the peaceful state of the country. The Civil Agent insisted that some effort should be made and Hilmi Pasha replied that the Turkish Government would prefer to pay the ransom. But, of course, the ransom was not paid, and I fear to say what became of the captives, for they were both Bulgarians.

There are but two ways to make life bearable in the Christian lands dominated by the Turk. One is to reform Constantinople—a hopeless task; the other is to amputate the Christian provinces. You cannot cure a limb on a diseased trunk. That nothing can be changed as long as the Turk rules has been proven times innumerable, but the European Powers, fearful and jealous of one another, take turns in befriending him, defending him at the times when his exit from Europe will not favor them. As for sympathy for the Christians who have suffered untold tortures for 500 years because they refuse to abjure their faith and follow Mohamed, there is none in the world. Eighty thousand Armenians were massacred at Abdul Mamid's order, while Russia, ever professing sympathy with suffering Christians, and England, which had pledged herself to protect them, held their guns at each other. Material interests will affect Europe, and only material interests. European trade in European Turkey must be destroyed and Turkey-in-Europe must be kept a menace to the peace of Europe.

One of the reasons advanced why Macedonia should not be granted autonomy is its variety of conflicting races. It is said that autonomy would be no solution of the Balkan question. The Macedonian peasants are simple folk who want only to be allowed to live in liberty, and when assurances for life, honor and property are given them political agitators and propagandists can exist no longer in their land. The present enmity between Greek, Serb, Bulgar and Vlach is an entirely false one, infused into their spirits by the propagandists of the respective Balkan states, encouraged by Powers interested in maintaining a balance of weakness among them and fostered by the Turks that they may rule by their subjects' disunion. Under an autonomy the propaganda would end. Macedonia would have its own schools and churches, and Greek, Vlach, Bulgar and Serb would become Macedonians, and Turk and Albanian would be eligible to the same title if they should choose to come under it. There are Turks in Servia, Rumania and Bulgaria. They are better off in Servia than they are in their own land; the gendarmery and other offices are open to them in Rumania, and in Bulgaria seven of them sit in the Sombranje as representatives of the Mohamedan districts. The longer Macedonia remains a part of Turkey the closer Austria and Russia weave their web about the Balkans. As long as Macedonia remains under the Turk anarchy shall prevail.

Anarchy or autonomy!

The New Navy

BY CHARLES E. JEFFERSON, D.D.

[The questions raised in the latter part of Secretary Morton's article, published elsewhere this week, would seem to make the following article on the other side, by the pastor of the Broadway Tabernacle of New York City, of especial interest.—EDITOR.]

TO many it is a cause for boundless rejoicing, the joy of the nation and the pride of the New World, but some of us cannot help asking whereunto this thing is going to grow. We have increased our naval expenditures seven hundred per cent. within eighteen years, and the tree is yet green. Our navy as planned already outranks that of all countries except England and France, and the end is not yet. The experts are all agreed that we must push ahead of France, and bolder spirits claim that we must surpass England. To stand second to England will demand an annual naval expenditure of $200,000,000. Our naval expenditures thus far are not half that sum, but already Congress is obliged to cut down its appropriations for rivers and harbors and for public improvements, and must haggle sometimes for years over the price of a piece of land to put a public building on. We cannot eat our cake and keep it too, nor can we spend $200,000,000 a year on a navy and have it left for something else.

Then one wonders sometimes just what we want such an enormous navy for. Of course, the steel kings want it, and so do the manufacturers of armor and projectiles and ships. There is probably a slight profit in battle ships at $8,000,000 apiece. A hundred millions a year is a plum of fair dimensions, and that the sight of it should quicken patriotism is not surprising. Then the naval experts want it, for they have a laudable professional pride in pushing our navy to the head of the procession. Editors of a certain sort want it, for it lends itself easily to graphic treatment and money-making headlines. And the great crowds of barbarians in

all of our cities want it, just as they want many another thing which it is not good for them to have. But why sensible, patriotic Americans who understand the genius of their country and who have read history even a little, and who want our Republic to escape the entanglements and delusions which have wrought havoc with the greatest empires of the past—why they should want to surrender the policy which we followed for a hunderd years with success, and adopt the policy of governments which are being slowly crushed by the weight of their armaments, this is, indeed, a puzzle.

One cannot help wondering how it comes that Americans with all their education are so easily gulled. For instance: when men say that a great navy is just as essential to a nation as a police force is to a city, one wonders that anybody can be so dull witted as not to see the fallacy. There are not many of us who go with Tolstoy in saying that all use of force is wrong and forbidden, for crazy men and drunken men and thugs must sometimes be coerced into action which they would not of themselves have preferred. And as bandits can carry on their depredations on water as well as on land, every nation should do its part in policing the highways of the sea. But every sane man knows that we are not just now building up a naval police force. We are building up a fighting navy, a navy not for capturing pirates, but for fighting the biggest navy afloat. We are not thinking of pirates, but of Russia, of Germany, of England and of France, our neighbors in the family of Christian nations!

One wonders also at the Quaker-like language of these naval enthusiasts. "A large navy is the most potent means of securing peace," says one. "It is essential to the maintenance of peace," says another. "Preparedness for war is the best possible guarantee of peace," says a third. This is the gospel being preached by our President, by many Senators and Congressmen, and by a host of eloquent talkers, who succeed in deceiving even the elect. But why be hoodwinked by a falsehood so transparent? All history proves that the way to preserve the peace is to prepare for peace. This was the doctrine of our fathers, and they refused, therefore, to fortify the Canadian frontier or to fill the lakes with men of war. Their policy has worked well. It is the custom of every Government to compel its citizens to go unarmed. The men in Sicily and Kentucky who prepare to fight always fight. It is only when men cease to carry dangerous weapons that they are able to preserve the peace. Napoleon III would not reduce his army—he prepared for war. Bismarck also prepared for war, and war came. Japan prepared for war, so did China—they fought. Russia has been adding to her battle ships, so has Japan—they are using them. A nation cannot fill its belt with bowie knives and revolvers without wanting to see what they will do. When we get our navy up to the desired size we will use it. Some one will insult us, step on our toes in some of the markets of the world, the barbaric press will shriek, the blood will boil, and there will be war!

Before we had a navy we never knew the sense of fear. We walked unarmed among the nations of the earth, and people of all lands were our friends. Now that we have our battleships we are in a state of chronic alarm. We are suspected, feared, and in many quarters hated. We listen breathlessly to hear what far-off critics are saying about us. We read each day in magazine or paper of some new and fearful peril. We know not what a day may bring forth. We have whetted our sword in the ears of the nations, and have said to our neighbors, "If you want a scrap, come on!"

And this is the nation from which the world had expected better things, the Republic which influenced and led the nations without a navy for a hundred years, which defended the Monroe Doctrine against France and against the British Empire, not by might nor by power, but by the potent spirit of a great people who dared to do justly and to love mercy.

To some of us it is inexpressibly sad the change which has come over the spirit of many of our people. Wealth has spoiled us, success has coarsened us, power has intoxicated us. We are becoming cheap and common, aping the customs of nations far below us. Losing our faith in moral forces, we are being swayed more and more by the ideals

which brought Rome to ruin, and which we once counted it our greatest joy to have escaped. To us as a nation was granted the inestimable privilege of doing a beautiful and original thing, of walking among the nations as their helper and friend, trusting them and being trusted by them in return, never suggesting by bristling guns and deadly projectiles that we were their enemy or that they were ours. God gave us a continent washed by two broad oceans that here unmolested we might work out in peace the problems of liberty and love. Europe is a mass of prejudices, enmities and age-long hatreds. Nothing original can be attempted there. Men must watch one another sword in hand. But to us was given a home far away from the rivalries that embittered and the hatreds which destroyed, in order that we might succeed where all who went before us had failed. But, alas! the seductions of Egypt are too mighty for us, the brute in us is too strong. Our ideals have for many eyes grown dim. Instead of spending our money on great public improvements which would make America the wonder of the world, or upon the black race, which might be made one of the great races of history, we are squandering hundreds of millions on instruments of slaughter, thereby educating a new generation of American boys to barbaric ideals of life, and bringing down the moral tone of the world.

And the pity of it is that all this is done in christendom, and under the direction and with the sanction of the men who pray "Our Father," and who claim to find heaven's will expressed in the Sermon on the Mount. The Czar of Russia, the Emperor of Germany, the President of France, the King of England and the President of the United Sttaes are all of them professedly Christian men, surrounded by counselors who claim also to be Christians, and yet they allow the intolerable outrage of this armed peace to go on. The first thing we give to Pagan peoples is perfected methods in the art of human slaughter. Japan uses our guns before she learns our prayers. Small wonder is it that the philosophers of India ask in perplexity: "Is Christianity indeed the religion that is to come, or are we to look for another?" But some one says that America cannot disarm until all other nations do. Our reply is: Can she not make a beginning? Can she not lead the way?

New York City.

Home Bound

BY FRANK WALCOTT HUTT

A memory of domes and spires,
And long, white levels flowing by,
The slow, gray smoke of Christmas fires
White wonder of the winter sky;
Swift glimpses of beleaguered woods,
Black roofs a-willow in the snow,
Farm brooks a-slumbering in their hoods,
And little towns that come and go—
Until, at twilight edge, the ride
Of unfamiliar things ebbs past,
And those to me most dear abide
And hold me by their moorings fast.
Hail, little paths, all swept and clear!
Hail, cozy roofiree at the end!
This is my Land of Never Fear;
Yonder for me there waits a friend.

Asbury Grove, Mass.

More Thoughts On Life

BY COUNT LEO TOLSTOY

[The following article is from a letter by Tolstoy written to a friend who had asked his aid in solving the deeper problems of living and thinking.—EDITOR.]

I WAS very glad to hear from you, but felt very sorry when I learned of your useless, senseless mode of life, as you put it, and of your illness.

The first, a life with which he that leads it is not satisfied, is worst of all. We are not responsible for sickness, and, therefore, the wise man and he that believes in God can bear it calmly. But we must not waste our life at random, and wherever we are, under all circumstances, we can do that for which life was given unto us,—that is, to perfect ourselves, draw nearer to God ("Be perfect even as your Father in Heaven"), to try to be judicious and lovable in everything. And if we do not do this, it is very sad.

It is not only possible to perfect ourselves and to draw nearer to God at all times and everywhere, but it is not even difficult to do it. Some think that to accomplish this it is necessary to undertake something, to arrange something. This is not true, it is but necessary to abstain from doing that which you consider to be wrong; and life will shape itself one way or the other; and if you will but abstain from doing that which you consider wrong, then you will surely do good, because a healthy man cannot remain idle.

I advise you to do the same, my dear friend: restrain yourself, do not quarrel, do not try to make a display of yourself, do not contrive anything new; do not let the water fall anywhere save on the wheel, and the wheel will work for your good and for the good of mankind. God is love and man is love. And if man will but refuse to give himself to temptations and to deceits which force him to waste his life for nothing, love will appear and will perform in him the work of God.

It is always very painful to me to think that there are people, like yourself, suffering from lack of knowledge, from doubt and error, while the truth is so clear and simple and known to me, not only theoretically, but also practically,—that is, I have for a long time lived by this truth, and after the most terrible doubts and just such despair as you are experiencing, I live by this truth calmly and joyously.

Life is the deliverance of the soul—the spiritual, self-existing essence from the conditions of the bodily personality into which it is placed.

God is that spiritual, self-existing being by whose will our soul is confined within our bodily personality.

There are two ways of delivering the soul: one, by means of simultaneous or gradual suicide,—that is, by deviating from performing the will of God; or, the second way, by means of performing in life the work for which our soul was confined by God in our personality.

The first deliverance is but a seeming deliverance, because the soul, coming from God, and being all in his power, cannot cease to be what it must be according to God's will, and no matter how much it would resist, it will be compelled to do as God demands of it; only it will do it with resistance and suffering. The second, the true deliverance, consists of an ever greater and greater performance of God's will, and of the ever closer and closer approach and similarity to him.

The deliverance of the soul according to God's will, producing the whole work of life, is attained but through love and through the exaltation of love.

Love means the destruction of the obstacles which separate our personality from other personalities. The more we love mankind and other beings, the broader grows our own personality. Love toward all, to the source of life, to God, destroys all obstacles of personality and unites us with God.

Human life lies in the yearning after this ideal and in the approach toward it. There is no other life. And this approach is possible infinitely, and in this approach there is bliss.

YASNAYA POLIANA, RUSSIA.

Literature

An Interpreter of the East

In the publisher's Introduction to "Kwaidan" (Mr. Hearn's penultimate book) allusion was made to an essay in the *Atlantic Monthly* which had attributed the peculiar fascination of that writer's work to the blending therein of three different, almost antagonistic, visions of life—the original esthetic temperament of the Japanese themselves, upon which time had engrafted the religious faith of India, and these two interpreted in the terms of Herbert Spencer's scientific philosophy. It may not be amiss to say that this theory of his genius received rather striking confirmation in a letter from Mr. Hearn's own hand, and that it serves as a key to this latest book,* the final proofs of which he passed by cablegram on the very day before his death.

That mystic blending, one may say, of esthetics and religion and Western science lay more or less concealed in Mr. Hearn's earlier books, which contained for the most part slight stories translated from the Japanese and delicate studies of this and that phase of Japanese life. The present volume, however, is a more deliberate attempt to interpret the Shinto and Buddhistic faiths, using evolutional ideas as the medium best fitted to render the higher dogmas of the East palatable to Western ears, and showing how the whole history and character of the people can be understood in this way and not otherwise. In one respect this study is undoubtedly at fault, in another it succeeds admirably. Whether from ignorance of the later literature or through loyalty to one whom he calls master, Mr. Hearn seems not to recognize the fact that Spencer's exclusive derivation of religion from ghost and ancestor worship is by no means generally accepted, that it is, in truth, almost certainly too narrow to explain the full evolution of religious phenomena. His constant parallel, therefore, between Japanese ancestor worship, which he rightly makes the basis of the national character, and Spencer's Sociology may well cause some uneasiness among specialists in these subjects.

It should be quickly added, however, that this too exclusive devotion to Spencer in no way vitiates the real purpose of the book. Mr. Hearn's rapid summary of the development of Shinto and Buddhism in Japan is a masterly piece of writing in its kind. He knows how to seize the essential fact or the essential theory, and he masses these facts and theories into an exposition so clear and simple that every difficulty of comprehension falls away. The original Shinto or ancestor cult of the Japanese is studied as the religion first of the single family, then of the larger family or class, and, thirdly, of the whole people regarded as the family of the Emperor. From these three aspects of the faith he proceeds to explain the social habits, the temperament and the government of the nation. Thus, as some indication of his method, we may quote these few words on a peculiar paradox in Japanese morals:

"It is, therefore, easy to understand why Shinto never had a written code of morals, and why its greatest scholars have declared that a moral code is unnecessary. In that stage of religious evolution which ancestor-worship represents, there can be no distinction between religion and ethics, not between ethics and custom. Government and religion are the same; custom and law are identified. The ethics of Shinto were all included in conformity to custom. The traditional rules of the household, the traditional laws of the commune—these were the morals of Shinto; to obey them was religion; to disobey them, impiety."

Still subtler and more penetrating are the two chapters dealing with the religion of Buddha, which, passing from India through China, was grafted in strange manner on the national faith of Japan. There will be many readers who will find Mr. Hearn's attitude to Buddhism too sympathetic; indeed, this charge may well be brought against his whole study of the Orient. However that may be, his

* Japan, an Attempt at Interpretation. By *Lafcadio Hearn*. New York: The Macmillan Co. $1.00 net.

attitude of sympathy certainly results in one notable advantage: we feel in reading his books, especially in reading this last volume, that Shinto and Buddhism are not mere specialties of the scholar, but are real religions in which the emotional life of a great people is involved. To have accomplished so much is a rare and praiseworthy feat.

The Master's Violin

Some foolish modern people may wonder why Myrtle Reed's novels are so popular. It is because they appeal to what the "up to date" sort do not have—old fashioned memories and ideals. They are not original in substance, but original in that they remind us of so many lovely things which have passed away. *The Master's Violin** is just the kind of book a prudent mother would choose for her young daughter to read. If Miss Havergail could have written a novel, doubtless she would have produced something like it. The heroine is afraid of worms and sews neatly with her fingers. There is some kissing, to be sure, because by mistake a very slangy young man gets into the story, but this is done under such artificial circumstances as to produce the impression that the author herself never kissed a man in her life, and has therefore a singularly ingenuous idea of the performance. This extraordinary modesty is further demonstrated by a charming maiden lady of seventy-five in the story, who, upon being asked why she had never married, replied: "I may be wrong, but I have always felt that it was indelicate to allow one's self to care for a gentleman!" Nearly one-third of the book, by the way, is consumed in the account given of this same lady's illness, death and the sentimental after-effects upon her relatives. Before the author finishes, indeed, the reader feels that he has been wearing mourning himself for six months, and that it is really a privilege to die in one of Miss Reed's novels.

All this, so far from detracting, will add to the popularity of the book; because it will remind many people of the funerals we had when we buried lovely old saints instead of agnostical modern philanthropists, when we wept quite naturally over the bier and gazed passionately at the dear waxened face and the wrinkled lady hands clasped over a moss rose. In those days this was not considered vulgar, as it is now. And we may think that we have outgrown these emotions, but it is only the sophisticated few who have; the other kind, and the little old ladies far away in the country places who still sew elegantly with their fingers, are in the majority, especially at funerals. They like to weep over their dead and talk delicately of the diseases which took them off. And it is very well for them that they have a writer of Mytrle Reed's gentle gifts to represent their sentiments and emotions.

* The Master's Violin *By Myrtle Reed.* New York and London: G. P. Putnam's Sons. $1.50.

Samuel Chapman Armstrong

In collecting, selecting and arranging the material for her father's biography * Mrs. Talbot has shown unusual ability. The finished work is not a narrative of events, it is a psychological drama in which one witnesses, step by step, the development of a great spirit. General Armstrong's work for negroes and Indians, for the North and the South, for education in general and industrial education in particular, is too well known to need special description here. Hampton, Tuskegee and kindred institutions keep it constantly before the public. But the man himself, the vivid, earnest, intellectual, far-seeing, intensely manly personality, who gave his life without stint to the foundation and perpetuation of his work, is not so well known. Even to those who knew him in the daily intimacy of life at Hampton, who saw the strength, the patience, the never-failing sense of proportion between petty details and broad results, the wisdom and the enthusiasm of the man, his daughter's sketch brings a new revelation of his character and of the reasons why he was what he was.

At the beginning of it all is the

* Samuel Chapman Armstrong. *By Mrs. Edith A. Talbot.* New York: Doubleday, Page & Co. $1.50.

abounding, physical vigor, the intellectual force, the strong religious feeling and the life of trust and responsibility toward a weaker race that belonged to his boyhood in the missionary home in Hawaii. At the age of twenty-one, when he entered the junior class in Williams College, this is the impression that he made on his classmates:

"There was about him something of the high courage and jollity of the tar; he carried with him the vitalities of the ocean. Like all those South Sea Islanders, he had been brought up to the water; it had imparted to him a kind of mental as well as physical amphibiousness. It seemed natural to him to strike out in any element.' . . .

With Armstrong's graduation came the question of work. His choice of the army seems to have been more the result of his strenuous temperament than of the cause for which the North was fighting. He was still a Hawaiian rather than an American. The final outcome of the war as regards slavery had not then made itself clear. The military life, with its hardships, its excitements, its command of men, its dash and glitter, appealed to his primitive instincts. His first command was a company of his own recruiting in a Troy (N. Y.) regiment, and he went to the war as he would have gone into any other occupation, in earnest, to do his best, to understand his work, and to bear every responsibility with unflinching fidelity. But the emancipation of the slaves fired him with the zeal of a crusader, and, later, the command of a negro regiment aroused in him a confidence in the destiny of the freed race and a sympathy for their actual condition that became abiding forces in his life. Only at the end of the war, when after three years of service in the army, he suddenly came to the consciousness that he had thereby won citizenship in the Republic, did he begin to feel the glow of patriotism and that, after all, the country was not a mere convenient league of States, but an entity worth dying for or living for.

To a weaker character or a more brutal one than Armstrong's war may be demoralizing, but, saved by innate refinement and far-reaching sympathy from the dangers that frequently wreck lower natures, he was able to write to his mother:

"The service has been of the greatest advantage to me. It has been worth far more to me than many months of college life. I have not found it demoralizing. I have gained rather than lost spiritually since I entered the army."

At the close of the war came an appointment as agent of the Freedmen's Bureau, in charge of ten counties in Virginia, with headquarters at Hampton. A part of his duty was the superintendence of the schools for the freedmen that were springing up all over the region. By the time that the Freedmen's Bureau came to an end in 1872 General Armstrong had embarked upon the enterprise for which his whole previous life had been but a preparation. He had set aside all dreams of wealth and political preferment and had assumed for life, as he knew even then, the burden of a work which had between itself and failure only the absolute faith of one man in his ideals. When, in 1890, a man aged and broken before his time by the weight of the burden that he had carried for more than twenty years, General Armstrong was looking back over his life, he could say with perfect honesty, so complete had been his devotion to his ideals:

"Few men have had the chance that I have had. I never gave up or sacrificed anything in my life—have been, seemingly, guided in everything. It pays to follow one's best light—to put God and country first and ourselves afterward."

The insight which this book gives into a noble, manly and effective life cannot fail to be an inspiration to all who read it. Mrs. Talbot is to be congratulated on having brought out so clearly the wonderful personality of a man whose work was great, but whose character was even greater than his work.

Indian Life in Town and Country. By Herbert Compton. New York: G. P. Putnam's Son. $1.25.

This work contains a great deal of useful information, but also too many superficial generalities. India is certainly divided into many different religious bodies, but the differences in religion are not now so much of a barrier against their progress as the author thinks. The United States is doing well in spite of

the number of its religious sects. The chief impediment, that the majority of the Indians believe that self-effacement and not self-fulfilment is a truer and better aim, Mr. Compton does not point out. The difficulty of language was once a very great obstacle, but with the introduction of English education it is being done away with. Moreover, Hindustani has long since been the *lingua franca* of India. Intermarriage between the different peoples and religions is not "absolutely unknown," as the author says it is, for a number of cases can be cited against him. The Bengalese are marrying the Bombayites, and the Bombayites are marrying the Madrasees. Haste is not now "the very breath of his nostrils," nor "to preserve his caste is the be-all and end-all of a Hindu's career in this world." It is true that its social conventions prevail in the masses, but it has lost its ancient force. Even a Brahman of to-day secretly dines with a Sudra, and the best of it is this, that it is an open secret! The wrongs of womanhood are fast disappearing. The number of widow marriages has been greatly increased, and the infant and child marriage customs are disappearing. Contrary to his publishers' advertisement, Mr. Herbert Compton is strikingly unsympathetic all throughout his book, save on one occasion, with the speechless teeming millions of India. In matters of individual concern he is perhaps very "open-minded," but in treating with the questions of national importance he is blindly in favor of the Government of India. For example, Mr. Compton says:

> "Wild beasts and venomous reptiles enter into the economy of daily life with a shocking freedom. Of savage wild beasts, such as the tiger and wolf, I will not pause to write; they are too well known by repute. But many a peasant's life is rendered a burden to him by wild pig, deer, jackals and monkeys."

But in the face of this he has only praise for the Arms Act, which prevents the native from defending his life and property. Neither he has commented upon his truthful assertion that India is a country with "no political privileges, no representation and no members of Parliament." The moderate demand of the Indian National Congress for only half the appointments he calls "theoretical." He expresses much sympathy for the starving population of India, whose income is three half pence a day, but he is silent on one of its obvious causes, the refusal to give permanent ownership to the land.

The Benares Ghats. From "Indian Life." Putnam's

Machiavelli and the Modern State. By Louis Dyer. New York: Ginn & Co. $1.00.

Many writers have with more or less success discussed the character of Machiavelli and the aim and meaning of his works. Mr. Dyer's attempt to solve the enigma of the Florentine sphinx is partly an expansion of Lord Acton's dictum, which figures at the head of his study:

"The immediate purpose with which Italians and Germans effected the great change in the European Constitution was unity, not liberty. They constructed not liberties, but forces."

Machiavelli, therefore, ought to have such benefit of clergy as he merited for seeing that political being must come before liberty comes, and that morals may be thrown overboard if the task of rescuing the beginnings and fostering the growth of national life renders it necessary. The consolidation of a strong and united Italy was the realization of the engrossing ideal of Machiavelli, who first revealed to the modern Italian world the Roman spirit of political unity in his *Discourses on Livy*. Yet, although Mr. Dyer considers that the author of *The Prince* must be regarded as the founder of modern political science, he dwells at some length on a fact that has not been heretofore touched upon by other critics of Machiavelli—namely, the extent to which certain antiquated and incongruous principles, borrowed from medievalism, lurked behind his modern views. This subject is treated with great fullness and clearness in the second and third chapters. Mr. Dyer tells us that those who read *The Prince* will form an inadequate idea of its author. In his longer works he does not neglect such vital concerns as morals, liberty and religion, tho he had abundant reason for excluding them from *The Prince*. This seems to be a somewhat rash assertion, for the principles that are condensed in *The Prince*—worship of success, almost absolute indifference to good and evil, contempt of the human soul—are found in a less connected form in all his other writings. Mr. Dyer has made an interesting book, altho his answer to the question, "How did Machiavelli satisfy himself that the Prince was bound, for the redemption of Italy, to do things from which, as the father of a family and a private man, our author manifestly recoiled?" is not altogether satisfactory and convincing. Those who have glanced at the Mandragola and the letters to Vettori will hardly adopt Mr. Dyer's high estimate of Machiavelli's private morals. The work on the whole shows considerable grasp of the political history of the sixteenth century, and the style, if not particularly brilliant, is pleasing.

The Watchers of the Trails. By Charles G. D. Roberts. Boston: L. C. Page & Co. $2.00.

Professor Roberts has sixteen volumes to his credit, ranging from poetry and history to this, his last book, tales of wild beasts. The characters are taken from all parts of the animal kingdom, from fish to fowl, and their motives and actions are interpreted sympathetically, yet without that fictitious humanizing which makes so many nature books misleading and harmful. There is a sameness to all of the stories. They are all of the strenuous order and open in much the same manner. A bit of description, detailed but not particularly brilliant, then a sense of silence, a spring, a fight and a death. His heroes do not dwell in a certain place of which there is no counterpart, but their lairs may be anywhere, the Bronx would do as well as the Rockies. There is a splotch of color, or bolder, a turbulent stream, a still night, a lonely trail, or a dark forest glade, and all of these bits of description are marked and numbered, like scenery shifts in a theater, to be utilized when they are needed. In the story entitled, "The Silver Frost," where Professor Roberts has endeavored to portray a word picture that would stand in a class by itself, he has succeeded in giving the effect of a frosty Christmas card that one buys in stationery stores, rather than the scene itself. The best stories are: "The Freedom of the Black Faced Ram," and "The Rivals of Ringwook." The book is issued in beautiful garment, and the illustrations by Charles Livingston Bull are very fine examples of that illustrator's work. This, and the simple nature of the stories, ought to make a successful seller. It is a pleasant way of acquiring a large amount of information about animals, not the stuffed ones of the museum, but the real ones of the wilds.

The Penetration of Arabia. By David George Hogarth, M.A., F.R.G.S. [The Story of Exploration Series.] New York: Frederick A. Stokes Co. $1.35.

This second volume of The Story of Exploration is a very able book. Arabia may almost be called a unique country. Lying in the very heart of the Old World, bounded on the east, north and west by centers of ancient and historically famous civilizations, we actually know less about it than about any other similar area on the face of the earth. It is true that Mr. Hogarth is not himself an explorer, but that is no disadvantage. What was needed was a careful digest of the work of the few travelers who, impelled by curiosity mainly, have attempted to penetrate the mystery which a jealous Mohammedanism has thrown over the land. The author has prepared such a digest, and we certainly have a very interesting work; but the reader will be astonished at the lack of trustworthy information about a land referred to in history from remote times and lying alongside a great highway of the nations.

Through Science to Faith. By Newman Smyth. New York: Charles Scribner's Sons. $1.50.

This new edition is welcome, for the book is one of the best of those recently written on the relation of modern science to the theology of the future. It is without dogmatism and devoid of all uncharitableness. Such work is at the present time necessarily tentative, but it shows that a post-Darwinian teleology is not only possible, but that in its wideness and religious value the new teleology outshames the old. In this new edition more attention should have been paid to recent work on evolution, such as that of De Vries, for the author's argument of phosphoric evolution receives much better support from the mutation theory than from the dogma of Darwin *Natura non facit saltum.*

Literary Notes

A PERIODICAL devoted to spelling reform, which has the courage of its convictions, is "The Herald," of Toronto, Canada. It contains many interesting notes on current pronunciation.

....For those who have fallen into the reprehensible and delightful habit of reading in bed, we recommend especially Crowell's Pocket Edition of Classics, for they are light to hold and the print is clear. At 35 cents apiece, or 75 in limp leather, one can afford to have one in the pockets of each suit of clothes. Recent issues are Robert Bell's Songs from the Dramatists, Addison's Essays, Lord Chesterfield's Letters, Gowan's Hundred Best English Poems and Sheridan's Rivals and School for Scandal.

....The volume on Bookplates, by Edward Almack, included in their series of Little Books on Art, by Methuen & Co., of London (imported by Scribner's), leaves much to be desired. The author's style is not always clear, and very little if anything new has been said by him about bookplates. In his chapter on bookplates in America much irrelevant matter has been introduced. The bibliography is exceedingly poor and includes nothing published since 1899.

Pebbles

ASKED why he went to Europe every year, an American author replied: "To get a reputation in America!"—*Atlanta Constitution.*

....AWKWARD MISTAKE.—*Mr. Gusch* (looking at family portraits): "Ah, what a strong face your grandpa had. Was he a soldier?" *Miss Thrush:* "Sir! Soldier? That isn't grandpa! That's grandma?"—*Chicago News.*

...."George," queried Ethel, "you have just bought the Standard Dictionary; how do you pronounce this word—'Kismet?'" "In the Arabic, my dear, this great authority says the 't' is silent." "Kis-me?" asked Ethel. "With pleasure!" replied George, feeling repaid already for his purchase."—*Experiment Station Record.*

....THE LOT OF A WYOMING EDITOR.—Editing a newspaper is a nice thing. If we publish jokes, people say we are rattle-brained. If we don't, we are fossils. If we publish original matter, they say we don't give them enough selections. If we give them selections, they say we are too lazy to write. If we don't go to church, we are heathens. If we do go, we are hypocrites. If we remain at the office, we ought to be out looking for news items. If we go out, then we are not attending to business. If we wear old clothes, they laugh at us. If we wear good clothes, they say we have a pull. Now, what are we to do? Just as likely as not some one will say that we stole this from an exchange. So we did. It's from the *Wyoming Derrick.—Dillon (Wyo.) Doublejack.*

Editorials

Nature as Artist

A PREMATURE man, having nicotined himself, dropped the stub of his cigar in a beautiful grove of spruce. It fell on a mouse nest of dry grass and stubble. This kindled and a delicate flame crept up a dead raspberry brush. It touched the resinous branches and in a few hours the work of a hundred years was a field of blackened stumps. Let me see what can be done about it, said the Virginia Creeper. All summer it ran fine threads of vine up the charred steeples. Few noticed them, but when October came there was a second flame in that grove—a scarlet glory that exceeded the brilliant colors of all the groves of that region. Slowly the Virginia creepers are devouring the carbon and turning it into new forms of life. Every autumn those who used to love the hemlock grove go to look at the grove of ampelopsis. You have only to hold us up, said the vines, and we will glorify you.

A lazy farmer took all he could get from his land, and gave nothing back. We are growing poorer, said his fields; but the farmer was himself also growing poorer. At last he could not get corn enough to feed himself and one poor horse. The horse died, and the farmer went to the city and opened a small store, where he peddled out what other farmers grew. It is a shame, said the furze. It is a shame, said the mosses. We think so, too, said the little potentillas and the the chickweeds. Let us see what we can do about it. So they covered the soil with soft mats to gather dew and hold in the moisture. Then clovers came, with their bacteria sacs, and all the nitrogen they could catch they tucked away into the soil. The mosses would not let it out. After a while a witty farmer came along, and he said, I will plant apples and plums on this beautiful hillside, and I will build a home. Now the rainbows are no more beautiful than these fields where the lazy farmer starved.

There was a little swamp in a hollow behind the hills, where the frogs liked to sing, and it was a dreary dell until a bird brought some seeds and dropped them on the mucky banks. Make us a beautiful garden, said the bird. And the seeds looked up at the stars and said, We will make it a star garden. So all the people as they went by called the beautiful blue flowers asters. They drank up the foul waters, and breathed out ozone. Then a farmer came with his plow and made a great corn field, and then he built himself a home, and if he would he might have had an aster for his crest. But he said, Let the blue flower have room, and let its friend the goldenrod have all the border lands, for they are marsh destroyers and health givers. So it is that the wild aster and the goldenrod will never be destroyed by the farmer, but for all generations to come will paint miles of hillsides and valleys with blue and gold.

A beautiful brook wound out of a glen. It had spent many a happy hour under the beeches and the hazels, jumping over stones, hiding under log bridges, chasing minnows with bubbles, catching leaves in eddies—all in the cold, dense shade. When it came suddenly out into the sunlight it blinked its eyes, and blinded, went headlong into a big pool. It wished to go back among the ferns and the mossy logs, but it was unable to flow backward, try as it might. It made the best of it. It started straight for a poor woman's garden, and there it made beans climb poles, with their waxy white pods; corn to wave its silken banners; marigolds like the sun and primroses like the moon. It turned the brown garden plot into the most delightful shades of color and, when it was through, it tumbled over a little fall, with a ripple of laughter, and went to sleep in a pond full of white lilies.

I will show you, said the bittersweet, what to do with an unpainted cheap little hovel. So it invited the Virginia creeper to go with it, and they climbed all over the walls and the roof until they had made it more glorious than a palace. Dense shade for summer; scarlet and gold for autumn, and swings for children. One day Corot went by and painted it. The picture sold for fifty thousand francs. Then the farm house grew

famous, and a poet bought it, and wrote poems there—poems that lived after the beams had rotted and the bittersweet was doing its best to cover the ruins.

The world waked up late in October with a marvelous fretted frost. Everything was covered with silver crystals. At the same time the Spitzenbergs looked out over the valley with cheeks redder and merrier than the day before. And among the millions of leaves there was not one that did not have an additional touch from nature's paint brush. Then all the things that lived and worked—lived because they worked—cried out, We are through! We have finished our labor for the year! Let us have a carnival feast! You should have been there to see. For miles and miles all the hillsides were spread with corn and pumpkins, and the corn was gold, but the pumpkins were even richer in color. And if you looked up, the trees were hung full of scarlet Spys and crimson Seeknofurthers and Golden Pippins. Purple grapes hung their cheeks against the houses, or festooned trellises and trees. Squirrels barked for joy. Beach nuts jumped from their husks and came down to the feast—brown and sweet. And the children came laughing because the nuts were falling. Maple trees went wild with delight, and garmented themselves with all the colors of the rainbow. More sober was the joy of the lindens and the elms. So nature wound up her year's work, not in dull weariness and disgust for work, but with glorious joy and pride in achievement. Nature loves color, and she knows just what to do with it. It is not a superfluity. It is always that which cannot be dispensed with—a real expression of life. It always has an intellectual bearing, and a good moral end. The free use of color makes the world more beautiful, but it also makes folk fairer-hearted and happier. What nature says to us in October is this, Let us make even decay delightful, and let us throw smiles over the past.

The Two Notes of the Church

THERE might be specified a dozen marks, or notes, of the Church, any one of which would, or should, give it character. Such are its holiness and its catholicity; for it is the Holy Catholic Church. Such, too, is its devotion to its Master, and such its dependence on the Holy Spirit. But when we consider the Church in its struggle and conquest two other notes are of chief importance, the one evangelism and the other unity. Of these the first is the note of its conquest, its task to convert the world to Jesus Christ, its note of war, of its military advance; the other, its note of unity, is that by which it maintains its disciplined phalanx, the army of conquest held together, and so moving forward with the concentrated strength and weight of all its numbers. It is not enough that soldiers fight; they must fight together, under one leader, and with the consciousness of that fellowship of warfare which will give them the courage of victory.

During the past week two of the largest and most important of our religious denominations, of about equal membership, have been holding their national meetings—the Episcopalians in Boston, and the Congregationalists in Des Moines. The two notes, evangelism and unity, ought in both cases to have dominated their sessions. We may say that evangelism, the missionary work at home and abroad, has had in both bodies pre-eminent attention. Plans are made for much more actively evangelistic work than for a long time past. We do not mean the old revival meetings, altho we may find ourselves in the midst of a revival before we know it; but the plans inaugurated will, with both denominations, be more in the way of religious instruction looking toward the recognition of a Christian purpose encouraged and taught from childhood.

But it is more the note of unity of which we have occasion now to speak. Of this note the Episcopal Convention has spoken strongly and well at previous sessions; and we mention elsewhere its less favorable action at the present Convention. This note of unity called forth the most remarkable scene in the meeting of the Congregational Council, when the report was adopted with the utmost enthusiasm for steps looking to final complete union with the Methodist Protestant and United Brethren bodies. Dr.

Weekley, who has led the movement for union among the United Brethren, and President Stephens, of the Methodist Protestant University at Kansas City, were present and spoke with great power and eloquence. Dr. Weekley's study of the rivalry of several small mission churches where one single church would be strong and self-sustaining had long ago turned his mind to the need of union, and his first thought had been to unite half a dozen of the smaller denominations, some of which are very jealous of their separate autonomy. President Stephens ably presented the view that the Methodistic fervor of his own body, united with the cooler sanity of the Congregationalists, would supply an intelligent Christian force which might do a great work for the Kingdom of God. Yet in their reception by the Council and in the action taken neither Dr. Weekley nor President Stephens observed any lack of Methodist fervor.

Already the Methodist Protestants and the Congregationalists have accepted the plan of union, and it remains for it to be accepted by the United Brethren at their General Conference next spring. Then the plan will have to be approved by the local conferences of the two before it can begin to be put into operation. It anticipates, for a while, the union of the three bodies in one General Council, and the union of their missionary agencies, while plans are being prepared for complete consolidation. These things take time, as there are separate interests to be cared for and protected. We may expect that within the next ten years very much of the scandal of a disunited Protestant Christendom will be removed. The Churches want union, but wait the guidance of intelligent Christian statesmanship. This union and that now assured of the Northern Presbyterians with the Cumberland Presbyterians are but the beginning of much greater things. Next year will see the federation of nearly all our Protestant denominations in something closer and more permanent than the old Evangelical Alliance, which has now ceased to exist, but which imperfectly led the way.

In union there is strength. It is not the mere aggregation of numbers into a big denomination that is to be desired, but that added force which union supplies. The great river will bear the freight of service and blessing such as a hundred small streams can never carry. The army must move forward to conquest, but the victory will be slow and doubtful if the cohorts are not united into one army. The two notes of the Church for the present day are evangelism and union.

A Suggestion That Was Lost

It is quite clear that, whatever shall be the result of the election, the question of the restraint of industrial combinations by tariff reduction or other legislation will continue to excite interest and discussion in Congress and elsewhere. Time may be saved and errors avoided by keeping a trustworthy record of past successes and failures. The record of what was done, and of unsuccessful attempts to do other things, in Congress a year and a half ago has not been fully told in the present campaign either on the platform or in the text-books. We are reminded of this by Senator Knox's speech last week in New York.

The Senator was talking about the Trust legislation of February, 1903, and the attitude of the President and himself toward it. He was then Attorney-General. The two Judiciary committees sought the views of the Department of Justice as to the legislation that was needed. "I had the honor," said Senator Knox in his speech, "to be deputed by the President to express the conclusions he had reached, and I did so." He then undertook to recount the suggestions made, and added that "every one of them" was promptly taken up and enacted before the end of the session. The statutes in question were those (1) expediting the trial of suits, (2) forbidding the reception of freight rebates, and (3) providing for publicity, as it was said, by inquiries by and reports to a bureau of the new Department of Commerce.

But the Senator appears to have forgotten the rejection of his suggestion for the restraint of industrial combinations by "penalizing the transportation of the goods produced by the guilty parties." This suggestion was embodied in the so-

called Littlefield bill of the House Judiciary Committee, which the House passed without one dissenting vote, and which the Senate declined even to consider.

It was a suggestion that Congress did not promptly or even tardily accept and enact, and as it was the most important one in the Attorney-General's list, we shall recall briefly the record of his connection with it.

The Attorney-General had first made this suggestion in his memorable speech at Pittsburg some months earlier. In the letter conveying to the chairmen of the two committees the President's conclusions and his own he urged the necessity of legislation for the protection of small producers "against piratical methods of competition" and "to cover discrimination in prices against competitors in particular localities," saying:

"Such legislation to certainly reach producers guilty of practices injurious to national and international commerce should, in my judgment, take the form of penalizing the transportation of the goods produced by the guilty parties; and the Federal courts should be given power to restrain such transportation at the suit of the Government."

It should be borne in mind that the suggested legislation was designed to restrain the Trusts of manufacturers which appear to be beyond the reach of the Sherman Anti-Trust law. In the same letter the Attorney-General recommended that "corporations producing wholly within a State, but whose products or sales enter into interstate commerce," should, if they were guilty of selling "below the general price in particular localities," or of seeking "wantonly to destroy competition in particular localities," be "excluded with their products from crossing State lines."

This was approved by Mr. Roosevelt, who said in a statement of his own, with reference to "discrimination in prices as against competitors in particular localities, resorted to for the purpose of destroying competition":

"In order to reach producers guilty of these offences who are, as producers merely, beyond national control, a penalty should be imposed on the interstate and foreign transportation of goods produced by them."

It will be observed that this was a vigorous attempt to reach, by new legislation, the great industrial combinations at which the Sherman act was aimed, but to which it appeared, by reason of certain decisions, that this act could not be applied.

Beyond all doubt it was the most important of all the suggestions which Mr. Knox and the President made, and must have been so regarded by them. Careful regulations for the application of this transportation penalty were set forth in a bill prepared by Mr. Knox and sent to the House Committee, and similar provisions were inserted by the committee in its own bill (afterward passed by unanimous vote) which also provided for publicity and forbade the reception of rebates, as did the two bills of the Senate which became laws. It may be remembered that when these Senate bills came over to the House Mr. Littlefield, apparently disheartened or disgusted, declined to vote for them.

How it came about that the Elkins and Hanna bills were so quickly passed, and the House bill, with its transportation penalty, was so speedily buried in a Senate pigeon-hole, we shall not attempt to tell. That is another story. But it was plain enough at the time that legislation for the enforcement of this transportation penalty—legislation which the President and Mr. Knox suggested and for which they asked in official communications—was the legislation which the great industrial combinations especially feared and desired to prevent. So far as we know they have suffered no serious inconvenience by reason of the Elkins bill or the so-called publicity provisions of the act creating the Department of Commerce. Mr. Knox said in his speech that these statutes were "a splendid record of constructive legislation." Possibly; altho opinions as to that may reasonably differ. But does he not think the record would have been more splendid and complete if his suggestion and bill for the use of a transportation penalty, to reach industrial combinations which are beyond the scope of the present law, had been enacted?

As to the wisdom or expediency of such legislation we are expressing no opinions except those of the Attorney-General himself, the President and all the

members of the House. We have read Mr. Knox's recent speeches upon Trust legislation and prosecutions, thinking he might—possibly in an unguarded moment—say something about that curious defeat of his cherished purpose. But he seems to have forgotten it.

A Great University

COLUMBIA UNIVERSITY is celebrating this week the one hundred and fiftieth anniversary of the founding of King's College in the province and city of New York, on the 31st day of October, 1754.

By letters patent George II on that date created "A Body politick and Corporate, in deed, fact and name," "for the Instruction and Education of the Youth in the Learned Languages, and Liberal Arts and Sciences." On May 1st, 1784, the Legislature of the State of New York —made independent by the treaty of peace with Great Britain—ordained "that the College within the City of New York, heretofore called King's College, be forever hereafter called and known by the name of Columbia College." This was the first recognition in law and history of the word and name *Columbia*.

From the outset the authorities of King's College held an extraordinarily broad conception of the scope of what is nowadays called the higher education. The first President, the Reverend Doctor Samuel Johnson, published on June 3d, 1754, a prospectus of instruction that included not only the ordinary college subjects of ancient languages, logic, rhetoric and mathematics, but also surveying and navigation, geography and history, husbandry and commerce, "the knowledge of all nature" and "of everything useful for the comfort, convenience and elegance of life in the chief manufactures." The entire field of university activity was thus pre-empted from the beginning. And not only was this large claim set up in words, but in deeds as well some effort was immediately made to realize it. A special professorship of mathematics and natural history was created in 1757, and one of moral philosophy in 1762. In 1818 Prof. John McVicar, the fifth incumbent of the chair of moral philsophy, was charged with instruction in political economy, whereby Columbia became, so far as can be learned, the first American college to provide systematic instruction in this subject.

For 150 years the development of Columbia has been almost continuously a progressive realization of the university ideal. Departments of medicine, law and engineering grew into faculties, and so likewise, in the decades 1880 to 1900, did the departments devoted to graduate instruction in political science, natural science and philosophy. Opportunities for undergraduate study extended to women led to the founding, in 1889, of Barnard College. Thus by the year 1890 the educational activities carried on under the authority of "The Trustees of Columbia College in the City of New York" had become in fact those of a great university, and in 1891 these trustees authorized the President of the College to describe the institution in its publications as a University. This was not done immediately, but on February 3d, 1896, the Trustees resolved "that in all official publications hereafter issued by or under authority of the Trustees all the departments of instruction and research maintained and managed by this corporation may, for convenience, be designated collectively as 'Columbia University in the City of New York,' or 'the University'; and the School of Arts, as the same is now known and described, may hereafter be designated as 'Columbia College' or 'the College.'"

The broad conception of education, which has thus shaped the growth of Columbia University, is the first condition of true university life in any seat of learning; but other conditions also are requisite, if the highest achievements are to be looked for. In these Columbia has been fortunate beyond precedent.

Her instructors and students have breathed the atmosphere of moral and intellectual freedom. Narrow sectarian influence was barred at the beginning. The charter of King's College expressly prohibited the making of any law, ordinance or order that should "extend to exclude any person of any Religious Denomination whatever from Equal Liberty and advantage of Education or from any of the Degrees, Liberties, Privileges, Benefits, or Immunities of the said College, on account of his particular Tenets in mat-

ters of Religion." The Board of Governors was made to include the Rector of Trinity Church, the senior minister of the Reformed Protestant Dutch Church, the minister of the Ancient Lutheran Church, the minister of the French Church and the minister of the Presbyterian Congregation. The charter of Columbia College forbids the applying of any religious test whatsoever to any professor.

The remaining condition of great university achievement in modern times is a situation in a center of great wealth and varied activities of civilization. Columbia on her magnificent Morningside Heights is at the center of what is destined to be, if it is not already, the largest and most wonderful aggregation of wealth and population that has yet existed on either side of the world. Here must come from every American commonwealth and from every land the men who would spend the years of their university life where are concentrated the greatest opportunities and advantages that civilization can bring together in one place.

That Columbia is to-day the leading university of the New World, and that in a few years it may, if all conditions continue favorable, be recognized as the leading university of the entire world, has been claimed, if not admitted. There is evidence of it in the tributes that have been paid within these last few weeks by the distinguished men of learning from all the centers of university life in Europe, drawn to America by the Congress of Arts and Sciences at St. Louis, who have lingered in this city on their homeward journey. One and all, they have ungrudgingly acknowledged the preeminence of Columbia in that graduate instruction which is the true expression of the highest university activity. With a larger teaching force than any other American university, a larger body of students exclusive of undergraduates, and a larger body of students, including college undergraduates, than any other American university save one, Columbia enters now upon a new period of her history, with an opportunity and a promise such as no educational organization has ever before enjoyed.

This promise, however, cannot be fulfilled without the heartiest co-operation of the wealth and intelligence of a metropolis that should look upon such a university as the object of its supreme pride. Columbia has resources measured by tens of millions, but resources must be measured relatively, not absolutely. By comparison with her immediate needs and opportunities Columbia's resources are altogether inadequate. She needs buildings, and, above all, she needs income wherewith to maintain instruction. As measured by the incomes of business men and men in the professions of law and medicine, the salaries of Columbia professors are much too low. It needs no argument to prove that the highest standards of instruction and research cannot be maintained unless men of the highest ability can be drawn into university careers, and this is not possible when there is a great and unjustifiable disparity between the material rewards of a professorial career and those of other learned professions. The enormously rich public of New York City must come forward with a generous support if Columbia University is to show at the end of another 150 years a record of such splendid achievement as is the record of her first 150 years, which she exhibits to the world to-day.

A Mistaken Decision

In every organized body of men, political or religious, there is one force integrating to life and another disintegrating to death. There are those who take into themselves the vital essence of the rising sun, and there are those whom it sterilizes and desiccates. Both these influences are seen in the decisions of the Episcopal General Convention. The great movement is progressive and vitalizing, but the conservatism which holds back Joshua's "good courage" and forbids him to "go forward" is also in evidence.

Several dioceses had asked permission to use the Revised Version of the English Bible in churches. One would think it hardly necessary to ask permission; that rectors might of their own authority make use of the most correct English version they might choose, whether it be the old Bishops'

Bible, or King James's Version, or the Revised; but it seems they did not venture to do so, and asked permission of the General Convention. This the House of Deputies refused, by a majority of both clerical and lay delegates.

It is a most amazing decision. It is universally admitted that the Revised Version is the more correct, that it expresses more closely the sense of the original; and yet, for no reason, except that they hate a change even for the better, they vote to keep the worse. This Revised Version was made by authority of the Church of England; Anglican scholars had the largest part in it; the English Church allows and approves it; the American Bible Society has decided to publish it, and yet this absurd action is taken. It would be past comprehension if the resisting inertia of dead habit and prejudice were not so familiar.

Here is another case, quite as remarkable, which this Convention, in its other House, that of Bishops, has shown us.

The National Federation of Churches and Christian Workers, which has been busy for several years in bringing together the Christian forces in cities and States, has asked the National Conventions, Conferences or Councils of the various denominations to meet by their delegates and consider whether they will not constitute a general organization to represent worthily and unitedly the Protestant Christian forces of the country. The meeting is to be held in New York in November of next year. Its success is already assured. Denominations representing ten million communicants have already accepted the plan, the Northern and the Southern Methodists, the African and the Zion Methodists, the Northern Presbyterians and the Cumberland Presbyterians, the Reformed Church and the Methodist Protestants, the Disciples and the Christian Connection, the Congregationalists and the Moravians, and there is little doubt that all the others will come in, to form one grand federation for the expression of their fellowship of union and for common service—all but the Protestant Episcopal Church. Their House of Bishops has returned the following answer to the invitation:

"HOUSE OF BISHOPS, GENERAL CONVENTION,
"BOSTON, MASS., October 13th, 1904.

"*Rev. E. B. Sanford, D.D., Secretary of Com. on Correspondence, National Federation of Churches and Christian Workers:*

"REV. AND DEAR SIR:

"I beg to acknowledge the receipt of your communication of date September 21st, 1904, to 'the Bishops and Deputies of the General Convention of the Protestant Episcopal Church in the United States of America, assembled at Boston, Mass.,' and to inform you on behalf of the House of Bishops that it has considered the same and has requested the Presiding Bishop to send reply in the following terms, which I have the honor herewith to transmit to your hand, viz.:

"That the concern of our communion for the advancement of Christian unity, both in the direction of doctrine and of polity and in that of co-operative Christian work, is a very earnest one; and that we desire to express the most cordial wishes for the true success of the federative movement in spreading the influence of Christianity in the solution of social and industrial problems; but we beg leave to add that, as the Federation is a voluntary association, in distinction from the official assemblies of the separate religious bodies, we consider that a formal and official appointment by General Convention of representatives to the proposed Conference is not required.

"Faithfully your brother,
"DANIEL J. TUTTLE,
"Presiding Bishop."

Thus the Protestant Episcopal Church, through its Bishops, declines to join with other denominations in any federative expression of Christian unity in Christian faith and service. This action is not what was to be hoped. It is not what might have been expected from the repeated utterances of the body in honor of unity, in deprecation of separation, in the formulation of plans of unity and in the invitations given to other bodies. This was a case in which no compromise was asked, no sacrifice "in the direction of doctrine and of polity," nothing more than the recognition that other Christian bodies are also working in their own way for the Kingdom of God. The reason given for declining seems more like a desired excuse than a valid reason. It is that the Federation which sends out the invitation is a voluntary society and not the official representative of any

denomination. This is true, but the invitation was sent by it at the official request of a most reputable denomination, for the very reason that it represents no one denomination, but many, tho not officially. It is abundantly well known, its standing is high, its service is honored, altho, like the Bible or Tract Society, it is a voluntary organization. Had the Congregationalists sent out the invitation it might have seemed as if they were assuming the lead; they therefore, in their National Council three years ago, asked this National Federation, with its Episcopal, Presbyterian, Baptist, Methodist and other representatives, to take the initiative. To no other national religious body has it occurred to decline because the invitation was not sufficiently official. The excuse hardly seems to be either ingenious or ingenuous. It is not too late, we think, for this action to be reversed on second thought, and this we hope will be done. The Episcopal denomination is so noble a body of Christian churches that its absence would make a great gap in the proposed Federation; and yet it is not so important a body that it can afford to exclude itself from the brotherhood of the faith. The mistake is so great that it should be rectified.

Wild Assertions Denied

Judge Parker's amazing chain of assertions defamatory of the American Government of the Philippines has met with speedy denial and correction from Governor Wright, who is himself a Democrat. The statements were so serious that it was proper to have an immediate contradiction, as they were made for immediate use in this brief political campaign. The denial comes from an interested party, it is true, from the man who is responsible for the chief administration of affairs there; but this does not disqualify him from telling the truth, in which he is supported by all available evidence. To describe our civil administrators there as generally "inefficient," "dishonest, corrupt and despotic," and that under the best sort of a civil service examination, was slanderous. Governor Wright says that the total defaults have been insignificant, and those mostly of men first appointed before the present system. Judge Parker says agriculture is ruined, farm animals have died and great districts are overrun by ladrones. Of these charges the only one true is that rinderpest killed three-fourths of the buffalos in a large region, but American occupation has no more to do with that than with an earthquake. Yet American occupation is to be credited with checking the disease by inoculation and importing animals from elsewhere. Taxation is much less than under Spanish rule, and ladrones have been completely suppressed, except in some almost inaccessible localities, so that life and property are as safe as in this country—not one band left in Luzon or the Visayan Islands. The extraordinary charge that newspapers are browbeaten into silence, the theaters censored and a system of espionage practised generally, is utterly baseless. Nothing of the sort is true. Judge Parker was grossly deceived by men who were guilty of wilful falsehood, and he ought to have known better. Archbishop Harty, Catholic, and Bishop Brent, Episcopalian, have told a very different story. Beyond question our occupation of the Philippines has been the greatest blessing to the people of the islands, while it offers an experiment in popular self-government such as no Eastern people but the Japanese have ever before tried.

When a Man Marries

When a man marries he becomes responsible for the support of a woman during her life. When he brings a child into the world he becomes reponsible for his support for twenty-one years. Even tho the opportunities for women to earn their own living have increased and a young man under the age of legal maturity is usually able to support himself and acquire an education, no head of a family will feel entirely free from anxiety until he has provided for those dependent on him at least to the extent of insuring them a decent living in case of his death. The question of how much money he must lay aside from his income to pro-

vide for this is one which every man is interested in, yet we have never hitherto seen it so clearly and simply answered as on another page of this issue. The plans there discussed seem to us a very practical proposition, and we fail to see why Mr. Weeks is so skeptical of their adoption by our readers. There is a constantly increasing proportion of men living on a salary, and while they can with some confidence anticipate that their income will not become less as the years go on, they can be almost equally certain that it will not be very much greater. Such a discussion as Mr. Weeks gives ought to be a guide to such a young man in the presence of the insurance agent, with his agate-bearing tongue and his blinding columns of irrefutable figures.

Popularizing a Missionary Society

One naturally goes to the American Board, the oldest, and still the leading, foreign missionary society in the country, for evidence of drift of sentiment and method as to mission work. The American Board has just held its annual meeting in Grinnell, Ia., and from there a train took the members a ride of an hour and a half to the meeting of the Congregational National Council in Des Moines. We will not stop to dwell on the fact that the missionaries who spoke were evidently men of superior mental power; nor yet the further fact that it is evidently the proper policy of the board to leave the missions to control of their work with very little interference at the rooms in Boston, telling them how much money they may use, and bidding them get the best results they can out of it; nor yet do we dwell on the successes reported; but we would call attention to the desire to popularize the management of the board at home. Hitherto there have been 350 corporate members, who only have the right to vote at the meetings and to select their successors, altho with nominations in part. It was voted at Des Moines to increase the number to 500. Of these a portion will be nominated by local conferences, each conference of twelve or more churches, half of whom have for two years contributed to missions, being allowed to nominate one member. The State conferences will nominate one corporate member for each 10,000 of their membership. All foreign missionaries of seven years' service will be corporate members, and there will be 150 chosen at large. But an important change is that these corporate members will hold office for but five years, altho eligible to re-election, and those already elected under a life term will be asked if they will consent to come under the five years' rule. These changes, recommended by a committee of which Dean Sanders, of Yale Seminary, was chairman, were adopted by a large majority and make the government of the board considerably more popular. Especially do we like the rule which gives voting rights to missionaries of experience returned to this country while still in service. They are not servants of the board and of its officers, but the officers and the board are their servants, and they should have the right at home as well as in the field to decide what shall be done.

Uniform Divorce Laws

Since the House of Deputies of the Protestant Episcopal Church at the Boston meeting proved to be almost equally divided on the question of the propriety of the remarriage of the innocent party where a divorce has been granted on the ground of adultery it is obviously futile to talk of securing an agreement between the people of all churches and no church and of different localities as to the conditions of divorce which could be embodied in a national statute. Public opinion on the subject is in a very unsettled, not to say transitional, state. The question of which is "the innocent person" in a divorce suit is not so easily determined as is generally assumed. It is not always the defendant. Both parties are often more or less to blame for the dissolution of the union, and it has sometimes happened that a man has been willing to sacrifice his reputation to secure a divorce from a guilty wife.

A Drunken Fleet

No excuse can be good for the attack by the outgoing Russian squadron on a peaceful fishing fleet, and no explanation is adequate except that the officers were

drunk. It is not enough to say that they were excited with fear of an impossible flotilla of Japanese gunboats for which they mistook the trawlers, for they turned their searchlights upon them, and any decently sober sailor would have known that trawlers in their usual fishing grounds are not gunboats. There have been testimonies more than enough of the misbehavior of officers in the Russian army and navy, and it is not past belief that on their departure for their long cruise they joined in a debauch which destroyed sobriety of judgment. It is a most serious act for a squadron of armed vessels to attack and sink boats of a nation with which they are at peace. It is an act of war and might easily lead to war. We do not suppose for a moment that Great Britain will make this an act of war, but we may expect that she will demand immediate apology and reparation. It would seem necessary that this fleet should be stopped on its way and required to return and make explanations. Certainly the officers who are responsible for this act of war should be cashiered. Nothing less would be adequate, and we believe that Russia will wish to do nothing less. It is ridiculous to suppose that Russia desires to embroil herself with Great Britain just for the purpose of making an excuse to withdraw from war with a superior force. This act is not statesmanship, it is maudlin folly.

Premier Combes Supported

Every white wall in Paris is scribbled over with "*A bas Combes,*" but he does not down. He is supported by the Deputies with a stronger vote than ever in his determination to abolish the Concordat and give France what she most needs, a free Church in a free State. A vote of 325 to 237 shows what the will of France is. And it means not any amendment of the Concordat, but its entire abolition, with a certain proper provision for the needy clerics who have depended on support from the State and must not be left to starve. Of course, the adherents of the old order are very sore; they believe the nation is becoming infidel. We had just such experiences here early in the last century, when such a State as Connecticut put an end to the support of its established Church. A multitude of its Christian people declared that it was French infidelity which had made the change, and they were partly right; but they did not understand how much stronger and how much more dear a Church is when it depends on the free will offerings of its adherents. There is not a man in Connecticut who would now go back to the old way, and fifty years from now, when the present priests are passed away, there will be no one left in France to mourn the Concordat; and least of all the Pope, despite condemnations of the doctrine of separation of Church and State. M. Combes begins his new campaign against the Roman Catholic Church with the defiance:

"Let those who will perform penance before Popes; I have neither the age nor the taste for such practices."

This reminds us that Bismarck under similar circumstances announced that he would never go to Canossa. He did not. He left that task to his successor.

Dr. Jayne, Bishop of Chester, is credited with the wish that people would not spend money on the adornment of churches while there are so many much more important matters that need to be attended to. As for himself, he added, "If any one should put in a stained glass window in my memory, I am sure my ghost would walk." That was probably meant to be an extravagant statement of one side of the truth. Our Lord did not condemn the expensive use of an alabaster box of ointment, very precious. Yet the place of show and beauty should be always subordinated to actual service. Perhaps the luxury of worship was carried too far in Canterbury Cathedral in 1563, when an inventory of that date credits the cathedral with possessing 16 chasubles, 67 copes, and other vestments and ornaments on a lavish scale.

Women, they say, will lose salaries of $30,000 in this city alone by the new Catholic rule which puts them out of the choirs. But what possible reason is there for the rule? Are women singers a danger to morals or to decorum? The rule is very nearly an insult to the most faithfully religious half of the world, and all by decree of masculine clerics. Why should we not some time have women cardinals?

Financial

The Mexican Loan

MEXICO'S new loan of $40,000,000 (at 4 per cent., to run fifty years) was awarded last week to Speyer & Co., of New York, this house being the head of a powerful syndicate with which a syndicate represented by the Banque de Paris et Pays Bas and the Bleichroeders, of Berlin, had been in sharp competition. The undertaking at once won popular support, as the advance sales of the bonds are said already to exceed $25,000,000. Included in the successful syndicate are the Mutual and the Equitable Life Insurance companies, the Union, Central and Guaranty Trust companies; the National City Bank, Harvey Fisk & Sons, Lazard Frères and other financial institutions in New York, as well as the First National Bank of Chicago, the Girard Trust Company of Philadelphia, the Old Colony Trust Company of Boston, the Deutsche Bank of Berlin and the houses affiliated with Speyer & Co. in London, Frankfort and Amsterdam. This loan is mainly for refunding purposes, but about one-third of it will be available for harbor works and other public improvements. The bonds will be issued in denominations of $1,000, United States money. This financial undertaking is regarded with much interest and approval by bankers and others who hold that the loans of the countries south of us should be negotiated in New York and not in Europe, because such a practice must tend to establish more intimate relations between this country and the borrowing republics and to avert complications that suggest a resort to the Monroe Doctrine.

Mr. Vanderlip Again

MR. VANDERLIP'S address at the Illinois Bankers' Convention attracts attention partly for the reason that, like his Wilmington address in 1902, it is regarded as an indication of the attitude and views of the most powerful and opulent of American financial groups. The Wilmington address was a note of warning; this one is decidedly optimistic.

There are signs now of a revival of business, it is true; the iron market is excited, with rising prices; the crops are safe and, on the whole, large; railroad traffic is growing again. As for the Stock Exchange market, which has become remarkably active, it may be said that current conditions warranted an advance, which has been assisted and emphasized by expert and powerful manipulation. With respect to its currency and its natural resources and products, the country is on a sound basis; with respect to industrial and commercial conditions, there is something to be desired. Some of the errors to which Mr. Vanderlip pointed in 1902, and of which he speaks now, exert an unfortunate influence now and will continue to do so. Among these are overcapitalization, various forms of inflation, unnatural prices and the discounting of future profits for present gain by speculators in control of industries. Industrially, the basis is not yet an ideal one to serve as a foundation for steady and enduring improvement. It does not follow that improvement and expansion are not to take place. Absolutely perfect fundamental conditions cannot be had at any time. Mr. Vanderlip's advice to bankers is good, but the average American banker who sticks to the banking business is in no need of it.

THOUSANDS of bushels of fine apples will be left to rot on the ground in Vermont this fall. Barrels cost from 35 to 50 cents, and the farmers cannot sell the best hand-picked fruit for more than $1 a barrel.

....Senator Clark's half interest in the new road from Los Angeles and San Pedro Cal., to Salt Lake City has been bought by the Oregon Short Line (Union Pacific system). The road will be finished within sixty days.

....Dividends and coupons announced:

Amer. Exchange Nat'l Bank, 5 per cent., payable November 1st.

Amer. Telephone & Tel Co., Gold Coupon Notes 5 per cent., payable November 1st.

The Independent

Vol. LVII NEW YORK, THURSDAY, NOVEMBER 3, 1904 No. 2918

Survey of the World

Corporations and Campaign Funds

In the closing days of the campaign, Judge Parker's speeches have become more aggressive. At Esopus, on the 24th ult., his subject was the relation of protected interests and Trust corporations to the campaign fund. Since the days of his active participation in politics, he said, there had taken place a startling change in the manner of conducting campaigns, "a change that introduced debasing and corrupt methods which threaten the integrity of our Government, leaving it a Government whose officers are practically chosen by a handful of corporate managers who levy upon the assets of the stockholders they represent such sums of money as they deem requisite to place the conduct of the Government in such hands as they consider best for their private interests." Any person, rich or poor, had a right to contribute for meeting the legitimate expenses of a campaign. Formerly, such contributions were devoted "to the legitimate advancement of the cause," and were not made "for the deliberate corruption of masses of electors." All this had been changed:

"Some of the enterprises which have unduly thrived through favoritism, and which have been permitted by statute to indirectly levy tribute upon the people, have in the course of time become so rich and strong that they can and do contribute vast sums when it is made clear that it will advantage them, and they contribute upon the promise, direct or implied, that they shall be permitted to continue to tax the people for their own benefit. Upon such promises contributions have been not infrequently made in such large measure as to induce and procure colonization, repeating and bribery in doubtful States."

Thus had been built up a class of voters known as "floaters," so numerous that party canvassers gave them a separate column in their books. The time had come to begin the fight "against those who would control the results of election contests for their private corporate interests":

"The excessively protected interests, which formerly poured out their treasure in order to continue existing and procure the passage of new laws permitting its further accumulation, have been joined by the combinations popularly called Trusts. Their plan is to perpetuate the present Administration. Such of the combinations or Trusts as do not profit by the aid of the tariff secure their profits by the exercise of monopolies. Hence their officers are opposed to the enforcement of law as against them. When such forces unite to furnish the money which they are promised will control the election, their purpose is as clear as noonday; it is to buy protection, to purchase four years more of profit by tariff taxation, or four years more of extortion from the public by means of monopoly."

Political contributions by corporations and Trusts, he asserted, meant corruption. A subscribing corporation expected that the party receiving its contribution would either "do something for the corporation or refrain from doing something to its injury." No other motive could be imagined or could exist. Would the public interests be safe, he asked, "in the hands of a party, the greater part of whose campaign funds had been contributed by corporations and Trusts?" Interests favored "either directly by statute or indirectly by non-prosecution of violations of law, control and possess many hundreds of millions of dollars":

"These interests have decided to attempt to continue the present Administration in power.

Their representatives scolded about the President for some months, and thus contributed their part toward the effort which was assiduously made to satisfy the country that the Trusts were opposed to the present Administration. Whether there were real difficulties between these great powers and the Administration—difficulties which have since been settled to the satisfaction of all parties concerned—or whether there were no difficulties to be compromised and adjusted, their action being but a play to deceive the voters, the fact remains that the Trusts are not now opposed to the continuance of the present Administration. On the contrary, it is common knowledge that they have determined to furnish such a sum of money to the Republican National Committee as it is hoped will secure the 'floaters' in the doubtful States for the Republican ticket."

The question ought to be settled now, he said, in conclusion, whether the "floaters" and the illegal combinations could control an election in this country.

Replies by Mr. Knox and Others

This was regarded by the friends of the President as an attack upon him. On the following day ex-Attorney-General Knox replied in a statement. Having asserted that Judge Parker had abandoned "his futile common-law panacea, which meant immunity to the Trusts," he thus commented upon the Judge's reference to a change for the worse in campaign methods since the time of "his active participation in politics:"

"When Judge Parker last actively participated in politics off the bench he was chairman of the New York State Democratic Committee which elected David B. Hill as Governor. He was a cog in the Hill machine. There never have been in our political history methods more debasing and corrupt than those of the Hill machine in New York, and they culminated in the steal of the State by the Maynard frauds, and the overthrow of the Hill machine in consequence. This was the machine which Mr. Parker ran until, as a reward for running it, he was made a judge by Hill, and these are the methods he deplores."

In saying that Trusts should be regulated by the State, he continued, and in asserting that the common law was sufficient, Mr. Hill and Judge Parker were bidding for the support of the great corporations. Now this attack upon them, "a last despairing effort," was utterly unworthy of the candidate of a great party for President. The Judge's own intimate associates and supporters, those who conducted his campaign for the nomination and were now conducting his campaign for election, were corporation men. Messrs. Meyer, McCarren, Belmont, Sheehan, Ryan, Hill and Taggart, "one and all," said Mr. Knox, "owe their whole power in politics to the intimate connection they have established between the management of corporations and the management of public business. Mr. Parker was created by them, would never have been thought of except for them, and has not now one chance of success, save what they give him."—There was published also an interview with an unnamed member of the Cabinet, who said that Mr. Cortelyou had never yet solicited a contribution from any corporation.—On the 28th Judge Parker replied to Senator Knox, who, he said, had been bidden to the presence of the President for a consultation to devise means for parrying the force of his speech. Mr. Knox had not denied that large contributions had been made by great corporations and Trusts, but had sought to raise a cloud of dust that would obscure the charge, which was "that vast sums of money have been contributed for the control of this election in aid of the Administration by corporations and Trusts." Judge Parker also spoke at length on the tariff, referring to the sales of American steel abroad at low prices, and asserting that protected combinations, needing tariff duties to facilitate the payment of dividends on watered stock, were "trying to give success to the Republican party." Criticising the Government for spending several hundred dollars for Governor Wright's cabled answer to his speech on the Philippines, he said that the "student of conditions," whose report he had quoted, was H. Parker Willis, who was vouched for by Carl Schurz and others. It appears that Mr. Willis, formerly a newspaper correspondent at Washington, has recently visited the Philippines. It was in the course of this speech that Judge Parker remarked that the "great activity of the leading officers of illegal combinations in favor

of the election" of Mr. Roosevelt might "account for the ability of both the Populist and Socialist parties to prosecute expensive campaigns" apparently in aid of the Republican party. Two or three days earlier Thomas E. Watson had said:

"Who financed Parker's campaign for two years? Who finances it now? Every child in America knows that the Standard Oil Company, the Havemeyer Sugar Trust, Belmont, the Banker Trust and the Railroad Trust are paying the freight. Why should they have been so anxious to have Parker nominated if they did not know that he was their man?"

Vice-Chairman Nicoll, of the Democratic Committee, offers to publish all contributions to the Democratic fund if the Republican Committee will take the same course.

Other Campaign Topics

Owing mainly to the assertion of Thomas W. Lawson that the Standard Oil millionaires procured the nomination of Parker and are contributing large sums to be used for him in the doubtful States, the directors of the Standard Oil Company, through their counsel, Mr. Dodd, publish a denial, saying that neither John D. Rockefeller nor any other officer of the company has taken part in securing the nomination of any candidate. It is also denied that there is any Standard Oil party banded together for speculation in stocks, or that the company is interested in steel, copper, or banking corporations.—Mr. Hearst's papers attack the Democratic managers for permitting Mr. Cleveland and Mr. Olney to take the stump, saying the latter are really Republicans, not in sympathy with the plain people. These papers also assert that the party is inconsistent "in professing Anti-Trust principles and at the same time including among its conspicuous leaders August Belmont, Cord Meyer, Thomas F. Ryan, Patrick McCarren and others of like kind."—Judge Parker has sent to Mr. Bryan a telegram thanking him for his "splendid service in Indiana and elsewhere during the present campaign." Mr. Bryan says in reply: "I am paying an instalment of the debt I owe the American people by endeavoring to secure for them the reforms which your Administration will bring."—General Miles has written a letter in the interest ot Judge Parker, in which he warns the American people against an "insidious change from democracy to despotism."—The invitations for a second peace conference at The Hague have been forwarded from Washington to the Powers.—Newspaper canvasses relating to the election show widely varying results. The Brooklyn *Eagle,* finding indications of a Democratic plurality of 182,000 in New York City, expresses an opinion and a conviction that Parker will be elected. The New York *Tribune* reduces this 182,000 to 62,000 and gives Roosevelt 314 electoral votes (239 are a majority). The *Herald,* which has inclined to the Democratic side, gives Roosevelt 257 and Parker 159, and regards the remaining 60 votes (those of New York included) as uncertain.

Panama Canal Questions

Passages in Secretary Hay's speech (on the 26th ult.) have drawn from Senator Morgan a long letter in defense of the Democratic Senators who opposed the Panama Canal treaty. Mr. Hay asserted that the President had in no way violated the Constitution or international law. Those who now accused the President of one of the gravest of crimes, a crime deserving instant impeachment, did not believe, he continued, one word they said. Plain proof of this was found in their willingness to go right on and "reap the fruit of our infamy by building the canal." They were saying nothing about restitution. "They will enter the house of sin which we have built, they will eat of the fat and drink of the sweet, rolling up sanctimonious eyes and thanking heaven they are not as those wicked Republicans." Mr. Morgan calls this "an insulting and mendacious statement," and asserts that Mr. Hay and Bunau-Varilla virtually extinguished the friendly Republic of Colombia. The Secretary sneaked out of compacts with Nicaragua and Costa Rica, he says, and sneaked into Panama, and he asks him to "cleanse his robes from contact with the culprits of the Panama Canal Company."—It became known last week that Clifford H. Smythe,

formerly Consul at Cartagena, had been sent to Panama and Bogota by the Democratic National Committee. Vice-Chairman Nicoll says that his mission was to obtain evidence in confirmation of a report that $250,000 was paid out of the United States secret service fund to President Marroquin, of Colombia, to induce him to connive at the revolt and secession of Panama. At last accounts no such evidence had been received in New York or discovered in Colombia.—At Washington the suit of Warren S. Wilson, of Hinsdale, Ill., for an injunction to restrain the Government from paying out any money on account of the Panama Canal is pending in the Supreme Court of the District of Columbia. Wilson holds that the Spooner act was unconstitutional, and that its provisions, relating to an agreement with Colombia, did not warrant any payment to Panama.

Prosecution of Lynchers in the South

The grand jury of the Federal Court at Huntsville, Ala., in response to the charge of Judge Thomas G. Jones—to the effect that the recent lynching of Maples, a negro, if due to race prejudice, was a proper subject for their consideration—have indicted several persons who were in the lynching mob. In their report they express the opinion that the mob was moved by race prejudice. They also say:

"Punishment must be inflicted upon those who participate in such mobs. Our people must stand stedfast and firm for law and order, for without these there will be no security or protection for the life, character, person or property of our children. The white people of this section owe a duty to the negro race. The law must be vindicated, order maintained and anarchy punished."

It is said that the men indicted are those who were acquitted in the State courts. Judge Jones is a Democrat, was a Confederate soldier, and was recently Governor of Alabama.—At Statesboro, Ga., Judge Daly charged the grand jury of the county that it was their duty to indict the lynchers of the two negroes, Cato and Reed, who were recently taken from the court house and burned at the stake. On the 28th, however, the jury finished their labors and returned no indictments, saying that the evidence was insufficient. It is predicted that Federal Judge Emory Speer will follow Judge Jones's example in laying this case before a Federal grand jury.—At Berkeley, Va., near Norfolk, George W. Blount, a negro, the owner of a fish market, was lynched on the 24th. He had been arrested for striking a policeman while the latter was trying to arrest another negro in his place of business. In the night he was taken from the jail by masked men, who beat him to death in the street. Owing to the excitement caused by this lynching the Governor sent a company of militia to Berkeley.

New York's Subway Opened

The new subway or tunnel railroad in New York was opened on the 27th ult. with appropriate ceremonies. At a meeting in the Aldermen's Chamber addresses were made by Mayor McClellan, Chief Engineer Parsons, Contractor McDonald, August Belmont (president of the operating company), Alexander E. Orr (president of the Rapid Transit Commission), and others. At about 2.30 p.m. the first train was started by the Mayor at the Brooklyn Bridge terminus, and with a silver controller he served as motorman until 103d Street was reached. Until 7 p.m. the trains were used by guests of the city and the company; at that hour the road from the City Hall and Brooklyn Bridge to 145th Street, a distance of nine miles, was opened to the public. Before midnight 110,000 persons had bought tickets. The receipts, $5,500, were given to the hospitals. On the 28th, the first full day, 350,000 passengers were carried. Great crowds besieged the entrances at the terminals on Sunday, and the capacity of the road was overtaxed. To the number of residents who sought the novel experience of a ride in this finely equipped subway were added thousands of visitors who came from adjoining States on excursion trains. The Mayor's first train ran from the City Hall to 145th street in twenty-six minutes. We published a description of the subway two weeks ago. The line now in use will soon be opened to the northern extremity of the island. Within a few weeks there will be added a part of the branch diverging at 103d Street, passing under a corner of Central

Park, then going northward on the East Side to and under the Harlem River, and terminating in Bronx Park. The extension southward from the City Hall to the Battery will be ready for use next summer. This will connect with a tunnel route to Brooklyn. The city owns the system, but it has been constructed under private contract with money which the city loaned to the contractor. He has the right to operate it for fifty years, with a right of renewal for twenty-five years. Within fifty years he must repay by annual installments the city's loan of $35,000,000 with interest. At the end of the lease the city comes into full possession of the entire property.

The Countries South of Us

By a decision of the Cuban Supreme Court the validity of the legislation of the recent session of Congress, questioned by the minority because of the House majority's ruling concerning quorums, has been upheld. The following statement as to Cuba's merchandise imports and exports during the last five calendar years is published at Washington as showing how the balance of trade has changed in favor of the island:

	Imports.	Exports.	Surplus or deficit.
1899.....	$66,783,100	$45,067,400	— $21,715,700
1900.....	66,658,000	48,904,600	— 17,754,000
1901.....	66,573,900	63,278,400	— 3,295,500
1902.....	60,584,800	64,329,700	+ 3,744,900
1903.....	63,464,500	77,242,800	+ 13,778,300

No considerable increase of exports can now be expected, it is said, without a large increase of the number of plantation laborers and of sugar mills.— In accordance with the decision of the arbitrators awarding $4,500,000 to this country on account of the claims of the Santo Domingo Improvement Company, the custom houses at the four leading ports of Santo Domingo have been placed under the control of John T. Abbott, the designated financial agent of the United States, who will use 60 per cent. of the revenues in satisfying the claims, payment being required at the rate of $37,500 per month.—In Venezuela a court has sustained the action of a lower tribunal by which it was ordered that the properties of the New York and Bermudez Asphalt Company be seized and placed in the hands of a receiver. An appeal to the court of last resort has been taken. It is reported that President Castro has filed in the courts of Venezuela a claim of $4,750,000 against General Matos for damages on account of the revolution in which Matos was the insurgent leader. Matos is living in Colombia, but he has in Venezuela extensive estates, which may be confiscated.— Señor Ramon Corral, recently elected Vice-President of Mexico, and regarded by many as the chosen successor of President Diaz, was entertained last week in San Francisco, where his children are being educated. At one of the banquets an impassioned address was made by Gen. Luis Torres, who spoke for the Mexican army and expressed the hope that the armies of the two republics would always he ready "to uphold the principle 'America for Americans.'"

The Attack on Hull Fishermen

All immediate danger of war between Great Britain and Russia on account of the bombardment of the British trawlers off Dogger Bank by the Baltic Squadron is averted by the agreement between the two Governments to await an investigation of the facts of the case by a commission organized after the manner of The Hague tribunal. General satisfaction is expressed in England over this peaceable arrangement, altho some of the jingo papers are still unsatisfied. As soon as the news was received, and without waiting for a report from his Admiral, the Czar telegraphed to King Edward his regrets at the occurrence and promised compensation. The King sent to Hull $1,000 for the victims of "the unwarranted action committed against the North Sea fishing fleet." Queen Alexandra sent $500 to the widows and orphans of the dead fishermen. At the Victoria Station, London, Count Benckendorff, the Russian Ambassador, was hooted by a mob. On the arrival of the Russian Squadron at Vigo Admiral Rojestvensky expressed his surprise and regret to learn that any British fishing vessels had suffered. He stated that about 1 a.m. two torpedo boats, supposed to be Japanese, appeared between the two divisions of

the squadron and seemed to discharge torpedoes. The Russians opened fire and thought they sank one of them. The other boat, he said, was doubtless the one which lingered in the vicinity for six hours, and which the fishermen mistook for one of the Russian squadron left behind. Prince Keretelli, an officer of the battleship "Emperor Alexander III," gave the following explanation:

"The transport 'Anatol,' which was steaming ahead of the squadron, was suddenly surrounded by eight torpedo boats, and requested assistance, whereupon the battleship division advanced and signalled to the unknown vessels to leave or disclose their nationality. The vessels refused to obey and advanced among the Russian battleships. Suddenly a cannon shot was heard from an unknown vessel. Then the Admiral formed in battle line and replied to the fire, afterward continuing his voyage."

An interview with the Admiral reports him as claiming that six shots hit the Russian vessels, damaging the cruiser "Aurora" and wounding two men, one of whom, a priest, had his hand shot off. Another report states that the priest's hand was torn off by being caught in the machinery. The suggestion is made that the torpedo boats which were taken for Japanese were really a detachment of Russian torpedo boats attempting to join the fleet. One of the Russian torpedo boats is said to be missing. Evidently the Russian officers expected an attack in the North Sea from Japanese torpedo boats purchased in England, and Admiral Rojestvensky is said to have slept only two hours between Libau and Dogger Banks. The Russians state that they had positive information of the equipment of Japanese boats at Swedish and British ports, and suggest that they were disguised as fishing vessels. The Japanese Government says that there are no Japanese torpedo boats in Atlantic waters. Ten Russian battleships and cruisers, with torpedo boats and colliers, are at Tangier; the rest of the squadron will remain at Vigo during the preliminary investigation of the affair. The Spanish Government has consulted with the Powers, and no objection has been made to the Russian ships remaining at this port under the circumstances. The Russian inquiry has begun at Vigo and the British at Hull. It is not yet announced where and when the international commission will meet, nor have details of its composition been decided upon. The suggestion of referring the question to a commission under The Hague convention is said to be due to M. Delcassé, the French Minister of Foreign Affairs, whose efforts in behalf of peace have been very energetic and efficient. Apparently the two Powers were on the eve of a conflict, for the British battleships were cleared for action and assembled at strategic points along the route of the Baltic fleet. All vessels under repair were hurriedly made ready for sea, coal was taken on and naval officers recalled to their posts. It seems that the Hull fishermen were not the only ones attacked by the Baltic Squadron in its course through the North Sea. The Swedish steamer "Aldebaran" was chased by a Russian cruiser, which threw a searchlight upon her and fired a number of shots without hitting her. The Norwegian steamship "Skaatol" was fired upon by a Russian ship in the English Channel. They also fired at a Danish torpedo boat while going through the Straits, but missed her through bad marksmanship.

The Lippe-Detmold Regency

The question of the succession to the regency of Lippe-Detmold continues to occupy a great deal of space in the foreign papers. Chancellor von Bülow has sent a letter to the Vice-President of the Diet explaining that the Emperor's telegram could not have meant to oppose the view of the Bundesrath that the succession question is not cleared up and that no obstacles will be placed in the way of the present exercise of the regency by Prince Leopold. Two points are raised against the House of Lippe-Biesterfeld. One is that Count Leopold's mother, the Countess of Wartensleben, was the daughter of Mathilde Halbach-Bohlen, of Philadelphia, an heiress of the coal mines, who in 1841 married Count Leopold of Wartensleben, and, since an American is not of royal blood, this contaminates the line. On his father's side the present *de facto*

regent is the great grandson of Modeste von Unruh, the daughter of a mere baron, which again taints the heredity. On the other hand, it is argued that if such stringent scrutiny is to be applied in the case of all the ruling powers of German states similar flaws could be detected in several instances. Lippe-Detmold has an area of 469 square miles, about a third that of Rhode Island, and 160,000 inhabitants.—The Minister of State in presenting the case to the Diet in support of the Government bill to continue the regency in case of the death of the insane Prince Alexander revealed a secret agreement made in 1886 between Prince Adolf, of Schaumburg-Lippe, the brother-in-law of the Emperor, and the late Prince Waldemar of Lippe, which provides for legislation recognizing the exclusive right of the princely house of Schaumburg-Lippe to the succession in the event of the extinction of the male line. By this act, according to the interpretation of the Minister, the House of Schaumburg-Lippe recognized the power of the Diet to pass on the matter, yet when the Diet declared in favor of the Lippe-Biesterfeld line, that House denied its competency. The semi-official telegraph agency, Wolff's Bureau, in reporting the Diet, omitted all mention of the disclosure of this secret compact.—The Emperor's telegram forbidding the troops to take the oath of allegiance to the Prince Regent until the legal situation be cleared up has started a discussion of the constitutionality of such action on the part of the " supreme war-lord " of the Empire.

M. Combes's Policy

Premier Combes has presented his plan for the separation of Church and State to the committee of the Chamber of Deputies. It is very similar to the plans hitherto proposed, but contains some new provisions for the purpose of making the change as easy as possible. An indemnity of $80 is to be paid to the clergy for four years, and the dignitaries of the Church are to be given pensions, according to age and rank. The Government will retain its supervision of public worship and to prevent disorder street manifestations of religious and anti-religious character will be prevented. There will be no French Embassy at the Vatican.—The Combes Ministry came within four votes of being defeated in a combined attack in the chamber on the administration of General André, the Minister of War. The *Figaro* declares that if he retains his portfolio it will arouse a feeling of indignation in the army amounting to mutiny. The army is in strong opposition to the Government, both because of the clerical education and monarchical instincts of the officers, and because the peace policy of the Government is regarded by them as unpatriotic.

Italian Politics

Following immediately upon the disastrous and revolutionary general strikes in the cities of northern Italy an election is being held which will result in bringing new issues to the front and in causing a new alignment of parties. Parliament assembled only to listen to the program of the Government prepared by the Prime Minister, Signor Giolitti, after which it was dissolved and the elections set for November 6th and 13th. Signor Giolitti's program endeavors to steer a safe middle course between radicals and reactionaries, and he says that his aim is to secure " the most ample liberty for all within the limits of the law." The recent riots are discussed rather more negligently than was to be expected, and the only remedies proposed are an increase of the police force and of the *Carabinieri.* Signor Giolitti has always opposed any increase in the strength of the army, and he is not now prepared to resort to that, altho during the present month's outbreak he has been compelled to call out the 1880 reserves to maintain order. The Premier recites the beneficial legislation which has been effected by his Ministry, and as a new measure proposes the acquisition of the railroads by the State. His opponents consider this as a very rash policy, on account of the poor condition of the national finances and denounce it as a mere electioneering dodge to attract the votes of the radicals and to stave off a strike of the railroad employees. It has been stated that the influence of the Government, which in Italy

is very much greater than is permitted in this country, will be thrown in the coming election in favor of any conservative candidates, even tho they may be opposed to the present Ministry, in order to check the rising power of the Socialists. At the same time Signor Giolitti announces his intention to oppose all reactionary movements and suggests as one of the remedies against the lawless excesses of the laboring classes "an education of the wealthier classes better suited to the necessitites of modern times." Many of the Italian prelates have united in a petition to the Pope to rescind the rule forbidding Catholics to take part in the national elections. No formal announcement of a relaxation of its traditional attitude could be obtained from the Vatican, but it is expected that in spite of the prohibition the Clerical vote will be large.

At Port Arthur

If the reports from Port Arthur are to be trusted that city is in desperate straits and cannot be expected to hold out much longer. General Stoessel is said to have telegraphed to the Czar: "I now bid you all good-by forever. Port Arthur is my grave." Provisions are scarce, the water supply is short and the hospitals are overcrowded. Over half the original garrison is dead, wounded or sick. The bombardment is so incessant that there is no opportunity for the decent burial of the dead. The soldiers are eating the horses killed by the bombardment. The new town west of the harbor has been destroyed by the high angle fire of the Japanese. Their shells have struck and sunk several of the Russian vessels in the harbor. On the morning of the 26th the Japanese made a furious attack on the eastern forts of the Keekwan group, north of Port Arthur, and silenced the batteries, exploding a magazine. A large part of the old town of Port Arthur is burned and the only smokeless powder magazine of the Russians has been destroyed.

On the Shakhe River

All is quiet along the Shakhe. With the exception of some skirmishing between the outposts, a few attacks and occasional artillery duels at long range, there has been no manifest activity during the week on either side. General Kuroki reports that the Russians have been driven from their last holding south of the Shakhe River, a high hill (Wai-Tao-Shan) about ten miles east of the railroad, where a regiment of Russian soldiers with five guns were entrenched. The Russian and Japanese outposts are now only a few hundred yards apart, both being well protected by natural and artificial defenses. The Russian soldiers are suffering severely from the cold as they have not yet received their winter overcoats and the country is denuded of fuel. The Japanese soldiers, on the contrary, are warmly clothed, and the Yentai mines are being worked at full capacity to supply coal for camps and railroad. General Kuropatkin has been placed in full command of all the Russian land forces, the order coming ostensibly from the Viceroy Alexieff. Field Marshal Oyama reports that the Japanese lost 15,879 men in the battle of Shakhe River. The official report of the General Staff at St. Petersburg gives the Russian loss in killed, wounded and missing between October 9th and October 18th as 45,000 men and 800 officers.

Disorders in Morocco

Continual fighting is going on between the tribes in Morocco, and the Government seems powerless to maintain order, or even to prevent foreign residents from suffering. The British steamer "Hercules" was fired upon in the Larache (El Araich) River and forced to leave without her cargo. [See map and article on Morocco, by the correspondent of the London *Times*, THE INDEPENDENT, Vol. LVI, page 1320.] An American and two German sailors were also fired at in the river, and one or more of them killed. The British Vice-Consul at Larache has sent to Tangier for protection, and a French and a British cruiser have been sent there. The Sultan issued an order that shipping of grain from port to port would be stopped, but as this aroused a general protest from the foreign consuls, who asserted that this would mean famine for all Northern Morocco, the order has been suspended three months.

Nemesis

BY ALFRED AUSTIN

Poet Laureate of England

Still surging, surging, surging onward, wave behind wave before,
Human billow-battalions rolling to War's insatiate shore,
Curving, swerving, breaking, reforming, ever replenished tide,
Wending, they know not whither or why, to die as their kin have died,
From wailing matron and weeping maid in famishing homes afar;
Roofless, sleepless, heedless, lifeless, doing the will of the Czar.

But sloughing the raiment of graceful peace, and winged with the scales of war,
And grafting on thoughts and things that were the things and the thoughts that are,
An ancient People, impelled by wrath at smart of a triple wrong,
Than doggedly dauntless yet dauntless more, than colossal strength more strong,
Scale peaks and passes, and clamber up cliffs that only the thunders know,
Till the granite Muscovite ranks are shattered, and scattered like drifting snow.

And the strong young Scion of yet young Sire keeps watch, but with war-flag furled,
And British sentinels motionless stand at the fortress-gates of the world,
While Nemesis nears fraud-pilfered Port with narrowing knots of steel,
And the prowling Sloth skulks snowward more, with the feet of Fate at its heel;
And high in Heaven reigns Right Divine, still wields the scepter and rod,
And worshipers throng to Buddhist shrines, praising the will of God.

Chateau D'Oex, Switzerland.

Imperialism

BY GEORGE WASHBURN, D.D., LL.D.

Ex-President of Robert College, Constantinople

IMPERIALISM, as used in the present political campaign, is a word which has no specific or definite meaning. It is used as a political catch-word because it has an ugly sound in a Republic. It is a bogey and nothing more. It has a meaning when applied to England or Russia. It had a different meaning when applied to France under Napoleon III, and has a still different meaning when applied to Germany to-day, but no one can imagine that the election of Mr. Roosevelt could be followed by the triumph of any such imperialism as that which exists in any of the European empires. What this country has to fear is Bossism rather than imperialism, and there appears to be but little to choose between the two parties on this score. Whatever danger there may be of such imperialism as that of Louis Napoleon comes only from the growth of corruption and lawlessness in the country, fostered as it is by the political, industrial and financial bosses and by race hatreds, which will naturally lead to a military despotism if it is not checked.

The word *imperial* has another meaning. It signifies *greatness*. In this sense most Americans are imperialists. They believe that the American Republic is "the greatest thing on earth" and resent any suggestion to the contrary as little better than treason if it comes from an American. I do not care to discuss the question how far this boast is well founded. I admit that the United States is one of the World-Powers. It is so by

its position, its population, its intelligence and its wealth. It is not a matter of choice with us whether the other Powers shall recognize us as such and hold us to the responsibilities of a World-Power or not. They do, they cannot help it. What Americans generally fail to understand is the fact that to be a World-Power involves serious dangers and solemn responsibilities from which we cannot escape. If it is imperialism to recognize these dangers and obligations, then the President and Mr. Hay are imperialists. Up to the time of our Civil War we were not generally regarded as a World-Power, but since that time the wonderful increase of our population, wealth and commercial activity, as well as our assumption of the right to intervene in behalf of Mexico against France, of Venezuela against England, of Cuba against Spain and in the Far East has gradually forced upon Europe the fact that there is a World-Power on this side the sea, European in race and religion, but untrammeled by the traditions and the conflicting interests of the rival States of Europe—a young and vigorous rival, not of one, but of all these states. The danger to us in this discovery grows out of the fact that the great Powers of Europe hold it as an axiom that all the rest of the world exists solely for their benefit, to increase the wealth and power of Europe. No one can live long in Europe, familiarize himself with its literature, follow its diplomacy and read its newspapers without seeing that this is the key to its history and has been for four centuries. The conflicts between the great Powers have been for the control of the commerce of the world. Other influences, religious and dynastic, have had their influence but, at the bottom, since 1492, and especially since the power of the Turks was broken in the eighteenth century, it has been the aim of the great Powers to dominate the rest of the world and make it tributary to Europe.

This has generally been justified on the ground that it was the duty of Europe to carry its so-called Christian civilization to the ends of the earth; but of late we hear less of this pretense, and it is now proclaimed openly that the world exists to support the commerce of Europe. This principle was proclaimed officially by Count Golouchofsky, the Chancellor of the Austrian Empire, four years ago, when he said to the delegations of the Dual Empire that it might be the chief task of Europe in the twentieth century to put down the competition of the countries beyond the sea, and this utterance was generally approved by the Continental press, tho not in England, where it was suspected that "beyond the sea" might include Great Britain. The fact that she also is feared and hated by the Continental states, that she is bound to America by special ties of relationship and is more in sympathy with our institutions than the other states makes her much more friendly to America than any of the Continental Powers; but so far as the rest of the world is concerned she shares the feeling that it is her mission to rule as much as possible of the habitable world outside of Europe, in the interest of her commerce. Her free-trade principles also modify the rivalry which might exist between us. There are no such limitations to the bitter hostility of the Continental Powers toward the United States as a new World-Power, which has many advantages over Europe and is every day growing in wealth and influence. We cannot meet this hostility by trying to persuade Europe that we are not so big, so ambitious, so dangerous after all, that, in fact, we are only sheep before the wolves of Europe; nor can we, consistently with our principles, propose to enter into partnership with them in the conquest of the world. We are not sheep and we have no desire to run with the wolves. We cannot conceal this fact any more than an ostrich can conceal his body by hiding his head in the sand.

In view of these dangers let us study the things that make for peace. Fortunately we have no such feeling of hostility to old Europe. We love it. We wish it well. It is our fatherland, and we do not grudge it any prosperity which it can gain in a fair way. But if we are to keep the peace it is necessary that our people and especially our statesmen should make haste to study and understand our position in the world and our foreign relations. Our Senators and Representatives are now too often only local politicians, interested only in the affairs of their own States. We have

statesmen of different parties at Washington who have studied and understand our responsibilities as a World-Power, but they are few, and there is no department of our Government which finds it so difficult to secure appropriations for its development or support for its measures than the department which controls our foreign relations. Our good fortune has given us, under different administrations and parties, distinguished Presidents and Secretaries of State, and we have now in Mr. Hay a true statesman, who is generally recognized in Europe as well as in America as the ablest Minister of Foreign Affairs in the world; but without the support of two-thirds of the Senate our President and Secretary of State are powerless. They cannot make a treaty. Our first duty, then, as a World-Power is to have a Senate which understands world politics and their bearing upon our destiny. Some great Power will some day teach us this lesson in war if we do not learn it for ourselves in peace. If we would avoid this calamity we must understand ourselves, realize what position we occupy in the world and learn what feelings and principles govern the action of other great nations, and this is not a short or an easy lesson. It demands a greater and more genuine patriotism than any party politics or local interests can call out.

I am not a party man and have not had an opportunity to vote in the United States since 1858, but I have followed the history of American diplomacy during that period with the deepest interest, and I am sure that President Roosevelt's management of foreign affairs since he came into office compares favorably with that of any President we have ever had; and that at this critical period nothing could be more unfortunate for our country than to exchange President Roosevelt and Mr. Hay, who have known how to defend our rights and maintain peace, who are recognized in Europe as supporters of The Hague Tribunal and of every effort to secure peace in the world, for men who, however honest and honorable, are unknown outside of America and without experience in dealing with international questions.

BOSTON, MASS.

A Buddhist Paradise in Korea

BY FRANCIS E. CLARK, D.D. LL.D.

PRESIDENT AND FOUNDER OF THE WORLD'S CHRISTIAN ENDEAVOR MOVEMENT

WE had gone ashore at the port of Fusan, on the southern edge of Korea, from the little Japanese steamer, the "Higo Maru," for a call on Dr. Irvin, the missionary doctor. "Come back to-morrow and we will go and see the old monastery at Pomasa," he had said to us with hospitable goodwill as we were about to leave. "I'll have everything all ready, ponies and chairs and 'chow.'"

We were glad enough to accept the invitation, for we must wait four days for the "Ise Maru," on which we were to complete the circumnavigation of Korea, and this trip to Pomasa would give us a chance to see something of genuine Korean life as well as one of the most remarkable religious retreats in the world—all this under the guidance of a beloved physician, whose medical skill half the monks in the monastery had tested at one time or another, so that we were sure of our welcome for our guide's sake.

Bright and early the next morning we were at Dr. Irvin's door, and there, true to his word, were beasts of burden, and men of burden as well, for three Korean ponies awaited the two men and the small boy of the party; two "giggie men" were ready to carry bedding and food, familiarly known as "chow," and nine coolies with three chairs were on hand to carry the ladies. Quite a procession we made when, a few moments later, we filed down the sightly hill on which Dr. Irvin's house is built. Nothing could be more exhilarating than this early start. The air was deliciously fresh.

The view on every side was entrancing. An outing on shore was something which we had not enjoyed for many a day. The prospect of novel sights which very few foreigners had ever beheld added more than a spice of novelty to the excursion.

At first our road lay along the bay of Fusan, but high above the water. Beyond its rippling blue waves were the mountainous islands that lock the harbor. On the other side the mountains of the mainland of Korea rose, tier on tier, until in the dim distance their tops touched the clouds.

If the more distant prospect was enchanting the nearer view was curious and interesting. Every moment there passed on foot or on pony-back some representative of the Hermit Nation, who could have been to our eyes no more curious if he had been a troglodyte just out of his cave in his prehistoric garments. In fact, all the passers-by were dressed in garments of prehistoric cut and fashion, for the Korean has not changed in costume or appearance, except perhaps to deteriorate and grow dirtier and shabbier, as the whole nation has degenerated since the Japanese conquest. The one thing that the Koreans resented bitterly in the recently attempted reforms by the Japanese was the cutting of their topknots. Their dynasty was threatened, their queen was murdered, a race of conquerors were about to usurp power. Yet none of these things moved the Koreans. But when their topknots were threatened, and the Japanese authorities decreed that they must be cut off, the Koreans were roused to desperate deeds. Topknot would not come down, and the threatened revolution and all the reforms were defeated. This intense conservatism and love of immemorial customs have preserved for us one of the primitive races of the world unimproved and unmodernized. A summer morning's ride in Korea presents many novelties and charms.

As we jog along on our vicious little native ponies we meet or pass all sorts and conditions of Koreans. Here is the married man, his marital state indicated

A City Gate in Korea—A Small Walled City on the Way to Fusan

A Married and Unmarried Boy in Korea, Rear View. The Top-Knot Shows the Married Man

by a topknot under a little wire cap, which itself is topped by a high black horsehair hat, which is uglier than any tile ever invented, except possibly the black " top " hat of Western civilization.

Here comes a youth with hair neatly parted in the middle and hanging down in a braid behind. " What a pretty girl," we said to our friend. " Oh, no," he replied; " that's a boy, and his hair shows that he is unmarried."

A woman passes by with long white skirts, but very inadequate upper garments. Here is a little group of Korean gentlemen clad in white silk, with beautiful (from the Korean point of view) high hats, which may have cost fifty dollars apiece. And here is a poor " giggie " man in dirty white tatters, bearing a huge burden strapped to his back on two forked sticks, whose prongs, sticking upward, support the load. All are in white, young men and maidens, old men and children. To be sure the white is often of a doubtful and dubious tinge, but, considering the places in which the people live and the work they are engaged in, the only wonder is that their garments are not far filthier. Out of a dirty mud hut will emerge a woman clad from top to toe in really dainty white, or in a peculiar tinge of delicate light yellow, which is even more pleasing. A peasant working in a plowed field near by will also be in white, or cloth that was once white, and can yet be made white by sufficient pounding on a flat stone in the stream that borders his rice field.

This partiality of the Koreans for white clothes gives a distinctive touch of color to travel in the great peninsula. At night ghosts are constantly gliding by you, and by day, tho the sun, the great disillusioner, reveals many a spot and stain, the quondam ghosts are none the less picturesque. By day and night they walk softly, like Agag, for their padded stockings, looking like huge white pincushions, and their straw sandals make no noise.

The monastery is twenty miles away from Fusan, and it is nearly a day's journey to reach it. On the way we saw specimens of almost every phase of Korean life. We passed through several

villages and two walled cities of considerable size, and the journey was a constant panorama of strange sights.

The houses are mostly of mud and wattle, low-browed little hovels, which one must bend low to enter, but all the tragedies of life and death, from birth to old age, are enacted therein. Over one doorway I saw a straw rope from which were suspended some pieces of charcoal, to show that within a week a boy

Group of Korean Gentlemen. Some of the horsehair hats shown in the picture are very expensive and cost as much as $50

baby had come to that home. Had it been blessed with a girl, only plain straw, without the charcoal, would have announced the event. No sooner were we well by this house of life than we ran into a procession of death, for a funeral *cortège* blocked the narrow way, and we had to crowd our ponies against the wall to let the dead man by. First in this procession walked, with cheap and gaudy banners, some ragged children, who seemed from their cheerful countenances to be enjoying a great lark. Then came an empty chair borne by four men. Then sixteen bearers in coarse sackcloth bore a huge red and green catafalque containing the coffin. Then some straggling mourners on foot, and the poor procession was over.

There is something indescribably squalid and tawdry about a funeral in China or Korea. It is difficult to associate grief or sorrow with it, or to sympathize deeply with the afflicted, as such a barefaced attempt is always made to make a great display, to outdo the neighbors, or, at least, to satisfy public opinion and "save the face" of surviving relatives. Yet, doubtless, hearts ache as they follow on behind the hired wailers and the dirty little banner boys, and even in this straggling, wretched procession some genuine tears are shed in spite of the holiday air which attends it and the feasting and gormandizing which will follow.

The villages through which we passed from a distance looked like vigorous growths of mushrooms, or like a collec-

tion of oval beehives. On nearer approach they resolved themselves into two or three narrow streets, bordered by mud-walled houses, with heavy thatched roofs which come within six or seven feet of the ground. The picturesqueness largely vanished as we came near, for distance lends most of the enchantment to the view of human life in Korea. The filth and squalor are too evident, and in activity and enterprise the inhabitants have nothing in common with a beehive. In fact, I have been told by well-informed people that nine men out of ten in Korea are absolutely idle. But this is not altogether the fault of the poor Korean. He would work if he had remunerative work to do,—but so poor is the country, so corrupt is the Government, so burdensome are the taxes, so little can any man count on reaping the fruits of his labors, or securing them from the rapacious tax gatherer, that ambition and enterprise have been crushed out.

The Koreans in some ways impress me more favorably than the Chinese. They are a finer looking race, more polite and urbane and not afflicted with the prying curiosity which makes the stolid stare of a crowd of Chinese coolies so maddening. Indeed, there is a certain courtliness of bearing about the average Korean that he shares with none of his brethren in the Far East. But he belongs to a decaying nation, to a dying people, and so long as the present corrupt dynasty is in power there is little hope for him.

All Korea's glories are in the past. Three hundred years ago she led all the East in many arts and sciences. Especially in the ceramic art did her people excel, but Japan's victorious armies overran her territory, carried off her best artisans, and bodily transferred the art of making beautiful porcelain to her own shores. Everywhere one sees signs of departed greatness. The gateways of the cities are often of huge stones, which could not be quarried to-day in any part of the country, except perhaps in the vicinity of Seoul, the capital. On them are carved devices in stone which could not now even be copied, so decadent is the native art of to-day. The ancient city walls are often strong and massive, while modern walls that have not stood a dozen years are crumbling to pieces, and in the breaches the small stones are actually seen to be tied together with string and plastered over on the outside with adhesive mud. The best bridges were built from four to six hundred years ago, while modern ones are poor, ramshackle affairs of wood that last but a few months or years. All this time the corrupt King, "the worst man in the country," as he is freely called, is wringing millions of dollars in taxes from his downtrodden subjects, which he squanders upon his favorites and the women of his harem. While he already has more than one expensive palace, built in Korean style, he is now building a foreign palace at the cost of a million dollars.

Many stories are told of the folly of this capricious, fickle, corrupt ruler who disgraces the throne of Korea. But we have not time to dwell on his follies, for all this time we are pressing on to the monastery among the hills, and the sins of the King and the poverty of the people cannot rob the country of its physical beauties. Peerless for its scenery among all the countries I have seen is Korea. It is a land of beautiful mountains and charming valleys; mountains clothed to their tops in living green, with rice fields and barley patches running far up on the mountainside. Through the valleys run, singing to the sea, little streams of clear water "that make the meadows green." We can quote a further line of Thanatopsis and say:

> "Poured round all
> Old Ocean's gray and melancholy waste,"

for few countries that are not islands are so completely surrounded by the sea as Korea; and everywhere the coasts are bold and strikingly picturesque. Through an ancient, half-ruined walled city our road led us, and there we stopped for a half hour to visit a tawdry, dilapidated temple, in which the only objects of interest are some imitation spears of wood and wands of office, and a great chair, with a torn and faded canopy over it, on which food and other offerings are made to the Spirit on the Emperor's birthday.

In this city the only surviving industry is the making of the little metal Korean pipes, which hold less than half a small

The High Priest of Pomasa

thimbleful of tobacco. The "rat, tat, tat" of the pipe-makers' tools was heard on every side, until we passed the further gate and began to climb the foothills which lead to the monastery. The chair coolies made a great to-do over their business, grunting and sputtering, and, for all we know, swearing in Korean at the lazy foreigners who will not walk more, and give them a rest, as tho they were not well paid for their work, which will give them a better lined stomach than they have had for many a day.

The Korean ponies are as slow as they are small, and as each has his own coolie to lead him, he can travel at only a very moderate walk. The sun toward midday grew very hot, which is also a discourager of rapid travel. But in spite of rather slow progress we "kept gettin' upper," like the much parodied boy in Excelsior, and every moment the view became more and more enchanting. Alps on Alps arise as we look landward, while, when we turned seaward, a little patch of blue that we saw through a notch in the farthest hills showed where old ocean lay asleep that bright May day.

In the near foreground were countless rice fields, the green paddy showing lush and rank above the water, which flooded it to the depth of two or three inches, while barley and a few coarser grains occupied every inch of arable land which the rice did not claim.

So much of Korea is mountainous and untillable, fully nine-tenths, if I am not mistaken, that every little nook and cranny of soil is made much of and coaxed to do its part toward the meager support of the twelve millions of people who live upon it.

At length the way became so steep that the chairmen declared they could carry their burdens no further, and those of us who were perched on the uncomfortable packs which surmounted the raw boned ponies' backs were glad to dismount and pursue the rest of the way on foot. As we approached the monastery not only did the view grow lovelier, but the immediate environment of our path became most charming. Fragrant pine woods hemmed us in and seemed to cover the towering mountains above to the very top. Rice fields became impossible, and even the barley patches gave

way to boulders and pine trees, but the small, irregular fields of different grains below us, each of a distinct hue of green, made the whole valley look like a gigantic, crazy patchwork quilt, while an occasional field of sesame in full flower gleamed like a glitter of gold flung upon the green fabric.

When nearly to the convent our road led between two curious poles that much resembled the totem poles of the Alaskan Indians, while the great rocks everywhere were beautifully engraved with Korean characters recording the merits of some man or family that had made a contribution to the monastery. Not far away on a hillside across an intervening valley is a community of Buddhist nuns, but whether they ever cross the valley and climb the rugged steeps to the monastery to visit the brethren deponent saith not. Just before reaching the brotherhood of monks we passed a row of most curious grist mills, such as exist, I venture to say, nowhere else on the face of the earth. A swift stream of limpid water here rushes down the mountainside, and is caught and made to pay toll a half dozen times on its way by being turned into a flume and thence into a series of troughs made of the hollow trunks of trees. One of the troughs does duty for each little mill. The other end of the log out of which the trough is hollowed runs into the mill, and to it is fastened a heavy upright cross piece, which then acts as a pestle; while in the middle it is balanced like a seesaw on another log. The trough is gradually filled by the running water until it overbalances the other end, which tips up, lifting the pestle in the air. But as the pestle end tips up the trough tips down, of course, and the water flows out, lightening the trough end, when the pestle end comes down upon the rice which has been poured into a hollow under it. I timed with my watch the motion of this curious automatic seesaw and found that in most of the mills it took a trifle less than a minute to fill the troughs so that they would tip up the pestle. Thus sixty times an hour the pestle comes down upon the unhulled rice, and, after

Buddhist Monks at Their Devotions

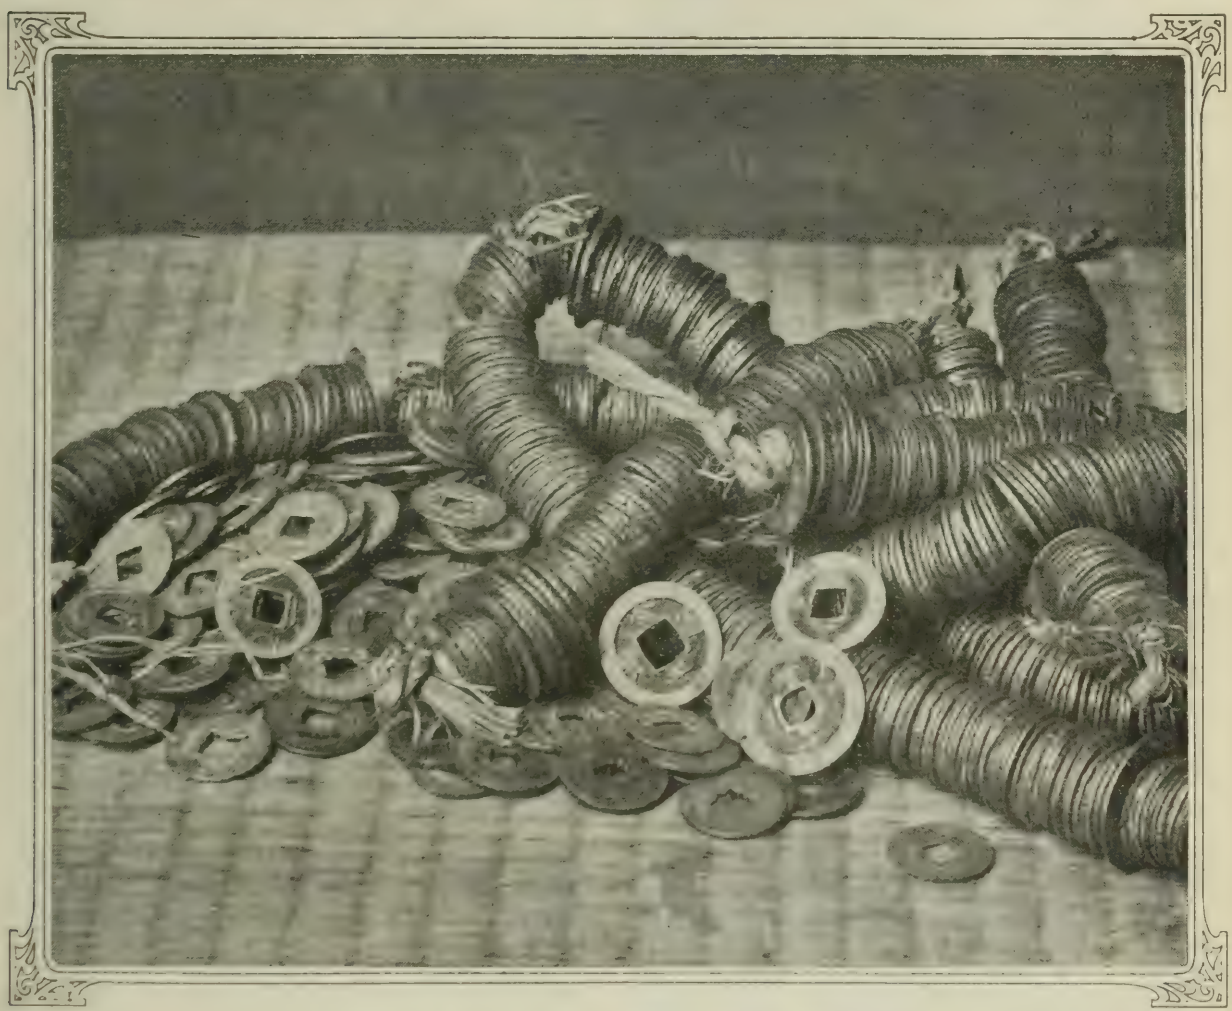
a while, loosens the husk. It would seem an utterly interminable process at this rate of speed, but time is not money in Korea. Moreover, this primitive grist mill works day and night, and one man can tend a dozen of them and have plenty of time left on his hands. It is admirably fitted—to Korea.

The chief temple is approached through a shabby gateway and a long flight of stone steps, and when reached it is neither exquisite and dainty, like the temples of Japan, nor imposing in its vastness, like the better temples in China. Tho this monastery is the richest perhaps in Korea, and owns vast fields of rice and barley, it partakes of the decay of the rest of the country, and is simply a shabby collection of half ruined buildings that would be much the better for a little paint, or even whitewash, or a few well driven nails. But it is unique in its shabby loneliness. So remote is it from the haunts of civilized man, so ancient in its foundation, so picturesque in its setting in a hollow between the bosoms of beautiful hills which rise on either side, that one feels that he has dropped down into a new planet when he enters these sacred precincts.

For many hundreds of years there has been here a Buddhist monastery, and the priests tell us that some of the great beams that we see were in the original building, but this is hard to believe. Four hundred priests here live, move and have their being, apparently dividing their time about evenly between praying and eating. They are despised by most of the Koreans and are not allowed to wear a topknot or the beloved black horsehair hat. So their heads are cropped, and a curious round affair, like the wire covers which our grandmothers put over the table dishes to keep the flies out of the food, surmounts their pates. Otherwise their flowing robes are not unlike the Korean national dress.

Few visit the monastery except at certain seasons, when the devout pilgrim wends his way thither; but day and night, summer and winter, year in and year out, are offered the ceaseless prayers which are interrupted chiefly by the frequent meals.

When we arrived a priest was executing a sacred dance, not unlike that of the whirling dervishes in Constantinople, except that he did not grow frenzied or spin around like a top at the end, but rather gyrated solemnly and gracefully, waving his hands and circling about the room with a soft graceful motion that was not unpleasing. Across the courtyard from the dancing priest was the main temple, furnished with a large Buddha, some smaller images of men and beasts, candles and incense holders and sacred drums, which were much in evidence day and night.



There were some attempts at ornamentation in colors within, but everything was so cheap and tawdry when compared with the Japanese temples that they were pitiful to look at, especially when we remembered the vanished past. But it was not difficult to see on these beams and cornices the rude originals of the designs in flower and fish and bird that make the temples of Nikko so beautiful in their lacquered splendor.

Outside the main temple is a great drum tower containing a huge, irregular shaped drum on a raised platform approached by a flight of steps. But the drum, like everything else about the place, is decrepit and worm-eaten and gave out but a feeble resonance.

We were received most cordially by the monks, even the chief priest himself giving us audience, and posing with great cheerfulness while the "camera fiend" of the party took his picture. He even ordered several small Buddhas to be moved from their pedestals so that they might come within the range of the camera's eye. He also served us with a first quality Korean feast while we sat cross-legged upon the floor. The little table which was furnished to each guest from the outside world was loaded with all sorts of delicacies, among which I remember cold pickled beech leaves, delicious seasoned seaweed, and the bark of an unknown tree fried crisp and brown, and served piping hot in sesame oil. This was really toothsome and appetizing. There were other vegetables of a more prosaic order, and, of course, the inevitable rice and tea. But no meat or fish or eggs, for the Buddhists are strict vegetarians.

At the approach of night we were graciously conducted to another temple

higher up the hillside, in order that we might not be awakened by the early devotions of the monks in the main temple, which summer and winter begin at two o'clock in the morning. In the smaller temple some dozen monks, whose guests we were to be, were eating their evening meal when we arrived, and, as they did not resent it, we watched the curious sight. A long grace preceded the first mouthful, in which blessing were sung

Pile of Korean Cash—Twelve to a Cent

over and over again in a droning voice the words:

"Namu Aba Tabul,
Namu Aba Tabul."
"I believe in Buddha,
I believe in Buddha."

Gongs were sounded and little wooden drums were beaten in Buddha's honor. Then the holy fathers gave evidence of very mundane appetites, for evidently "prayer and provender go together" in Korea as well as in Christian lands. First each one took a large leaf of lettuce and filled it with rice, sprinkling on the rice some kind of condiment and a judicious admixture of other vegetables, until a savory ball almost as large as a man's fist was prepared, enveloped in the great lettuce leaf. Then this ball was crowded into the capacious mouth waiting to receive it, but only with extreme difficulty. It had to be coaxed and squeezed and jammed in with the fingers of both hands. At length, however, it disappeared from sight, and was masticated with evident relish, while another similar vegetable cannon ball was prepared in the same way.

Whatever sins may be laid to the charge of the holy fathers, and, so far as I know, they live pure, virtuous, useless lives, lack of hospitality is not one of them. This was evidenced not only by their taking all our party in, and giving us of their best, but also by a little incident which warmed the cockles of my heart toward them as I beheld it. Other pilgrims besides ourselves had arrived that afternoon who were not so well provided with provisions. So, after the blessing, and after the rice and lettuce

had been dealt out to each monk in turn, the announcement of the coming of these hungry pilgrims was made, and, according to their custom, a brother went around to each well filled dish to receive contributions for the strangers. Each gave according to his ability and inclination, and the strangers' platter was well heaped when the last brother had added his donation. But there were evidently more hungry mouths than had been at first calculated, for again the strangers' platter went around, and again it was heaped from their own rice bowls. Then, having given this proof of practical hospitality, the monks fell to with a will, and doubtless their balls of rice and lettuce were all the sweeter for the self-sacrifice that had seasoned them. A worthy example this of individual benevolence instead of corporate charity, in these days when the milk of human kindness is often curdled by over-much organization.

After the monks had eaten their "chow" and we had eaten ours, which was largely extracted from tin cans of American manufacture, which we had brought with us, we were shown to our rooms in the back of the temple. Evidently they were the private bedrooms of the monks who had given them up for our accommodations, while they themselves slept where they could. A little room fell to my share with the small boy of the party, a larger one to the three ladies, while our missionary guide slept with the hospitable monks in the temple itself under the shadow of the big Buddha. My room was a simple cell about eight feet by six with bare white walls and not, I regret to say, wholly devoid of other inhabitants, in spite of the fact that the monks had left it. But the worst affliction was that our friends with too warm hospitality had built a fire in the kang beneath the floor, so that I was almost roasted on the hot floor before morning.

Very early in the morning, before the first streaks of dawn appeared, the services began, with much clatter of wooden drums and jangling of bells and chanting of human voices. But the noises were chiefly in the large temple below. They soothed us for a morning nap rather than aroused us, and when we emerged from our cells several hours later another service had begun, and the brothers were still telling their interminable strings of beads, strings yards and yards long, and still intoning in an apparently meaningless monotone:

"Namu Aba Tabul."
"I believe in Buddha,
I believe in Buddha,
I believe in Buddha."

The morning among the hills was exquisitely fresh and charming. Locked within our leafy bower the world with its turmoil and its troubles seemed far away—the blue heavens above us, the green, tree-clad hills hemming us in on every side, and nothing else visible, for all the other temples, even, were hidden in the greenery. A little stream sung its way over pebbles and swirled around boulders at our feet, affording that greatest of luxuries in Korea, pure water, uncontaminated by the paddy fields. Invisible cuckoos in the trees overhead struck twelve over and over again, tho it was barely seven o'clock, and the gentle rustle of the breeze in the trees seemed to tick off the seconds of a perfect day. In this still morning we could realize that for two thousand years monks had been contentedly counting their beads and saying their prayers, and eating their rice and lettuce—only that and nothing more. As we wended our way down the hillside past the never ceasing grist mills, and through the avenues of fragrant pines, we felt that if Nirvana had not been attained—and the faces of the monks, even of the high priest himself, gave no evidence of such bliss—it was because it could be gained in no *Buddhist* paradise.

BOYD M. ...

An American Consul's Work

BY WILLIAM THORP

AFTER the Presidential election is over, a lot of "hustlers" for the successful party will expect to be rewarded by appointments in the American Consular service. This will be particularly the case if the Democrats win, for it is probable that most of the present Republican Consuls will be continued in office if President Roosevelt obtains a second term.

For some occult reason, Consular positions are regarded almost in the light of sinecures. A Consul is supposed to draw a fat salary for "holding down his job," and the work is presumed to be light and easily performed by a man of average intelligence.

I have known American Consuls in several ports in Europe, in the West Indies, in Central and South America; have transacted much business with them, and became thoroughly familiar with their work. As the result, I can testify that few men have harder tasks to perform or more difficult positions to fill.

Let us take, for example, the day's work of an American Consul in an important British West Indian port, where there is much shipping trading to and from the United States, such as Kingston, Jamaica; Port-of-Spain, Trinidad, or Bridgetown, Barbados.

The Consul gets up about five or six o'clock in the morning—everybody rises early in the tropics—drinks a cup of coffee and eats a couple of oranges, and then gets to work to finish off his report on the new Colonial tariff, which has to go to Washington by the mail steamer sailing that afternoon. Some West Indian Legislatures, notably that of Jamaica, are unhappy unless they can produce a new tariff every session; and each new tariff must form the subject of an elaborate memorandum by the Consul. He has to write it in odd moments snatched from his sleep, his leisure and his family life. He knows that he cannot tackle it at his office, for he has too much routine work to do there and too many callers to receive.

About nine or ten o'clock the Consul goes to his office, and finds several people waiting to see him. Most of them are seafaring men. He picks out the mate of a Norwegian tramp sailing out of Norfolk, Va., whom he knows, and asks:

"Well, Jacobsen, what's the matter this trip? You're always bothering me! Why don't you go to your own Norwegian Consul?"

"It's dis young limb of der devil, sir," says the mate, pointing to a lad of seventeen whom he has brought with him. "We finds him in de for'd hatch, stowed away, as we comes down from Norfolk."

"Well, take him back with you on the return trip," growls the Consul.

"You pays der passage?"

"I suppose so, if he's under age."

One of the duties of the Consul is to send back to the United States, at the public expense, all stowaways who are minors. Sick and destitute seamen are also repatriated under some circumstances, but there is no such general rule as there is in the case of British sailors.

Hardly a day passes at the more important ports without the Consul being called upon to provide relief for a stranded fellow-countryman. Perhaps he is a "drummer," whose plans have miscarried, and whose remittances have not arrived, or a tourist who has spent more than he expected and finds himself without the wherewithal to get back to America, or a stranded vaudeville company unable to "walk the ties" when an ocean yawns between them and the lights of Broadway. Most frequently, however, the applicant is a sailor who has lost his ship, and is quite content to sit down in the rumshop until the Consul finds him another berth, or sends him to an American port. No public funds are provided for the relief of these numerous

applicants, except the sailors, but the Consul usually feels that it is "up to him" to do something.

It is hard to allow a fellow-countryman to be stranded in a foreign port, especially in the tropics, where a poverty-stricken white man soon sinks to the lowest depths of degradation. Sometimes the Consul gives temporary aid out of his own small income, but in most cases passage-money to the States has to be raised by subscription, and the Consul has to pass the hat among resident Americans.

Many of these applicants for relief are reduced to the last stage of misery and despair before they think of going to their Consul. That is why suicides occur not infrequently within the walls of American Consulates. Two have happened within recent years at the Shanghai Consulate, which is one of the biggest and busiest in the world. There is a scar on the ceiling of the Consul's office, covered with fresh plaster, where it was shattered by the bullet with which an unfortunate young fellow blew out his brains because he found at the last moment that he was too proud to ask for relief. At the same Consulate another man, for a similar reason, suddenly pulled out a revolver in the midst of a busy throng of people on the main staircase, and shot himself through the head. Similar tragedies have happened in other American Consulates, especially in the West Indies.

After the Consul whose day's work we are watching has arranged for the minor's transportation, he is buttonholed by a tough, old Cape Cod skipper, who tells a tale of salt water wo as long as that of the ancient mariner. His rickety old "windjammer," just arrived in port that morning, was over sixty days "reaching down from Pensacola." She ran into squall after squall, hurricane after hurricane; her canvas was blown into ribands, her seams opened and took in water by the ton. Food ran short, and the tired, famished sailors broke out into a mild mutiny, whereupon the skipper gave them a dose of marine law with a crowbar. Now he wants the Consul to send them to jail, and to make out a "bottomry bond," so that he can obtain money from the local shipping merchants with which to repair his ship.

Three of the crew drift in while the old man is talking. They interrupt him and tell their side of the story, which they garnish with many oaths, until the Consul threatens to have them thrown into the street. They assert that the ship is a death trap which the Consul ought to inspect and condemn, and that the skipper is a murderous bully who ought to have his ticket taken away.

It is an awkward case. The Consul is responsible for the punishment of mutiny; he is also responsible for seeing that American seamen are not maltreated, and that proper order and discipline are maintained on American ships while they are in his port. It is his duty to have the ship condemned if she is no longer seaworthy.

After dealing hastily with the rest of his callers, who have come on routine business, he goes down on the wharf and boards the ship. Half a dozen people try to tell him different tales at the same moment, and the Consul, with his wide experience of nautical quarrels, is soon able to decide that it is a case of "six to one and half a dozen to the other" between the skipper and his mates and the mutinous crew over whom they have tyrannized. It is a time for diplomacy, unless he wishes to have a bunch of cases in the local courts that will reflect no credit upon Americans. He draws the skipper aside and gives him a good cigar.

"Of course, you can prosecute these men if you like," he says, "and I will see that you get justice, but the case may tie your ship up for some time, especially as they will bring charges against you. Hadn't you better drop it? There are lots of men in port now, and I can fix you up with a good crew and ship these men somewhere else. Then I'll see to that bottomry bond right away, and you'll be able to sail after a few repairs."

After some further persuasion, the skipper agrees to this sensible arrangement, relieving his feelings by many full-bodied salt water oaths. As for the men, they are only too glad to leave the ship, especially when the Consul promises to place them on a British tramp. The American sailor who prefers to sail under the Stars and Stripes has yet to be discovered, altho the food on ships which fly the red ensign is distinctly inferior.

It should be explained, in passing, that every Consul who is worth his salt tries to prevent litigation among Americans abroad, especially in connection with American ships. If he does not succeed in doing so he is likely to hear some unpleasant things from Washington. At the same time, he has to be careful to intervene in the local courts in all cases which affect American interests, even remotely.

Returning to his office, our friend the Consul finds that a perspiring tourist, just arrived from New York by the mail boat, has taken possession of it. He is dressed in those comic opera tropical garments which nobody wears in the tropics, excepting the tourist. He presents a letter of introduction from some obscure Congressman unknown to the Consul, and evidently expects that the latter will drop all his work and show him around the place during the remainder of his stay.

But the Consul has met tourists before, and grown rather tired of acting as their unpaid guide. He gives some good advice about hotels, livery rates and places of interest, and gets rid of his visitor in half an hour—very quick time for one of his garrulous kind.

Then the Consul turns to his American mail. There are piles of letters and dispatches, dealing with pretty nearly every subject under the sun. As he wades through them, he is interrupted every few minutes to sign papers, examine immigration declarations, administer oaths to persons anxious to make affidavits, pass ships' manifests and perform a hundred other routine tasks.

The Consular mail is always extraordinarily varied. Besides a weighty bulk of official correspondence, there are letters from athletic clubs asking what games are played in the West Indies and how they are played; from old ladies in Wyoming whose great-great-grandfathers owned an unnamed sugar plantation "down there" in the eighteenth century, which they expect the Consul to recover for them promptly; from editors anxious to get "copy" for nothing; from college debating societies desirous of obtaining the Consul's views on the mental and moral capacity of the negro; from manufacturers of a thousand articles, ranging from war ships to safety pins, all eager for information as to their chances of selling their goods in the local market.

The Consul patiently answers all these letters, sometimes at great length, however absurd they may be. He knows by experience that if he does not do so a complaint will be made against him at Washington, and he will be held to account, even tho the questions may be entirely outside the scope of his duties. He knows, too, that not one correspondent in a hundred will have the decency to write and thank him for sending the desired information.

The official correspondence is generally three times as heavy as it ought to be. Besides the regular dispatches from his own department, the Consul is inundated with requests for information from all the other branches of the United States Government. He is fair game for any ambitious chief clerk or under-secretary who wants to gain *kudos* by producing a "masterly memorandum" on some such burning subject as the visible supply of spruce gum in the world. The official in Washington sends a circular to all the Consuls, sets them to work, and strings their replies together to form his masterly memorandum. They do the work; he gets the credit, if there is any. This is a scandal which ought to be stopped. Most of these memoranda are utterly worthless, and the Consuls are forced to waste much valuable time over them, to the detriment of their own proper work.

While the Consul is struggling with his mail, in walks a glittering orderly from Government House. His Excellency the Governor sends his compliments, and would Mr. Blank care to walk round the links with him this afternoon, if he is not too busy? The Consul sighs regretfully, for he has a lot of work left, and he knows he will have to burn the midnight oil over it; but he deems it good policy to accept the invitation. There are some important matters he wants a chance to talk over with the Governor privately, before he brings them to the notice of the Government officially. So he gets rid of his remaining callers, hastily glances over the rest of his mail, and goes off to play golf.

A Consul who can "keep his end up"

socially is worth a hundred per cent. more to his Government than one who cannot. I remember that when the late Speaker "Tom" Reed visited Jamaica he was rather disgusted to find the American Consul playing tennis in the middle of the day at Government House. He could not be made to understand that this might be more important work than signing papers at the office, that a Consul ought to be something of a diplomat as well as a great deal of a clerk.

Uusually the American Consul "keeps his end up" fairly well in official society, altho he is sadly handicapped by the smallness of his salary in comparison with that of his colleagues. If he is to do good work, especially in the semi-diplomatic position which many Consuls occupy, he must be a gentleman and a man of culture, able to cultivate personal intimacy with the men in authority, as well as official relations.

It goes without saying that he ought to be able to return their hospitality in a suitable manner, but few American Consuls can do so unless they have a private income. "When we deprive our Consuls of the necessary means to enter the social circle to which they properly belong, we reduce them to mere ciphers," said President Monroe. It is very true, but there has been little improvement in this respect since Monroe's day. "It is not sufficient to have our representative living abroad as cheaply as he can afford to exist," said Senator Sumner, "because his social position is an important factor in his power to be useful." Yet it is the regrettable fact, as a Consul wrote some time ago, that "there is hardly a Consulate in the world where the American representative is not the most shabbily housed, poorly served and poorly paid among his Consular associates."

The day's work of a Consul which I have briefly reviewed is based upon the diary of an acquaintance of mine now holding that office in the West Indies. It is by no means an exceptionally hard day's work, as a Consul's work goes.

Of course, the duties of an American Consul vary considerably according to the part of the world in which he is located. In great inland commercial centers, like Birmingham, England, he has little routine work to do, and devotes himself mainly to studying commercial and industrial conditions and making elaborate reports upon them.

In a big shipping port, like Liverpool or Hamburg, he manages a large office, and the mere routine work of clearing vessels, signing on seamen, looking after emigrants, attending to the United States cattle quarantine regulations, and so on, is enough to keep him busy all day long.

But the Consuls who have the most difficult and responsible positions are those assigned to Consulates at which the United States possesses extra-territorial rights, as in Turkey and China. The Consulate-General at Shanghai is a good type of these Consulates. There is, perhaps, no other place where the American representative has so much to do. He is not only the Consul, but the Lord High Everything Else, running a complete government in miniature.

He is at the head of a post office which handles all the mail of American residents and visitors; he manages a land registration department; he holds civil and criminal courts, and is the head jailor of the criminals after he has convicted them; he supervises a police force and a sanitary department, and he shares with the other foreign Consuls the entire responsibility for the government and administration of the foreign settlements.

The criminal cases brought before the United States Consul for judgment in a busy port like Shanghai include every variety of offense, from drunkenness to murder. In the more serious cases, the Consul selects two prominent American residents to sit with him as assessors and assist him to arrive at a decision. He has the power to sentence a man to death for murder, if it is committed upon the high seas; to life imprisonment, if it is done upon land. Such grave sentences must, however, be approved by the American Minister at Pekin. Consul-General Seward had to confirm a man to death a few years ago.

From this brief review of the work of an American Consul, it is apparent that, wherever he may happen to be located, he needs to be a good worker. In some lawless lands, where revolutions break out and American lives are endangered, he also needs to be a man of great resolution and physical courage.

The service is often denounced, usually unjustly. It has its faults, but it is better than the Consular services of most other nations. It is the only one of any importance in which the appointments are made for political reasons, and theoretically it ought therefore to be rotten to the core; but it is not. With all the disadvantages of the political association, there is this to be said for it—that the man who has been energetic enough as a politician to be rewarded with a job can generally be depended upon to be a "hustler" as a Consul, and that is a position for which a "hustler" is wanted.

Among the many Consuls whom I have met in the higher grades of the service, I can recall only one or two who did not creditably represent their country. Many of the Vice-Consuls and Consular and commercial agents are men of low standing and inferior ability. They are usually natives of the country in which they serve, and often are colored men. They are paid by fees, and, of course, good men cannot be obtained for an irregular position to which no salary is attached. Grafters and incompetents are to be found among the Americans in the higher ranks of the service, but they are exceptions, like the Consul in an English town, who preached at a local church every Sunday for ten years on a regular stipend, until Washington found him out, and ordered him to desist, or that other Consul at a Red Sea port some years ago who got drunk by noon every day and left his Arab *kavass* to run the Consulate.

On the whole, politicians who are looking for a sinecure after the election had better avoid the Consular service. The standard has risen greatly in recent years. There is plenty of hard work, which cannot be properly performed save by a man of tact, energy and abundant versatility. The salaries are utterly inadequate in view of the social position a Consul is expected to occupy. If he assumes that position, he cannot save money; indeed, he is lucky if he manages to keep out of debt. And, lastly, the ambitious politician may be quite sure that unless he is an educated gentleman, as well as a politician, his life as a Consul will be made very unpleasant for him wherever he may be sent.

NEW YORK CITY.

By the Helicon Well

BY WILLIAM HAYES WARD

[These lines were written as a prelude to lines by the same author entitled "A Dinner of Herbs," in *The Century Magazine* for November.]

I BUILT me a cot by the Helicon well,
To find from the fretwork of care surcease;
Its hearth was rest, and its rushes were peace.
In the rim of the stream I dipped my shell;
And I fed me with herbs that were fed from the fount,
The bounty of mallows and parsley, with fruit
Of the clustering vine, and succory root,
The wild plum's blush,
And the seedy pulp of the medlar bush;
And black were the berries I plucked and ate;
And I cared not for fate.

And the gods I saw in war or in play,
As they tossed the lightnings from mount to mount,
Or they sat down to feast on a festal day.
But I piped with my oat, and I envied them not,
Content with my lot.

Bright Iris slid down one slumbrous day;
In a flutter of color she dropped on my sight
At the door of my cot, and she called me away:
"A laurel-crowned guest of the gods art thou;
Then follow and feast with the gods to-night."

But I answered her, "Nay!
The gods, they are gods; to their fates I must bow;
But the meat of immortals immortals may eat;
The nectar of gods is no nectar for me;
Their quarrels and kisses I care not to see.
In my cot, by my hearth, I set me my seat,
Let the Thunderer hold the hights that are his,
But I'll cook me a dinner of herbs, I weet,
Where Peace is"

NEWARK, N. J.

Freight Tunnels in Chicago

BY GEORGE W. JACKSON

[Now at the time the whole country is interested in the opening of the New York Subway (an article concerning which appeared in our issue of October 20th), the following account of what Chicago has already done in this direction by the general manager and chief engineer of the Illinois Tunnel Company is most timely, especially as the Chicago tunnel seems to be little known of outside of Chicago and not to have attracted the attention it unquestionably deserves.—EDITOR.]

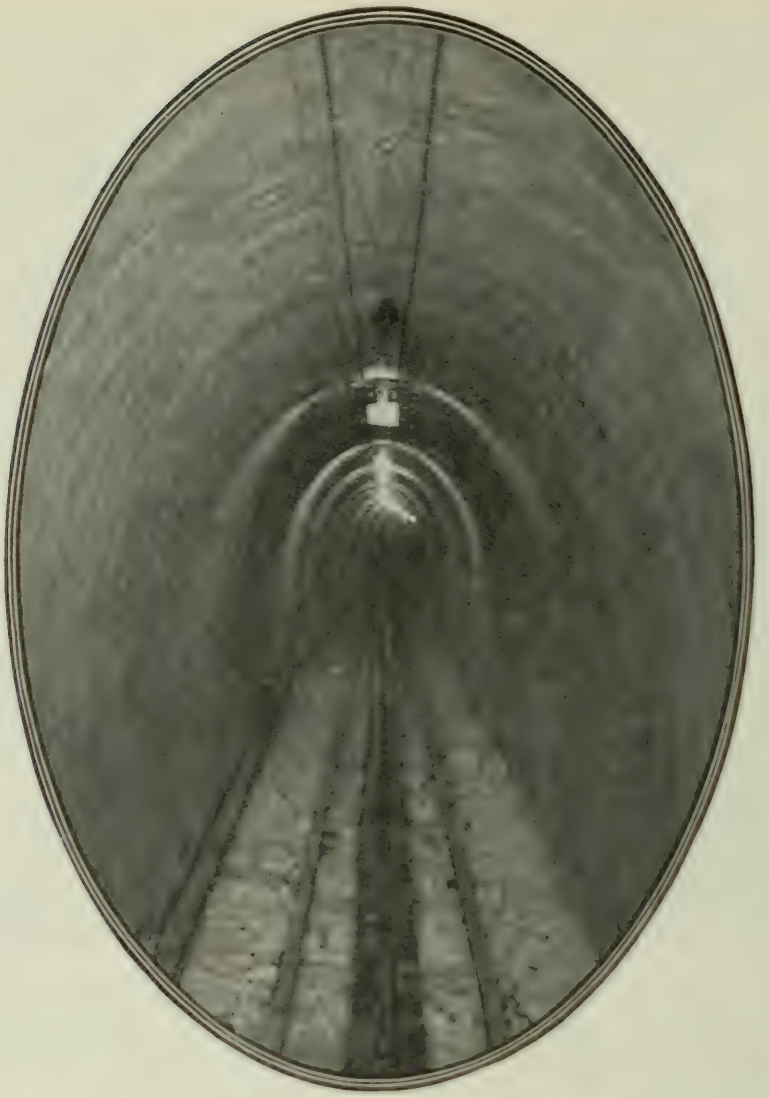
SIXTY miles of tunnels are being constructed under the principal streets of Chicago. Twenty-six miles already have been completed. Over a narrow gauge electric railway in these conduits the Illinois Tunnel Company expects to transport 50,000 tons of freight daily after January 1, when it hopes to begin commercial operations.

So quietly has the work been carried on, with no interruption to traffic and no obstructions in the streets, that only a small percentage of Chicago's population is aware of the scope of the enterprise, or of the fact that the business district will be honeycombed with shafts, leading to all of the railroad stations and to the principal mercantile establishments.

Under an ordinance granted by the City of Chicago on February 20th, 1899, the Illinois Telephone and Telegraph Company — a new corporation — was given a franchise for the use of space under the streets. It constructed a network of large tunnels beneath the business district, with roofs not less than

Branch Tunnels Leaving Main Shaft Superintendent Jackson at Electric Lever of Train on the Left

Loaded Trains in the Chicago Subway Tunnel



twenty-four feet from the surface. These tunnels are of two sizes, the trunk conduits being twelve feet wide and fourteen feet high and the branch shafts six feet wide and seven feet six inches high. The material is cement, which in the larger tunnels is twenty-one inches thick at the bottoms and eighteen inches at the walls.

Under the roof and along the walls of the tunnels on each side are strung the telephone cables, leaving space on the floor sufficient for a railway. The company in July, 1903, therefore secured an extension of its franchise rights, permitting it to operate apparatus for carrying freight of all kinds and for handling mail matter, packages, newspapers and other articles. The Illinois Tunnel Company last January acquired the system.

More than two miles of twenty-four inch railway already have been built, and this mileage rapidly will be increased until all the shafts have been equipped. Over these rails will run trains drawn by electric locomotives, now in successful operation. The cars are wholly of iron and steel and are twelve feet in length. Each will have a capacity of thirty thousand pounds of freight. The trolley system of propulsion is being used, driving the trains at a speed of from fifteen to twenty miles an hour. A five thousand horse-power electric plant soon will be in operation.

Upon the completion of the track laying, three thousand cars and one hundred and fifty locomotives will be put in service. These will run to the six great freight depots of the twenty-five trunk railroads which center in Chicago. All of the stations are within a section less than two miles square, and the enormous freight traffic of the city has caused congestion in the streets. The tunnels will relieve this, as they are expected to take as a single step nearly all of the four million tons of coal burned annually within the "loop"—the elevated railway marking the center of the business district.

The system of handling the freight will be simple. Shafts are being constructed from the tunnels directly into the freight houses of the railways, and the tunnel

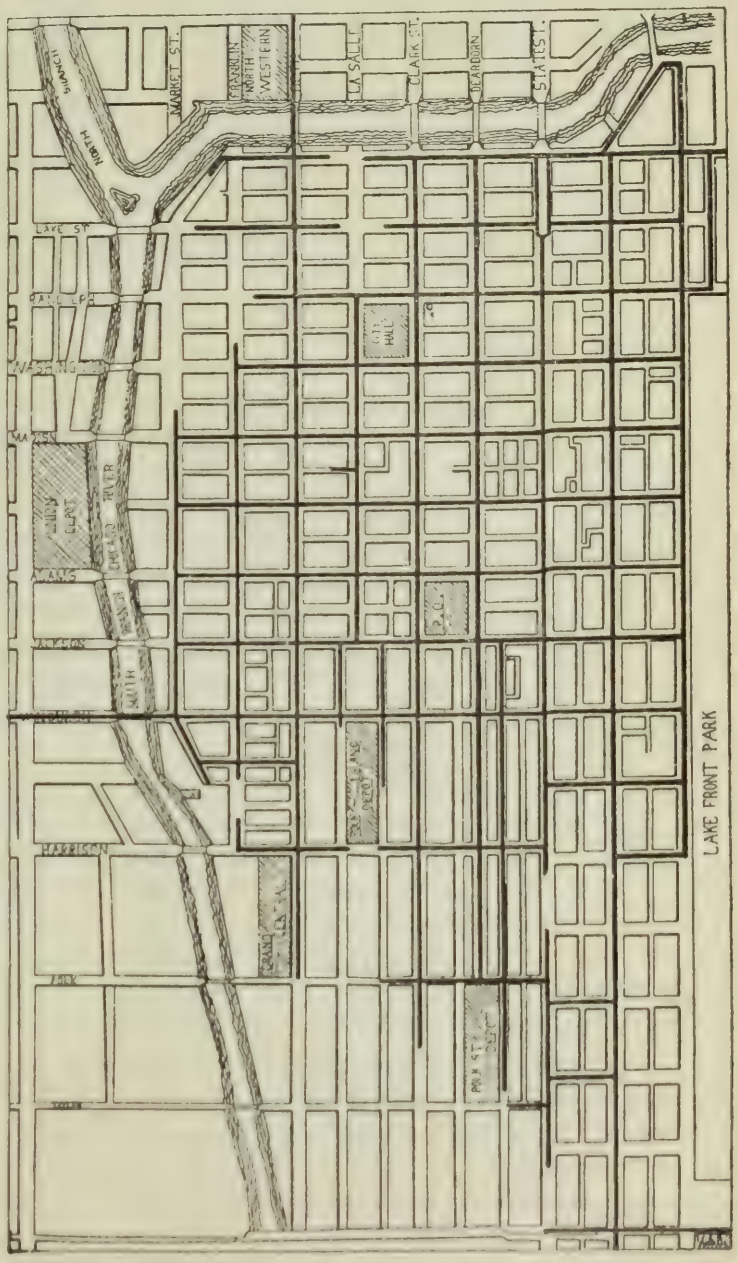
Section of Tunnel, Showing Third Rail Electric System of Illinois Tunnel Company

cars will be lifted on elevators to the sides of the freight cars ready to be unloaded. When the underground car is filled it will be dropped again into the tunnel, ready to be unloaded at the warehouse of the consignee or placed in the Tunnel Company's storage quarters to await his orders.

Nearly every large business house in downtown Chicago will have shaft connections with the tunnel system, elevators like those at the freight depots carrying the cars into the stores or storage houses. As the tunnel cars will accommodate any object that can be passed through the door of any railway freight car, there hardly is anything which the Tunnel Company cannot transport to the merchants.

The installation of this system will remove thousands of wagons from the downtown streets, keep them cleaner, and make the handling of freight much cheaper than it is at present. Chicago is the only city in the world to employ an extensive system of this kind, and the effect of its successful operation will be incalculable. There is little doubt that New York, with its subway for the transportation of passengers, will follow with its tunnels for the hauling of freight, and other crowded cities cannot but profit from the change from old to modern methods.

A feature of the tunnel system is the great distributing station at the river and Taylor Street. The Tunnel Company a few months ago purchased for nearly $2,000,000 seven large warehouses for use as its terminals. All freight not immediately desired by the consignee, and all of which must be re-routed, will be shipped to this center. All the trunk lines of the tunnel meet here, and the cars



can be elevated to the tops of the seven-story building and unloaded there. Merchants buying in large quantities save great sums, and fall, summer, winter and spring stocks often begin to arrive months before they are placed on sale. The larger merchants have their own warehouses for the storage of these goods, and shafts will extend to their warehouses. The smaller dealers, however, generally are deterred from purchasing in advance because they lack room in which to place their stock. Under the new system this may be stored in the Tunnel Company's houses and taken out in small lots, just as the retailer desires it.

The ultimate intention is to extend the tunnels into the manufacturing districts, and far away from the business section. Not until the down-town system has been put in successful operation, however, will the tunnels be dug further than present plans provide. The work now on hand is to connect them with the freight depots and basements of buildings.

The construction of the tunnels has been an enormous undertaking. Work was begun in an alley near Madison and Monroe Streets, west of La Salle Street. Seven other shafts were started at various places in the downtown district. It then was found that the city street maps were inaccurate, and a complete new topographical survey was made. The pneumatic system was used in the excavating. Airlocks were placed just inside the several shafts and air under pressure was admitted into the portion where the men were working. The shafts were made larger than the dimensions of the finished tubes, allowing a space of nearly two feet at the sides. Iron ribs were placed at short intervals along the inside, and within these were built walls of wood. In the space between the inner and outer walls, cement, stone and gravel were poured, making a solid mass that would uphold all weights in the roadways above. Another system of false work used was that in which steel plates were placed to support the cement while it was drying and to permit the workmen to tamp it down firmly.

The work was carried on by three shifts of men laboring eight hours each. The first gang of miners went on duty at 4 o'clock in the afternoon and worked until midnight; the second labored from midnight to 8 o'clock in the morning, and the third, which was known as the concreting shift, began at 8 o'clock in the morning and worked until through. The last completed their tasks so the miners could resume work at 4 p.m.

The distance excavated by the two

Map of Central Business District of Chicago, Showing (in Heavy Lines) Network of Tunnels

shifts of miners averaged twenty-one feet at each heading. The number of headings was around fourteen. It required twenty men to operate each heading, and 850 were engaged in tunnel construction, while 600 others were employed in the offices and in hauling gravel, stone, cement and excavated material. Nine hundred tram cars were used in removing the dirt, which was taken out at the rate of more than 400 running feet a day. The cars were hoisted up the shafts to the elevated houses a few feet above the street, and from these the dirt and stone fell into wagons beneath. The dirt then was hauled to the lake front, where it was used in increasing the size of a city park. Later the method was changed by having a tunnel extended directly to the lake front, removing the necessity of teams for hauling the filling. At another end of the system the cars were run out upon scows and the clay taken down the river. It is estimated that more than 4,950,000 cubic feet of dirt have been excavated.

The Illinois Tunnel Company has an authorized capital of $30,000,000 and a bond issue of the same amount. It has issued only $15,000,000 of the bonds, however, holding the remainder to pay for future extensions of the tunnels and of the transportation and telephone systems. The officers of the company are: President, Albert G. Wheeler, of Chicago; Vice-President, C. D. Simpson, of Scranton, Pa.; Secretary, Edward W. Gearhart, Scranton; Treasurer, John C. Law, of Pittsburg, Pa.

CHICAGO, ILL.

Sanity, Enthusiasm and Unity

BY D. S. STEPHENS, D.D.

CHANCELLOR OF KANSAS CITY UNIVERSITY, KANSAS

[This article is the substance of an address received with the greatest enthusiasm at the Congregational National Council. Dr. Stephens represented the Methodist Protestants in the proposal for union of the Methodist Protestants, United Brethren and Congregationalists.—EDITOR.]

AS desirable as a union of Churches may seem to be, from many points of view, I cannot think such a union greatly to be sought for until it becomes the expression of a vital organizing spiritual impulse. All real union must be wrought out by a vital power. It is expressed, not in aggregation, but in integration. Ecclesiastical aggrgation may have charms for some minds that delight in mere hugeness. But the union that Jesus Christ had in view when he prayed that his followers might be "made perfect in one" is realized only when a common enthusiasm—a consuming inspiration—fuses the hearts of men into oneness of life. No matter how wide apart Churches may be in historical origin, in usage, in religious ceremonial, a dominating spiritual purpose will make the path to union easy. But if there is no common vital bond, no amount of ecclesiastical patchwork will accomplish the end. It is the organizing power of a supreme life-force that unites men. They are raised to a higher plane of being through the uplifting power of a unifying life-principle. Perfection of the social life, like perfection of the individual life, comes by way of a deeper vitality—of a profounder life-impulse.

And this is Nature's way. Her creations are "made perfect in one." They ascend in the scale of existence in proportion as they are dominated by a profounder and more pervasive life-force. Nature, we are told, begins with "indefinite, incoherent homogeneity." From that she moves on toward "definite, coherent heterogeneity." We think this law of biological progress is a modern discovery. But Jesus understood it when he prayed that his followers might be "made perfect in one." He embodied in the language of life the

principle which science after nineteen centuries has managed to describe in the bald, bare language of technicality. He recognized that the ascent of man is along the pathway of a deeper vitality—of a more pervasive unity. It is then idle to talk of any union that will have spiritual value, unless that union gives expression to some common inspiration—some formative impulse. Unless the Creative Spirit that broods over the doings of men supplies the organizing life-impulse, our efforts will be futile.

I believe there is such a common life-impulse in the Churches we represent. I believe there is between us that kinship in spiritual life that is the true condition for unity. As diverse as we are in historical origin, unlike as we are in ecclesiastical usage and polity, there is a oneness of animating impulse. We have each laid the stress of our emphasis upon the same aspect of the soul's life. Each has discerned and insisted upon spiritual freedom as the first and essential condition of that spiritual life wherein man allies himself with God. Congregationalism had its birth in the effort to realize this truth. It affirmed that the life of faith is possible only when the spirit is free. It discovered that to be loyal to God the soul must throw off allegiance to all other masters. It renounced that subtle form of idolatry that surrenders moral conviction to ecclesiastical authority. It discriminated between the unity of the spirit and the spurious substitute of ecclesiastical uniformity. It stood like a rock for the freedom of the individual conscience and the autonomy of the congregation. It realized that here is the very citadel of the soul's safety. It therefore insisted upon the right and the duty of every soul to preserve the integrity of its spiritual life. Only in so doing can it demonstrate its allegiance to God.

Similarly, the Methodist Protestant Church had its origin in a protest against the inroads of ecclesiasticism upon the life of the soul. The Methodist Protestant Church was the outgrowth of a demand for a more democratic form of government in the Methodist Episcopal Church. This demand was met with repressive measures and persecution. Those who advocated reform were driven to defend their right to hold convictions not sanctioned by ecclesiastical authority. Some of them were expelled from the mother Church for maintaining this right, and with their friends who followed them, they united to frame a Church polity, in which the foundation stone should be the preservation of the rights of the individual conscience. The same principle that brought the Pilgrim Fathers to Plymouth Rock guided the men who fashioned the polity of the Methodist Protestant Church.

And essentially the same spirit animates the United Brethren Church. All three organizations are built upon the foundation of ecclesiastical democracy. They have all recognized that, to preserve its inward allegiance to God, the individual soul must keep free from all entangling alliances without. They have put this truth in the supreme place, because the very life of the soul depends upon it. They have subordinated the outward visible Church to that invisible Church which God's Spirit builds up in the hearts of his children. They have affirmed that the visible Church ceases to have a claim upon the regard of men when it substitutes ecclesiastical authority for moral conviction. When men are dominated by an outward authority in which they have no voice, then fear drives the life of God from the heart. Whenever the Church—or the State—ceases to recognize that its existence, and its sole authority, is derived from the unfettered moral conviction of the free spirits that compose it, then it ceases to foster the life of God in the soul. That is why democracy, both civil and ecclesiastical, is the very air of the soul's life. That is why the Churches we represent have laid their emphasis upon this truth. They have recognized that if God's Spirit dwells in man, then manhood becomes sacred. If God takes man into his family and fellowship then man should bow down to no other master. If God condescends to reveal himself in the human soul—if he imparts to man a life wherein his Spirit witnesses with our spirits that we are the children of God—then human life takes to itself new dignity and value. God himself puts the crown of self-respecting manhood upon the human brow—and the soul that abdicates its sovereignity is lost.

Now because the Churches we represent have alike discerned this truth, there is between us a kinship of spiritual life. As far as it goes it is a good foundation on which to establish a closer fellowship. But this alone, I think, will not knit us into organic oneness. If a true union takes place it must arise from the call of a new and deeper life-impulse. It will be the outgrowth of a new and present need in the evolution of the great gospel force set in motion by Jesus Christ.

For nineteen centuries the Gospel has been working out in human society those conditions that differentiate men. It has taken nearly two thousand years for the impulse of spiritual liberty to work itself out into human society. At last in the best civilization of to-day, and preeminently in the ecclesiastical environment which the Pilgrim Fathers created, we have reached the conditions in which individualism finds its perfect flower.

Has not the psychological moment come when the counter process of integration should come to the front? Has not the time arrived when an ecclesiastical organism shall be born that—while preserving the sanctity of individual life—will yet fuse the many into oneness of purpose and effort? The social ideal of the Gospel is a connectionalism that fosters individualism.

You Congregationalists have led the van in realizing the conditions that make men—that perfect the individual. You have pioneered the way from the barrens of ecclesiastical homogeneity to the fruitful fields of spiritual heterogeneity. Will you not now guide us to a heterogeneity that "coheres"?

"Oh!" but you reply, "there is no connectional organism yet devised—no ecclesiastical habitation yet constructed—that is worthy of God's freemen."

Well, then—make one. I believe you can do it. We Methodist Protestants will move into it with you.

The world is waiting for that spiritual evolution in the visible Church wherein God's freemen shall be "made perfect in one." I do not know just what it will be. Perhaps it may be realized through a representative democracy whose conclusions reached through deliberative assembly become law only when ratified by autonomous Churches—a sort of referendum. But whatever it may be the times call for it.

I think I see the signs among you Congregationalists that God is calling you in this direction. I see prophetic and portentous stirrings among you. Only last Saturday I had the privilege of meeting with the college presidents who are in attendance at this Council. The necessity of a more efficient co-operation, of a closer connectionalism, among Congregationalists was the keynote of that meeting.

Brethren, I tell you organization is consistent with spiritual liberty. The problem can be solved. A hierarchy is not the only method of securing ecclesiastical co-operation and efficiency. A living man is more efficient than an automaton. Should not a living Church be more efficient than a hierarchy? During this Council I have heard some expressions of admiration for the splendid achievements of some of those Churches that can marshal their forces into line through ecclesiastical authority. Do we believe that the ranks of God's army will move with any less steady tramp, or less effective force when linked together in the unity of the Spirit and the bonds of peace?

I believe the era of spiritual integration is at hand. The visible Church must organize itself on those lines that will realize the deeper unity of the Spirit. It must move toward those conditions that secure efficiency of co-operation as well as the perfection of the individual. It must focus the spiritual forces of the Church, so that they converge to a common end and definite purpose.

If these three Churches which we represent here to-day—and any others that choose to come with us—can join hands on some such basis, I believe the dawn of a new day will break on the world. It seems to me that we are peculiarly fitted to unite in an aggressive evangelism. Not only the things which we have in common, but our very differences supplement each other for such a work.

You Congregationalists have developed a distinctive type. The conscious possession of spiritual freedom has developed the sense of responsibility. The sense of responsibility, in turn, has steadied judgment and given poise to the in-

tellectual life. Clear insight and strong conviction logicaly follow from that spiritual life that cherishes its freedom as its most precious heritage. There is nothing that clarifies the mind like the sense of responsibility. This equipoise of judgment and clearness of moral view has marked Congregationalism with a sanity which we of other Churches have learned to respect.

But we Methodist Protestants and United Brethren would also bring our offering to the common life. We each owe our origin to the great evangelistic upheaval in the latter part of the eighteenth century. Our Churches were born in a spiritual revival. We have inherited a regard for religion, as a spiritual experience. The Methodist awakening under the Wesleys was a revulsion from the formal and speculative tendencies of religion to the facts of the spiritual life. It laid the stress of religion upon verifiable experiences of the spiritual life. It carried realism into religion. It did for spiritual life what Francis Bacon did for material knowledge. It directed attention from speculations to facts. It carried the spirit of the modern learning into the field of religion. It did this in a crude and naïve way, it is true. It was uncritical and unreflective, yet it gave new power to religion by directing attention to the facts of regenerated life. It injected a freshness and vigor into the spiritual life of which the world was then sadly in need.

Now, I think we would bring something of this inheritance with us. To your clearness of view—your sanity of judgment—we would add the fervor of assurance, the zeal of conviction. We Methodists have made a discovery. It is a secret; but I will tell you. *The world is to be saved by passion.* Broad-minded tolerance alone will not do it. It is passionate love for the truth that saves men and unites them, and dissolves all minor differences.

Now, what is more needed to-day to give the Gospel effectiveness than an alliance of sanity with enthusiasm? What will more quickly bring to Christianity its early power? An overpowering sense of the realities of the spiritual life on the one hand, and an interpretation of these realities in the light of clear insight and well-poised judgment on the other, will give religion a new power over men. It is simply the truth to state that the traditional forms of religion have weakened their hold upon men. There is need of a new evangelism. Men need to realize that the universe of unseen life is as truly within the grasp of man's experience as the outward world of sense. Eternal life must be presented to men as a possession that is both real and rational. The new evangelism which will bring this life closer to men will preach the Gospel with knowledge and with zeal; with sanity and with enthusiasm; with light and with life.

I believe that a spiritual renaissance is at hand. I believe we are just entering an era when the spiritual world shall be revealed in new power. We shall approach this whole subject in the spirit of rational realism. We shall preach the Gospel with the power of a heaven-born enthusiasm, illuminated with the light of a sanctified reason. We shall bring consecrated intellect to the higher reason of the soul's life, and do for spiritual realities what science has done for the world of nature.

The religion of the twentieth century will necessarily be one that has a strong grip on human experience. It must be grounded in the facts of human life. What will save the world to-day is not tradition, not dogma, not religious ceremonial, but a religion growing out of the deepest facts of man's spiritual life. Men have become bewildered amid speculations, and traditions, and forms. They can find safety only in a vital religious experience. The vitalities of religion are eternal, and they will survive the forms. The verities of religion will outlast the speculations of men. Ecclesiasticisms, and traditions, and forms may pass away. The critical spirit of to-day will sift out from the claims of religion all that cannot anchor itself in the indisputable facts of the spiritual life. If we will catch the ear of this busy materialistic age, it will be because we can convince men that their present life touches the supernatural as well as the world of nature. It will be because we can convince them that there is an open thoroughfare between the soul and the unseen. This is the only foundation that the religion of to-day can build upon with safety. A present revelation of God

in the fact of regenerated life is all that will restore to religion its early power. We must be able to say with the apostle, "Hereby we know that he abideth in us, by the Spirit which he hath given us." If I touch an electric wire and receive a shock do I not know it? If the ravishing harmonies of the organ break in upon my ear, do I not know it? If I open my heart toward God, and a wave of love and life sweeps into my soul, do I not know it? An invading energy of personal life is just as direct an evidence of the environment of unseen life as an impression upon the senses is of our material environment. The evangelism that will present the Gospel with the realism of conviction and the illumination of insight will reach men with an irresistible power.

This is the propaganda to which I conceive we are called. A fresh consciousness of the nearness of the Unseen interpreted by sane judgment is the demand of the hour. If we do not heed the call others will. God's purpose will not be thwarted. The world must be saved—saved from materialism—saved from selfishness—saved from perversity. A great opportunity lies before us. It remains with you—it remains with us—to determine what the issue shall be.

The Hopi Snake Dance

BY THE REV. CHARLES M. SHELDON

Author of "In His Steps," Etc.

IT is the twenty-third day of August, in the year of our Lord, 1904. But as we sit on the edge of a kiva in the Hopi village of Oraibi looking into the public square, in which the Antelope and Snake priests are chanting their unpronounceable invocation, it might as well be the time of any heathen god hundreds of years before Christ, so far as the spectacle itself is concerned and the weird emotions it stirs in the breast of the white brother who sees it.

In some respects the Hopi Snake Dance, which occurs every two years at Oraibi, is the most unique sight on this continent. And there were circumstances

The Kiva from Which the Author's Observations Were Made

Talavenka and Schewingoische

connected with the ceremony this year which to those behind the scenes added an intense pathos and interest to it, never felt before by any of the comparatively few white people who have been present during the last twenty years.

It lacks an hour of sunset. Practically the entire population, some eight hundred souls, are present on the tops of the houses or seated or standing around the square where the dance is to be held. Add about fifty tourists from Boston, Cleveland, New York, a class in anthropology from Harvard, a group of Navajos on horseback, a sprinkling of traders, Government teachers, and cowboys; in all perhaps nine hundred people awaiting in various degrees of anticipation the emergence of the priests from the underground rooms where the ceremonial rites are practiced.

The little children are running about. Some of them are entirely destitute of clothing, and one boy drifts across the plaza dressed in a flour sack, which has a slit in the bottom through which his head is thrust. On the back of the sack are the words, in bright red letters, "Crosby Mills, Topeka, Kansas."

The spectators are quiet for the most part. The man with the moving picture machine stationed on the top of a house at the right is making some changes in his position. The newspaper correspondents get down as near to the circle marked on the sand as they think the Indian police will permit.

About twenty feet at the left and rear of our kiva, without announcement, the Antelope priests suddenly emerge on their ladder. There are twelve of them, mostly old men. The last one, however, is a lad not over twelve years old.

They march quickly down past the circle of tourists, and, keeping up the incessant moving of their rattles, go down into the plaza past the little cottonwood booth in which are the snakes, and

stamping each in turn on the board in front of the booth they turn and line up facing the east.

Then with the same absorbed, unconscious feeling toward their surroundings, the Snake priests come out of their kiva and quickly glide one behind the other down into the square and line up, thirteen in number, facing the Antelope priests and looking toward the setting sun.

A Group of Hopi Girls

The whole spectacle is at this point unapproachable by any description, picture or view. Color and atmosphere and natural setting are unmatched on the globe. The two lines of priests sway back and forth, up and down. The chant begins, a low deep guttural, which vibrates along a white man's spine as if each separate bone were rubbed with rosin and each bone had a separate fiddle bow drawn over it.

For twenty minutes the chant and the swaying continue. Then the line of Snake priests moves around past the little booth, and each as he stoops receives a snake from the inside of the booth. These snakes are not all venomous. There are some thirty in all. One large bull snake falls to the lot of the lad who is training as a novitiate with the Antelope priests. Its tail drags on the ground as the boy seizes the snake firmly with both hands and holds its neck between his teeth.

Out of the thirty snakes used, at least two-thirds are big rattlesnakes. They have been caught and treated to several ceremonial rites for days before their public appearance, handled with apparent carelessness and without extracting their fangs or so far as any knowledge goes, without being in any way deprived of their venomous character.

Each priest of the twenty-five now has a snake, holding it in the mouth with the head close by the cheek, and grasping the reptile with both hands, so that its body is in nearly a straight line down the front.

Each priest in turn throws his snake down on the sand, and, letting it run away, catches it up again with a quick motion. One of the biggest rattlers is too quick for one of the priests and wriggles swiftly across the circle into a little group of tourists. There is a scream, a backward rush, a yell of delight from cowboys and Navajos, and the snake is at last captured and brought back. Meanwhile cameras snap, and the moving picture man has a spasm as something goes wrong with his machine at a time when a camera cannot be pointed

in any given direction without the possibility of a picture that will be unlike anything in the wide world for interest or artistic effect.

Suddenly, close by our kiva, the Indian police push back the tourists and newspaper men. An opening in the circle of spectators is made, and down into this opening come rushing a group of women and girls bringing the sacred corn meal. They sprinkle it on the sand in a little heap. The priests rush up to the spot and throw the snakes down on the meal in a confused wriggling twisted heap. Then without any care to avoid possible bites from this venomous heap of poison, each of the twenty-five Hopis dives down upon the mass and grabs ("grabs" is the only word to use) as many snakes as he can get and runs down off the gray rock out into the desert to let the snakes go to send their prayer for rain to the god that sends rain on the desert once or twice a year.

The vivid groups on the tops of the houses scatter here and there. Waiting the return of the priests to drink the ceremonial liquor at the snake kiva, the town crier of Oraibi mounts a roof and announces a preaching service that evening in the Mennonite Church on the edge of the rock. The children race across the plaza when the dance has been held. The tourists flock over to the snake kiva and in the twilight await the close of the dance.

One by one the priests come up over the edge of the rock panting and sweating from their long run off the mesa and back. The lad with the Antelope priests seems almost ready to drop with fatigue and the long fast which has preceded this day. All the priests go down into the kiva and wash off the ceremonial paint. They come out in a few minutes and kneeling down drink large quantities of liquor from great jars set down by the women close by the kiva opening. And then, with tourists and Navajos and traders and cowboys looking on silently, with the great gray rock on which is perched the three-story houses of a tribe of people that date their ancestry back to prehistoric times illuminated with the soft warm light of the painted desert reflection, these grave faced priests vomit

Hopi Indians at Oraibi Mesa

around the kiva, kneeling and lying down in various degrees of discomfort, and altho the same sight in a group of white men would excite derision, the Hopi maintains his dignity even here, for is it not all a part of his religious ceremonial life, with no reference whatever to any idea of an antidote for poison, for the snakes do not bite or strike the priests at any time?

Darkness settles on the rock fast as we make our way to the little church for the service announced by the town crier. The service begins and the backless wooden benches are crowded with a mixed audience of native Hopis, Government teachers, a few white visitors, and on the front row two young Hopi maidens dressed like any American girls of good Christian nurture, named respectively Talavenka and Schewingoiasche. These two maidens have made the Oraibi Snake Dance in the year of our Lord 1904 memorable, for it is the first time in hundreds, perhaps even thousands, of years that a Christian Hopi has stood on the top of a Hopi house and witnessed out of eyes that now see the vision of the cross, a spectacle that has degraded her own people for centuries with a superstition that to the sentimentalist ought to be preserved for anthropological reasons, but to the Christian ought to pass out of the lives of a people of great natural poetic and imaginative power.

Looking into the calm faces of these Hopi girls, the only Christian girls in the whole village of Oraibi, one sees them again as the Snake Dance is at its hight. There they stand on the top of their father's house, the glad tragedy of their isolation from their own people strong

Snake Booth and Circle

upon them, the tears raining down their faces, as the guttural chant, the rattle of the Antelope priests, and the hollow thump of the board, in turn roll up out of the square, the first time in the history of this unique people, less than two thousand in all, that one of their own race has looked upon its superstitious rituals with the eye of pity or heart longing for a better day for a tribe that on the gray rock in the painted desert consumes its daily life away in a traditionary imitation of secret rituals where the one persistent cry is for rain, rain, rain.

Will the readers of THE INDEPENDENT

Snake Priests in Circle

who believe in the light that lighteth every man coming into the world breathe a prayer for Talavenka and Schewingoiasche as they stand alone on the gray rock pile of Oraibi, their earnest souls looking off to the east for a sunrise on the mesa that shall mean for their people the rising of a new and better day?

Snake and Antelope Priests Ceremonially Facing One Another

Literature

Shelburne Essays

It has been a long time since we saw a volume of literary criticism of any account. The last we remember was Mr. Brownell's "Victorian Prose Masters," which appeared nearly three years ago, and a little before that Mr. Santayana's "Poetry and Religion." And now at length, after such a tedious interval, when we had nearly given up hope, comes this volume of *Shelburne Essays,** by Mr. More. With his two predecessors Mr. More offers little or no resemblance, save that he, too, has "sucked the marrow of lions and been dipped in the Styx," as is evident from his first essay, "A Hermit's Notes on Thoreau," in which he explains the *rationale* of his rather fanciful title. There is a little village of this name, so he tells us, among the New Hampshire hills, where he lived for several years the life of a recluse and by losing found himself. And in explaining in this manner his title he has at the same time explained his book. It is first and foremost the work of a man who has begun by reckoning with literature and life and in so doing has come to himself. In fact, we do not know of any one now writing who gives evidence of a better critical equipment than Mr. More. His range of subject is wide—Hawthorne, Poe, Symons, Yeats, Tolstoy—but these are obviously only the summits, the temporary observatories of his thought, and below them lies a continent of literary study and exploration.

PAUL E. MORE.
Author of "Shelburne Essays"

Our readers are already familiar with Mr. More's work, for much of it, including some of the essays in this volume, has appeared in The Independent. It is indeed very rare nowadays, when a knowledge of a single language and a shelf-full of translations are considered quite sufficient to set an English critic up to business, to find a writer thoroughly familiar with both ancient and modern thought. We would not underrate the personal bent, the innate gift, whose lack no amount of reading can possibly supply; but aside from such an incalculable factor it is this width of view, this intimate acquaintance with so much of the best that has been thought and said in the world, irrespective of local or temporary prejudices and aberrations, which constitutes Mr. More's strength as a critic. In this way he has been able to form for himself a sound literary canon and a sane philosophy of life, which as a standard of values afford the only safe and legitimate substitute for those mechanical systems on the one hand and those loose vaporings on the other which have of late years done so much to stultify and vulgarize literature. Of this marriage of a sound literary canon and a sane philosophy of life, which is to our mind his peculiar merit, the essay on Arthur Symons's poetry affords perhaps the best example. The subject may not be worth all the pains;

* Shelburne Essays. *First Series. By Paul Elmer More.* New York: G. P. Putnam's Sons.

it is a little incongruous with its surroundings; but the analysis is a remarkably shrewd and penetrating piece of work, so much so, in fact, that it has almost the appearance of an *à priori* construction and, true as it is, seems very like a *tour de force*.

To be sure, Mr. More's volume is not faultless. What book is? To some extent his mind is still ridden, it would appear, by certain general ideas. There is no reason, of course, that a critic should not have his ideas, provided they do not impair the elasticity of his appreciation; but it is not well that in the face of facts he should be dominated by them. And in some degree Mr. More's mind does seem dominated, for instance, by the philosophy of India. Under such influence his exposition is occasionally comparative when it might better, one would think, be derivative. So in his essay on Carlyle, he insists upon this Hindu sense of illusion as forming one of the two constituents of Carlyle's thought—"altho of direct influence from India there is, of course, no suggestion intended"—and in consequence the long parallel which he draws, illuminative as it is in itself, is only an analogy and not an explanation of Carlyle's literary being. It is just this yielding to the lead of a predominant idea which gives him now and then an unfortunate air of rummaging, and which might, we should fear, if unduly indulged in, impair that caressing flexibility of thought which we have already admired in the essay on Arthur Symons as adapting itself so exquisitely to the sinuosities of its subject. But just at present, in these flickering and vacillating times, what is so particularly steadying and healthful about Mr. More's work is its rational "absolutism," its conviction that there are certain things of enduring and permanent value for the human spirit and its endeavor to separate them from the unstable chaff and hold them up to steady contemplation and admiration.

It is not clear that the enduring and the permanent is to be sought through Sanskrit religion or Hindu philosophy rather than in the lessons of Western ethics or insight, which look quite as deep as all the mysticism of the East.

Reddaway's Frederick the Great

LIKE all representative historical characters who have built up states or inaugurated national policies, Frederick II has assumed very different moral attitudes in the eyes of successive generations. During the greater part of the last century he was the "crowned sophist," the "false Julian of a false Athens," or the suspicious, scornful tyrant of de Maistre and Macaulay. To-day he seems to be regarded in the Empire which is the result of forces that certainly found no place in his political system as the embodiment of all the finest qualities of his race, the real pioneer of a solid and triumphant Germany.

That part of the Hohenzollern legend which portrays Frederick as the architect of the modern German Empire finds little support in this study of the Prussian hero. But, altho the author has none of the fanatical admiration for Frederick of writers like Carlyle, he is, on the whole, rather favorable to him, and his appreciation of the King's complex and singular nature appears to be fair and equitable. That considerations of right and wrong had, indeed, no influence on the King's policy is proved by most of the incidents in his career. "If there is anything to gain by being honest, let us be honest; if it is necessary to deceive, let us deceive," are his own words. But many a statesman has taken the same view of international ethics. "If we did for ourselves what we have done for our country," exclaimed Cavour, "what rascals we would be!" Frederick's single-hearted devotion to his duty as a King and Hohenzollern as he saw it, and his conception of the part a real king ought to play, his vigilance and energy, and the invincible firmness of his resistance amid crushing disasters do much to make Germans at least forget the perfidy of his diplomacy, the brigandage of his wars and the conscious or unconscious immorality of his policy.

Mr. Reddaway's style is perhaps somewhat lacking in warmth and color, but it is clear, vigorous and elegant. He has made an admirable choice of de-

* FREDERICK THE GREAT AND THE RISE OF PRUSSIA. *By W. F. Reddaway.* New York: G. P. Putnam's Sons. $1.35.

tails, is evidently saturated with the literature of his subject, and is thoroughly familiar with Carlyle's enormous and undigested mass of documents. Perhaps the most interesting chapter in the book is that dealing with Frederick as Crown Prince. His intimacy with the unfortunate Hermann von Katte, his attempt to escape, his betrayal by a page, the wrath of Frederick William, the arrest of the Prince Royal and his confidant, the trial of the prisoners, the execution of Katte at Küstrin under the windows of Frederick, are all related with striking simplicity; we have a faithful narrative of a dramatic episode upon which many absurd legends have been founded. The author, however, omits to state that Grumbkow, Frederick's confidant and jailer, was all the time the spy of the Emperor Charles VI. Grumbkow's letters to the Austrian Minister Seckendorf, since discovered in the archives of Vienna, place the matter beyond doubt. The impression Mr. Reddaway's picture leaves on the reader is that Frederick's genius was the product of two opposite forces, the Hohenzollern nature and the culture of the eighteenth century, the spirit of his race and the spirit of his age. The first supplied him with the marvelous energy which prompted him to take on his own shoulders all the burden of the state in war and peace, and to put forth all his strength at every blow; the second made him the pattern of the monarchs of his day and generation, the type of the benevolent despots of the later eighteenth century.

Human Work

In her book, *Human Work*,* Charlotte Perkins Gilman has undertaken the no trivial task of codifying and stating economically the universal philosophy of the poets and the prophets since discussions of life and work began. John Ruskin wrote some essays on the subject which were thrown aside by the economists as being merely literature. Mrs. Gilman has gone in to fight the economists on their own ground. Indeed, she denies that it is their ground and boldly announces it her own. She questions the title at every step with her clear, almost childlike innocence of scholastic convention; she regards their assumptions as unwarrant-

* Human Work. By Charlotte Perkins Gilman. New York: McClure, Phillips & Co. $1.50.

able, and turns out the whole respectable crew bag and baggage, fumigates their lecture rooms and universities, and installs there the poets instead; these shall be the lawgivers hereafter and this first book shall be the tabulated prospectus. In fact, she treats the orthodox science of economics as she treated the "Obstacle" in her well-known poem of that name—she walks right through it as tho it were not there.

It is with no sluggish interest that the reader follows the plan and the argument. The old conception of society as an organism is taken as the working hypothesis. Analogies are drawn on every page. The social soul and the social body are discussed; the social conscience is the criterion of wrongdoing, the social welfare is the end of all action.

With this point of view the problems of the individual all change, they Christianize and are removed from the world of business. Man is no longer an enemy of man, each one struggling with the others. His work is not to keep himself from starving, but to add to the world's work his portion. A small amount will feed his mouth, as Mrs. Gilman shows, provided that he can rely upon the world stores in time of his old age or his illness. Work then becomes ennobled; it is king; it is the highest form of the expression of the individual.

Mrs. Gilman points out what she calls the seven "root errors" in the postulates of political economy. Of these the Ego Concept is the first, and it is denied that we work for ourselves with pithy and amusing illustration. The second is in the association of pleasure with impression or things that we get, whereas, as a matter of fact, it depends more largely on the things that we do. Derived from this is the error of the pay concept and the false system of rewards and of merits which denies the good old time adage that virtue, like work, is its own reward, provided the virtue and the work come from the heart, instead of being enforced on us by others. Following this is the fallacy of the want theory, the basic proposition of economics, the theory that we work only to supply our individual wants, instead of the wants of the race, and the pleasure of success and of effort. On this point are some of the brilliant arguments of the book, developed in the later coming chapters. Every class of society is discussed and defined with the characteristic clearness of the writer; if the old time whipping satire is omitted, her kindly inquiries are hardly less confusing. The idle rich, the idle poor, the overworked, the slaves and the slave drivers, and the free men, each in turn are told new things about themselves by these searching questions and these merciless observations. The latter half of the book is far superior to the first, for while the author takes her pride in her reasoning, she is more admirable in her intuitions. While everybody will, of course, take exception to that part where his own pet theory is questioned, at the same time he will rejoice to see his enemy put down so handsomely, and even on those theories that are his pets—well, he acknowledges that the book has set him thinking. Mrs. Gilman's work will not be taken as seriously as she obviously intends it should, for her style of argumentation permits the use of arms not recognized as legitimate. Theories based on a large body of patiently collected and verified data are not to be overthrown by witty jest and a sharp thrust at their advocates. The book is full of very startling assertions, but when the reader drops his eyes to the foot of the page in search of a note giving the evidence for them he finds none. Mrs. Gilman will be followed in all her movements only by those who possess her ability to skate easily over thin ice.

A Handbook of Biblical Difficulties, or Reasonable Solutions of Perplexing Things in Sacred Scriptures. By Rev. Robert Tuck. New York: Funk & Wagnalls Co. $1.75.

We have not seen a book of this character for some years, but there may be still a demand for such ready reference apologetics. The author quotes scriptural passages which have given rise to objections on ethical, theological, scientific and common sense grounds, states the difficulty in the form of a question and then "explains it away" by a somewhat rabbinical style of exegesis. The methods he uses in cases of emergency would be suspected of tending toward rationalism or even higher criticism in any author less unimpeachably orthodox.

The case of Jonah need no longer confound the faithful, for Mr. Tuck tells us that properly translated from the original tongues it reads:

"'Now the Lord had prepared a great barge (fish) to remove (swallow) Jonah, and Jonah was in the hold (belly) of the barge (fish) three days and three nights.' It appears that the ship in which Jonah embarked was bound to the port of Tarshish, and the mariners, having put Jonah in the boat, attempted to pull him ashore, but the sea being tempestuous, they could not. Finding it impossible to land him, they then returned to the ship, leaving Jonah in the boat at the mercy of the waves; in which perilous situation he was three days and three nights."

No higher critic could excise an objectionable passage with more neatness and dispatch than the Rev. Tuck in the case of Matthew xxvii, 52:

"'And the tombs were opened, and many bodies of the saints that had fallen asleep were raised; and coming forth out of the tombs after His resurrection they entered into the holy city, and appeared to many.'

"In view of all that can be urged in favor of, and helpful to, an explanation of this passage, we deeply feel that it is in every way wiser, safer and more honoring to God's Word, to think it is a stranger, and has no business there."

Any one who wishes to have his "difficulties" removed by this painless process without the use of gas is recommended to buy the book.

New Hampshire. An Epitome of Popular Government. By Frank B. Sanborn. Boston: Houghton, Mifflin & Co. $1.10.

In this latest addition to the American Commonwealths Series Mr. Sanborn has given us in the compact form of one small volume the stirring story of the state whose name the book bears. He has the advantage over his predecessors in the same field in that documents and archives are now available, which in their time were hidden, yet, as he frankly confesses, clouds of doubt still obscure the earliest settlements and explorations. Captain John Mason, Governor of Portsmouth, England, laid the permanent foundations of New Hampshire's Settlement, tho, as the author says, it is doubtful whether Mason ever saw the beautiful slice of Maine that King Charles I granted to him, and which he renamed. Mason invested much money which never returned, and started his colony off as a Royalist and Church of England scion, and it had a very uncomfortable time with the dour and masterful Puritans of Massachusetts on one side and the bloodthirsty Indian-French on the other.

A Parody Anthology. Collected by Carolyn Wells. New York: Charles Scribner's Sons. $1.25.

Miss Wells made such a hit with her "Nonsense Anthology" that she follows it now with another amusing book full of crimes of *lèse-poésie*. Among the best, or the worst, according to the development of one's literary conscience, is the author's own imitation of Rossetti:

"The blessed Poster Girl leaned out
From a pinky-purple heaven.
One eye was red and one was green:
Her bang was cut uneven;
She had three fingers on her hand
And the hairs on her head were seven."

That poets do not always object to parodies is proved by Swinburne's parody on himself, "Nephelidia":

"From the depth of the dreamy decline of the dawn through a notable nimbus of nebulous moonshine,
Pallid and pink as the palm of the flag flower that flickers with fear of the flies as they float,
Are the looks of our lovers that lustrously lean from a marvel of mystic miraculous moonshine,
These that we feel in the b'ood of our blushes that thicken and threaten with throbs through the throat?"

Our Mountain Garden. By Mrs. Theodore Thomas. New York: The Macmillan Co. $1.50.

Mr. and Mrs. Theodore Thomas bought a tract of wild, uncultivated land, about twenty-five acres in extent, on the southern slope of a New Hampshire mountain. They built a home and laid out a garden by degrees. Here are the stages by which both, especially the garden, were brought to a state of perfection almost meriting the name of a paradise. The volume is one of those books which are indicative of that strong love of nature which is striking so deeply into the hearts of the American people. Al-

tho essentially practical, it abounds in the charm of esthetic taste, and is a good example of what can be achieved, even under apparently adverse circumstances, by one who, observing nature's methods, is content to learn from them and follow them. A special feature is the absence of lavish expenditure in labor, material or appliances. It is a real garden-lover's book.

The Better New York. By Dr. Wm. H. Tolman and Charles Hemstreet. New York: The Baker & Taylor Co. $2.00.

For so many years bill-boards and subscription-book agents have carried the legend: "The Shady Side of the Great

Wadleigh High School. From Tolman's "The Better New York." The Baker & Taylor Co., N. Y.

Metropolis"; or, "The Darker New York," exploiting all of the existing evils and not a few purely imaginary ones, that it is with a sense of relief that we turn to a Guide Book devoted to the higher life of that complex city. That a "Better New York" does exist no one can question after reading 306 pages devoted to the briefest possible sketches of "the many-handed philanthropies," as various as are human needs. Dr. Josiah Strong in an afterword remarks that the city's ignorance of itself is responsible for not a little of its pessimism; the best possible cure for both is a careful study of all that the versatile ingenuity of the spirit of helpfulness has done to make "New York one of the best cities in the world." This would be a somewhat startling characterization if it did not follow a succinct description of so many missions, "homes," asylums, hospitals, churches, Christian Associations, schools, colleges, universities, parks, playgrounds, recreation piers, libraries, museums, zoölogical gardens, statues, and in general so much that may be uplifting and ennobling to the children of the city, that surprise is lost in wonder.

A Chicago Princess. By Robert Barr. New York: Frederick Stokes Co. $1.50.

In this story Robert Barr achieves the unique distinction of introducing the young American shrew into fiction; and the type is easily recognized in spite of his humorous exaggerations. She appears in such connections that we infer a certain Englishman will marry and tame her; but either Mr. Barr's or the Englishman's heart fails, and the séance which we look forward to never comes off. The shrew is a rich young Chicago heiress, who insists upon going "king hunting" Her social ambition is to have royalty dine with her on board her father's yacht. In this she is disappointed, but she does box the ears of the Emperor of Korea. Incidentally, she is the perfect product of that system of education often adopted by the wealthy in this country, which consists in allowing the child to do as it pleases until it reaches such an age that it does as it pleases whether permitted or not. She is the American maiden flower of unbridled individualism, and Mr. Barr has made a highly diverting story of her well-known peculiarities.

The Loves of Miss Anne. By S. R. Crockett. New York: Dodd Mead & Co. $1.50.

Mr. Crockett has written of love affairs until he has become a gifted gossip in these matters. He knows that love is the direction any young man's fancy takes when a "Miss Anne" appears upon the scene. With sunlit hair and May morning eyes, she is able to start the

springtide of his romantic emotion even in the dead of winter. And so, to write a new story he has only to shift the scene and the combinations. The charms of his latest novel consists in the Highland background, rather than in the beauty and coquetry of Miss Anne (so many heroines have yellow hair and pretty, wicked ways!), in the renascence of the shepherd lover (it is long since we have had so simple and ingenuous a youth in fiction), and in the idea suggested to the reader of Cupid wandering like a naked little knight errant through the mists of Scotland "spiering" out lovers for Miss Anne. (Still, nothing short of a hard pressed literary imagination could have provided so many in such bleak and adverse circumstances!)

Literary Notes

A CHANCE for the literary aspirant is afforded by T. Fisher Unwin, 11 Paternoster Buildings, London, who offers a prize of $500 for the best novel by any writer who has never had a novel published.

....Funk & Wagnalls received a grand prize for their Standard Dictionary from the Commissioners of the Louisiana Purchase Exposition. A gold medal was also awarded to Laird & Lee, Chicago, for the Webster Standard Dictionary.

....For a small general library, public or private, no better guide can be used in the selection of books than the American Library Association Catalog, as now revised and republished by the Library of Congress. It contains 8,000 names classified according to the Dewey System and annotated. In starting a town library it would be perfectly safe to purchase from this list, for by the system of numbering used a well balanced library of 1,000, 2,000 or 5,000 volumes can be selected.

....It has often been noted that the number of men of genius and marked ability of Hebrew blood in any country is very much larger than would be expected from their proportion of the population. That this is the case in the United States is confirmed by the biographical sketches published in the American Jewish Year Book for the year 5665 (September 20th, 1904, to September 20th, 1905), published by the Jewish Publication Society of America, Philadelphia (80 cents).

....Thomas Y. Crowell & Co., New York, issue in their "Luxembourg Library" a series of classic novels that are well fitted for both public and private libraries. The binding is such that the books lie open on the desk or chair arm without the necessity of holding the covers back by the hand or first breaking the back before they become manageable. The covers are of neat design and in a variety of colors. Each volume has 17 illustrations. They are sold at $1.50. Recent issues are Jane Austen's "Pride and Prejudice," William Ware's "Zenobia," Bulwer-Lytton's "Rienzi," Le Sage's "Gil Blas" and Charles Lever's "Harry Lorrequer."

Pebbles

AN editor is known by the manuscripts he keeps—and the stamps.—*A Cynic's Meditations.*

....Some women utilize the Present in such a way that the Future will not find them without a Past.—*A Cynic's Meditations.*

....A minstrel lately stated that a pug dog has a curl in his tail in order to give fleas a chance to loop the loop.—*Atchison Globe.*

....*First Student:* "When you are married are you going to send your children to Princeton?" *Second Student:* "Either to Princeton or Vassar."—*Vassar Miscellany.*

....*Hoax:* "They say the Sultan of Turkey scares his wives nearly to death." *Joax:* "Yes; I've always heard that he was a harem-scarem sort of fellow."—*Philadelphia Record.*

....An Ideal Man lives in Atchison. When he calls his wife to get up and start the fires he does it in a poetical way, saying: "The sun is peeping over the hills. Beloved, it is Morn."—*Atchison Globe.*

....A RESCUE.—The ship was sinking. Mike jumped overboard, reached the shore in safety, then started to swim back. "Why are you going back?" cried out a survivor. "I've saved myself, now I am going back to save Pat," answered heroic Mike.—*Princeton Tiger.*

....At a dinner recently given in London an American actor proposed the conundrum: "What goes round a button?" After the problem had been given up by the party he gave the answer: "A goat." There was a moment's silence. Finally one of the women spoke up. "Why," she said in a puzzled tone, "I didn't know they ate buttons."—*Harper's Weekly.*

....*Anxious Inquirer:* "Is it true that for fifteen shillings I can insure my house for a thousand pounds?" *Clerk:* "Quite true, madam. If your house burns down we pay you a thousand pounds." *Anxious Inquirer:* "And do you make any inquiries as to how the fire originated?" *Clerk:* "Certainly. We make the most careful inquiries." *Anxious Inquirer:* "Ah! I thought there was a catch somewhere."—*The Spectator.*

Editorials

Questions of the Campaign

THOSE who review carefully and dispassionately the course of the campaign must see that the foremost subjects of discussion and controversy have been the vigorous personality of Mr. Roosevelt; his political tendencies, as seen by friend and foe; certain executive acts for which he was directly responsible; the question of Philippine independence; the present tariff law and its relation to combinations of manufacturers, and the restraint of all monopolistic combinations by the enforcement of existing laws or the enactment of new ones.

No intelligent American questions the personal integrity of either Mr. Roosevelt or Judge Parker. Both have lived blameless lives. But the Judge has for many years had no public relation to politics or questions of government. His personal attitude toward them must now be ascertained and judged by what he has said since his nomination. On the other hand, Mr. Roosevelt has been under public scrutiny for a long time. Judge Parker is honest, democratic and thoroughly American. So is the President. Because the Judge has no record as an executive officer or legislator, predictions as to what he would do or try to do in the Presidential office must be based almost exclusively upon his recent utterances. Mr. Roosevelt has done something. He has done much. What his partisan opponents attack is not so much what he has done as it is the way in which he did it and the motives which they ascribe to him.

In this they have greatly erred. They have built up for partisan uses a fictitious Roosevelt. The President is an energetic and industrious man, whose trained mind, stored with the record of his country's history, and charged with the teachings of experience in executive office, thinks quickly and in straight lines. He is a patriot, in thorough sympathy with American institutions. He does not long to be a despot, to override the law, to usurp the powers which have not been granted to his office. We regret that Judge Parker in his letter of acceptance permitted himself to draw that misleading picture of the ambitious and usurping Executive, "fired with the lust of power." It was unjust, it was absurd, and it was a blunder to ask the people to believe that the election of Roosevelt would give them a Government of "individual caprice" and substitute "beneficent despotism" for popular rule.

It may be unnecessary to add that we have found in Mr. Roosevelt's acts and utterances nothing to support this extraordinary assumption that he has such designs upon the liberties of the American people. We do not undertake to say that he has never erred or that his course in the future will always be beyond criticism. He is human. But this talk about despotism is utter nonsense.

We cannot compare the President's record as an executive officer with Judge Parker's, because the Judge has none, altho his record as a judicial officer has been excellent. We find that Mr. Roosevelt's course in the Presidential office as a whole deserves high praise, altho it is not absolutely without flaw. For example, as we said in November last, after a searching examination, his action with respect to the Panama revolt was marked by undue haste and some inconsistencies in details of procedure. But there has never been shown any proof that he or our Government connived at that revolt. We believe that if the question of approving his attitude toward the South American countries could be submitted by itself to the American people it would have the votes of an enormous majority. The United States must be interested in the shortcomings of those republics whenever these shortcomings or offenses are of such a character that they invite and warrant the interference of European nations. It is a question that involves the Monroe Doctrine and our own peace. Such a friendly warning as was given in Mr. Roosevelt's letter to the Cubans at their banquet does no harm. Where is the evidence that he has ever sought to play the *rôle* of a "continental policeman?" That is another fiction of the campaign.

Mr. Roosevelt is a man of high pur-

pose, devoted to the interests of the people, an earnest advocate of peace and arbitration, in whom, as we believe, there is no thought of selfish intrigue or of a sacrifice of the public welfare for his personal ends. Considering only what may be called the personal issue, we think that of the two candidates he should be preferred, altho there is much in the life and character of Judge Parker for all good Americans to admire.

When the independent voter considers the policies of the two parties he may reasonably ask not only what the party in power has done and what each party promises to do, but also what the Opposition could do if it should elect Judge Parker and with him a Democratic majority in the House. First, as to the currency: Neither party has a spotless record on that question, but we may be sure that the Republican party has learned its lesson and will be true to the gold standard. The education of the Democratic party on this subject is by no means complete. Further legislation in support of the standard is needed. There are indications that it would meet with Democratic opposition. At all events, so far as the currency is concerned, the Republican attitude and purpose are to be preferred. Of course, we do not expect that the Populist and Bryanite element of the Democratic party will ever induce that organization to stand again for silver.

Both parties are committed to the construction of a canal on the Panama route. Altho the Democrats assert that Colombia was robbed and that our dealings on the Isthmus were tainted with unjust connivance and intrigue, they do not undertake to make restitution if they should be successful at the polls. It must be admitted that there is warrant for Mr. Hay's remark that they are willing "to reap the fruit of our infamy." An original slight difference as to Philippine policy has been accentuated and enlarged by Judge Parker's recent addresses. The Republican party would carry on the work of education and development that has been begun, gradually increasing the measure of self-government, but making no promise of coming independence. The Democrats would make such a promise immediately, without fixing a date for the fulfilment of it. We have recently shown for what reasons we think the policy of Mr. Roosevelt and Secretary Taft should be preferred. The legislative capacity of the Filipinos is still to be tested in their first Assembly. For the welfare of the islanders as well as for the good of the United States no promise of independence should be given at this time. There is no despotic imperialism in the relation of the United States to these islands and their inhabitants. Even if it were desirable that the Democratic view should prevail, Judge Parker's election would not cause the change to be made. The Senate would bar the way.

As to the negro citizens of our Southern States, the Democratic policy is that of the Democratic party in the South. Secretary Taft reminds Judge Parker that "a departure there from the consent of the governed is indispensable to Democratic success." It is unnecessary to point out the justice of Mr. Roosevelt's attitude toward our negro citizens. What Judge Parker's attitude is he has not said. Probably it accords with that of his party in the States whose 151 electoral votes are his beyond question.

We now come to the subject of tariff revision and Trust restraint. So far as the Democratic party stands for a just revision and a reasonable reduction of the present duties, it is in the right. The platform doctrine that "all protection is robbery," which involves a resort to absolute free trade, we cannot accept; but the glaring iniquities of the present schedules call loudly for a revision that will remove them. If the Democrats are right in striving for revision and reduction, it follows that in opposing either the Republicans are wrong. If this were the only issue involved in the election the Democratic party would well deserve success, although the voter should not forget that during Judge Parker's term, probably, no change could be made without the consent of a Republican majority in the Senate.

Revision is especially needed with respect to those duties that are abused by great combinations of manufacturers. Competition from abroad having been excluded, these Trusts suppress competition at home, or so restrain it that it almost ceases to exist. Thus they are enabled to compel the payment of high

prices by the people who gave them the duties, while at the same time they sell to foreign buyers at prices lower by from 25 to 40 per cent. The legislative props that hold up the high domestic prices which pay dividends on watered stock should be withdrawn.

There is no promise that the Republican party will withdraw them. By the party's leaders (by Secretary Shaw, for example), both the high prices at home and the sales at lower prices abroad are defended. We confess that a revision made under the direction of Senator Gorman, ex-Senator Davis, Mr. Hill and the members of the Democratic Executive Committee might not be wholly in the interests of reform, but, on the whole, the Democratic attitude toward the tariff is better than that of the "stand-patters."

It is difficult to say which of the two parties has the better policy for such restraint or regulation of Trusts as may be accomplished outside of the tariff. The Republican party is to be credited with the laws we have and with most of the attempts to enforce them. These attempts, however, have had little effect in overcoming the evils at which the legislation was aimed. The same party promises to continue to enforce the laws, altho the work has for some time been suspended. Judge Parker, while relying upon the common law, by means of which the Federal Government could do nothing, also promises to enforce the statutes. His party's platform calls for a thorough enforcement of these, a grant of larger power to the Interstate Commerce Commission (which ought to be given), and legislation withdrawing the privileges of interstate transportation from Trusts of manufacturers guilty of certain specified offenses.

A thorough enforcement of the Sherman Act would disintegrate many a railway system, if the Supreme Court should sanction this, which is doubtful. We see nothing to be gained by such action. The law was not passed for such a purpose. The proposed exaction of a transportation penalty might be injurious, inexpedient, or impracticable. Within the last few years new and unforeseen conditions have appeared in the industrial world, and we are not prepared to deal with them. The subject is one of high importance, and it demands the careful study of competent men. It is clear, however, that favors should not be granted by legislation to greedy monopolistic combinations at the expense of the public, and that such combinations ought to be under Federal supervision.

When we look at the broad field of our international relations, it is plain that these have been in good hands during the last few years, so far as executive and diplomatic action is concerned. In a commercial sense they have not been wholly satisfactory, but this is the fault of the Senate. Our reciprocity failures must be charged to the Republican members of that body. In other respects, however, the American nation has taken its rightful place in the world, and much credit for this must be given to Mr. Roosevelt and Mr. Hay. What they have accomplished in this field for their country excites the praise and admiration of American patriots.

The record which we have briefly reviewed is not wholly one-sided, but in our opinion Mr. Roosevelt deserves a vote of confidence, and the interests of the United States and its people will be much better served by his election than by his defeat.

The Victory of The Hague Tribunal

EUROPE follows America in its call to The Hague Tribunal, and this is by far the most important reference as yet to that court. Indeed, a more important case can hardly be imagined. All Europe was involved in the difference between Russia and Great Britain, even as all Europe is geographically embraced between the two extremes of its territory. It was a case of war very imminent, and just averted by the agreement to leave to investigation by an impartial tribunal the facts as to which there was disagreement.

For it is only the facts that are to be decided, but that makes no difference as to the gravity of the case, for it was the facts that are just now in dispute; the apology, or reparation, will come later. Russia defends her attack on the peaceful fishing fleet on the claim that

her fleet had been first attacked by two —and one captain says half a dozen— Japanese torpedo boats, which actually fired shot at them. On the other hand, the British Government declares that there was no Japanese torpedo boat whatever in those waters, and that the Russian Admiral and captains were so ignorant, or so excited, or so drunk—or all put together—that they could not tell a fishing boat from a torpedo boat, and could not distinguish a rocket from a cannon shot. Fortunately, the difference is one of fact, and the fact can be positively settled. If there were two torpedo boats on the banks they can be found, or the one of them that was not sunk. We agree with all the rest of the world, and with the positive assertion of the Japanese Government, that there were not two nor was there one gunboat there, and that it was maudlin terror, backed by reckless orders received at St. Petersburg to attack anything suspicious on sight, that is accountable for the blunder. Not only these British trawlers were attacked, but German and Norwegian fishermen also report that they were fired at, altho, fortunately, no one was killed. The fact will be easily proved that there were no torpedo boats there, except Russian, and it will follow that Russia will, without further humiliation, punish the blundering officers. The immediate crisis is past; there is time for reflection and cool decision, and no war between Great Britain and Russia will follow.

How happy it is that there was a Hague Tribunal to which the case might be referred; and how happy it is that there was found in the treaty of The Hague just the provision required, one that avoided questions of honor and action, and embraced questions simply of fact on which two Governments might differ! Russia might be unwilling to leave it to the tribunal whether she should punish her Admiral, but she felt no humiliation in leaving it to be settled whether or not her fleet had been attacked by hostile torpedo boats. The establishment of this tribunal by the conference at The Hague is thus magnificently justified. This reference to it will be one of the great events of the whole century. Nothing else could do so much to put an end to wars. Other references to it of disputes have had comparatively little significance, important as they were, but this case will be a precedent of untold value and will compel similar action in the future. Those American publicists to whom we are indebted for urging and inducing the unwilling member of The Hague Conference to accept the tribunal of arbitration, as well as those who had for some years previously been developing the plan, may rejoice at this supreme success. We can conceive the delight of Andrew D. White; and we deeply regret that Mr. Holls is not living to taste this fruit of his earnest labors. For while other cases referred to The Hague, such as the Pious Fund, between the United States and Mexico, and the Venezuela claims, introduced The Hague Tribunal to the diplomacy of the world, this is the first case in which imminent threatened war between two first-class Powers has been averted by its intervention.

We must not fail to recognize the good will of both the Russian and the British Governments in preferring the means of peace to the event of war. Nor must we neglect to recognize the service which France has done, acting as friend to both parties and suggesting reference to arbitration. The success of the plan reflects great honor on Foreign Minister Delcassé and Ambassador Cambon, and must afford them intense satisfaction. And we must give our meed of honor to the restraint exercised by the British people, and to the good will of the Czar, whose initiative created the tribunal of The Hague, altho it had been no part of his scheme of the Conference, and who has now found it his protection and his salvation.

But we cannot help turning from this grand conclusion to the *opera bouffe* which started the trouble. We have peace with honor, and also peace with humor. The whole thing is a grim and awful joke. Think of a great fleet, long prepared, long announced, at last starting on a voyage around the world to finish up the war with Japan, but crazier than Don Quixote when he discovered the hostile windmills and was beaten by them, their huge battle ships attacked as were the old gladiators entangled in the nets of *retiarii*, by an army of seines

and fishhooks, so blind with blue terror that they could not tell the whiz and gleam of a rocket from the flash and boom of a canon. Nothing funnier has happened in the mocking tales of Spanish chivalry. Started in grandiose assurance, the Russian Baltic squadron has been stopped with the ridicule of the world. What can we expect its end to be?

The Democratization of Music

Music is the greatest of the arts. But it is also the most difficult, both of creation and of interpretation. And, tho its effect may be, for the moment, most powerful, the art itself is the most evanescent. This being so, it is only with repeated hearings that its appeal to the understanding and the emotions triumphs and becomes such a powerful factor for culture and refinement. Whatever agency brings it within the reach of greater numbers of people is a forward step in the world's advance, a blessing to humanity.

In the civilized world the pianoforte has been for a hundred years or more the most popular of musical instruments, and in the course of the century it has steadily grown in public favor as it has steadily been improved. Tens of thousands of pianos are now made and sold every year. The piano is the music-maker best adapted for use in the home. It is an orchestra in miniature. Its scope and possibilities for the solo performer are greater than those of any other instrument except the more expensive organ. It is easier to play than the violin or the violoncello, for while it is one of the most complex of musical instruments it is also one of the most mechanical. Yet it is not easy to play well. Proficient piano technic can be acquired only by constant and arduous practice from childhood days; and, if it is to be retained, such practice must be continued unremittingly as long as playing is kept up. The fingers must be trained, and, more, the muscle and sinews of the hands, wrists and forearms must be developed and hardened. Such a course of strenuous toil is too much for most people. And so many a music lover gives up trying to play because he cannot acquire the necessary technic.

But henceforth these difficulties are to vanish. The self-playing piano has arrived. The development in the United States of this instrument has been a gradual and steady advance toward perfection. To-day the best of the mechanical players give effects satisfactory to the most fastidious. Altho, a mechanical device, it transcends the region of automatics. It supplies a sure and flawless technic, with which the musician, or the man who cannot read a note and who never touched a keyboard, is able to play the most difficult compositions of the pianoforte masters—the musician, of course, with greater artistry. The layman, however, can learn in a surprisingly short time to control the mechanism and obtain effects of tempo, accent and dynamic contrasts heretofore only possible to a Liszt or a Paderewski.

What this means for music it would be almost impossible to exaggerate. It places within reach of people unable to play any instrument the possibility of hearing the best music in their homes, and hearing it excellently well played. The mechanical piano player is as far ahead of the music boxes and musical toys of a few years ago as the modern pianoforte is ahead of the spinet of our great-grandmothers' day; and the music prepared for it in all kinds, classical and popular, light and heavy, grave and gay, affords an inexhaustible repertory. The greatest need of music in America is a larger body of intelligent music lovers—a growth in the popular appreciation of good music, as in Italy and Germany. This these mechanical piano players should go far to foster. They are capable of giving greater pleasure to the listener than the pianist of even more than average ability, and it is said by some that the enjoyment of the performer in giving all his attention to shading and accentuation is keener than if his own fingers are danced over the keys. The possibility of playing the sonatas of Beethoven, the nocturnes of Chopin, the impromptus of Schubert, the transcriptions of Liszt—in short, all the classic masterpieces—without having to undergo the drudgery of years of preparation is ample warrant that the appreciation and the love of those masterpieces will increase and spread as never before.

A point worth a word in passing is the

cost of the mechanical pianist. While its price may seem at first sight high, yet when compared with the cost of the ordinary pianoforte plus the lessons necessary to acquire any degree of proficiency it is seen to be inconsiderable. When this is widely realized the mediocre music teacher will probably find his occupation partly gone, but that will not be all loss.

We know very well that "machine" music, even the best, even made equal, if that were possible, to the most delicate phrasings of a Liszt, while it provides superior pleasure for the hearer, does not make the musician. Yet, if the composer or the skillful performer represents a much higher intellectual achievement, this American contribution to the noble art is by no means small. It is something to democratize music, to make it accessible, and thus make it mean more to all the people.

Making Life Worth Living

In what we have said about the "simple life" we have urged that the only possible relief from the nerve destroying complexity of modern civilization lies in a giving up of things no longer worth while.

The physiologists tell us that a prime cause of old age and death is a failure of the bodily organism to eliminate its waste products. Great masses of surplus material become fat cells, and other useless tissue, weighing down and smothering heart, kidneys and other organs, and, by mere avoirdupois, putting an unnecessary strain upon the vital energies. Every business man knows how serious is the practical problem of keeping his desk and office "cleaned up," a task involving a difficult and hazardous decision upon the ever-recurring question, what papers to file away and what to destroy. Probably half of all the bankruptcies that occur are attributable to the hesitation of business men to "write off" from their accounts nominal assets that have ceased to have value.

Analogous to all these examples is the spiritual life of the human race—the life of mental, moral and social interests. We try to carry along indefinitely the habits, the forms, the conventions, the supposedly moral requirements, that were useful in the past, but that have become, in fact, mere waste matter, useless accumulations, a weight and handicap, taxing our energies to do work that counts for nothing.

There are two stages of civilization in which the simple life is possible. One is the colonial, the other is the highly finished stage, that one may see "in spots" in England, in France and in Japan. Colonists have of necessity cut out of their life a great deal that most of us think necessary to our comfort or convenience, and they find rich compensation in their freedom from useless expenditures of time, strength and money. Certain cultivated classes in finished civilizations have learned at last the art of *selection*, of saying to themselves, "There are certain things that we have come to look upon as supremely desirable. These we will have, and these we will leisurely enjoy. Whatever interferes with our possession of these, or with our leisure to enjoy them, shall be sacrificed."

Let us be specific. We will begin with an item of the most material and practical kind. The colonist has but little furniture. The cultivated Englishman or Frenchman of moderate means has little more. The Japanese gentleman of artistic sensibilities has least of all. There is hardly a house in America that would not be improved in "livableness," in substantial comfort, and especially in attractiveness, if, some evening, the good man and his wife should sit down and make up a list of exactly one-half of their possessions to be consigned next morning to the bonfire. The American house of the family that has a love of rare and curious things, as so many Americans have, is a museum, and the exhibits are everywhere in sight. The Japanese gentleman who boasts a fine collection of rare vases keeps them in a fireproof cellar under the little garden. One beautiful object stands on a low table in the living room. From time to time it goes back to storage, and another takes its place. This practice is typical of the Japanese method of securing the simple life.

To glance next at a condition of the immaterial order, a cultivated gentleman of the finished civilization does not permit himself to be drawn into more activi-

ties, social relations and responsibilities than he can adequately meet. He selects his friends, which means that he does not allow himself to be made unhappy because a lot of pushing acquaintances are aggrieved that he does not spend his time in consorting with them or entertaining them. He chooses his line of business or professional activity and gives his attention to it, without feeling that he is a nobody if his name does not appear among the managers or directors of a hundred enterprises that he could not possibly throw his earnest effort into. He belongs to a good club, but he does not work overtime to earn the wherewithal to pay dues in a dozen clubs that he could not find time to enjoy.

Finally, to mention a group of interests of the specifically mental and moral order, the really cultivated gentleman of a finished civilization has learned to select the objects of his intellectual and ethical allegiance. That means, when we analyze the process, that he has disciplined his mind and his will. To use Professor Munsterberg's happy phrase, he has discovered that the essential thing in education is the development of the power of voluntary attention. He has learned to work while he works, and to play while he plays. He has discovered that he cannot know everything or read everything, and has made up his mind to know some things well, to read some books and periodicals with critical thoroughness, and to let the others go by unnoticed. He has discovered that the principles of conduct that are really essential to human wellbeing are in reality few and simple, and those few he scrupulously observes.

On this last point, since it is after all the one of supreme importance, let us be even more specific. Again we will cite a habit of that people which, perhaps more than any other, has solved the problem of the simple life in a complex civilization. To the Japanese mind strict cleanliness is the foundation of all the decencies. Long before they knew the modern code of bacteriology the Japanese by sound instinct had committed themselves to the habit of eliminating and destroying from all their surroundings those accumulations of dirt and worthless material that we now know to be the storehouses of infectious germs. An American gentleman who stepped from the street pavement upon the floor of a Japanese teahouse without removing his shoes was shamed to see his entertainers scrubbing and polishing the spot where his feet had rested. To maintain perfect cleanliness costs time and effort, but it prevents incalculable waste of time and effort in the end.

Cleanliness is next to godliness, and to the highly cultivated man godliness itself is an unswerving devotion to essential truth, and essential truth consists in eternally seeking to know the truth, rather than holding with stubborn bigotry to formulations of supposed truth that were taught to us in our chilhood. Can any one measure the enormous waste of energy, of happiness, that might have been avoided if throughout the long warfare of enlightenment with tradition every man had been honest with himself and had unflinchingly resolved that he would adhere with single-mindedness to a purpose to learn or discover truth rather than to a purpose to defend some formulation of doctrine with which business or social interests have become entangled?

In the end it all comes to this: We may, if we will, select from the infinite mass of things, of activities, of interests, of alleged principles, pressing upon us with their remorseless demands, those few loyalties that are really essential, really fine, really worth while, and let all the rest go. So to choose is to live the simple life, and to make life worth the living.

Secretary Hay's Invitation

Secretary Hay's tentative invitation to the Powers to join in another Hague Conference is concluded in plain but guarded language. It bases its request on the record of The Hague Conference itself, which looked to another meeting, and on the request of the Interparliamentary Union made to President Roosevelt. It is careful to explain that if the invitation comes at the time of a war in the East, the previous meeting of the Conference was called before peace was concluded between the United States and Spain, and that it is not to be expected that the Conference will in-

tervene in the present war. It is the further codification of international law which Secretary Hay suggests, and, what might have much meaning, "how to give future effect" to its conclusions. That might be interpreted as looking to the executive functions of The Hague Conference; already it has had legislative and judicial duties. Secretary Hay embodies in his call, if we may call it so, altho it is realy only a feeler to see if the other Governments will consider the matter, the action of the Interparliamentary Union suggesting that the proposed Conference plan for meetings at stated periods, and for the negotiation of arbitration treaties, but he does not specifically indorse the suggestion. It will be time to incorporate these, if at all, when the formal call for the Conference is agreed upon.

The Episcopal Convention

Much the best work of the Episcopal Convention, which closed its long triennial session last week, was the amendment to the constitution, allowing bishops to receive congregations, especially Scandinavian, which do not wish to use the Prayer Book, being accustomed to another form of service. The relief is in the line of liberty, which is much more important than is uniformity, if a Church wishes to move in the direction of unity. We are glad that the effort to forbid remarriage where the Bible allows it failed of success. That a year should pass before even the innocent party should marry again, is only decent, and is a good rule, if rule there must be. The Bishops' Pastoral Letter calls for some comment. Quite correct is their warning that "the parish priest must not utter one thing while the language in which the most ancient and solemn offices of the Church are clothed proclaim another;" and yet it needs qualification. It is true that, as the Bishops say, "he must not eat his Mother's bread and yet revile her claim to a divine legitimacy;" and they further add that "if one finds, whatever his office or place in the Church, that he has lost his hold upon her fundamental verities, then in the name of common honesty let him be silent or withdraw." But what are the "fundamental verities?" Have they ever been specified? There were bishops who thought that Phillips Brooks was not fit to be made bishop because he had lost these verities. Doubtless there is much in the Prayer Book and the Articles which bishops and clergy are free to disbelieve, because they are not "fundamental." The Pastoral Letter speaks of the labor problem, but gives no clear light. The negro question, it says, is "the gravest problem of our American life to-day and the most increasingly menacing." Then, certainly there ought to be some clear ethical and Christian principles laid down for guidance, but we do not find them. They say that the race "were brought to these shores by no choice or consent of their own." Nonsense; they are all native born like the rest of us. The letter adds:

> "If by giving them freedom, we have only given them the power to work mischief, and if lynching has come to be defended as a necessary protection to families, then surely we are face to face with a situation at once desperate and dishonoring."

We most heartily trust that this statement does not anticipate the conclusion of the commission appointed to study the problem; for it is not true that freedom gives power only to "work mischief," and it is not true that lynching should even be thought of as "a necessary protection to families," and it is not true that the situation is "desperate," much as there is "dishonoring." Such a sentence is surprising, and it is all that is said.

The Advancing South

Such a phenomenon as the political utterances of ex-Governor Hogg in Texas, supported as he is by a multitude of citizens, is hopeful of broader views than have prevailed in the South. He does not wish to join the Republican Party, and he is disgusted with the Democratic Party, and is inclined to start a party of his own that will look on the new century with a smile. But for the stupid fear of the negro vote many thousands in Texas and other States would follow President Roosevelt's banner, but they are ridden by the nightmare of that dinner with Booker T. Washington, as if

it involved the slightest danger to free institutions. The solid, decent and intelligent middle class all over the South are not, we are convinced, in sympathy with such ranters as Senator Tillman, who defends lynching, or Governor Jefferson Davis, of Arkansas, who says in a public speech that he would as soon eat with a hog from a trough as with a negro, or Governor Vardaman, whose veto of a $2,000 appropriation shut up the only normal school open to negroes supported by the State of Mississippi, a month before 19 teachers were to graduate. It is pleasant to know that when that school was closed at Holly Springs, Bishop Cottrell, of the Colored Methodist Church, was able to raise $15,000 among his own people to start one in its place. We see frequent accounts of the better feeling of Southern white people toward their colored brethren. In this last case handsome contributions came from white men. We notice a late case in Lancaster, S. C., where at the funeral of the colored Bishop Clinton, the court adjourned in honor of him. Such cases are not unusual, altho they attract less attention than lynchings.

Is Crime Increasing?

At the National Prison Congress, held at Quincy, Ill., it was shown by Mr. Eugene Smith, of New York, that there are no statistics whatever in the United States, not even those published by the United States Census, that are of any value in answering the question, Is crime increasing in the United States? Mr. Smith showed the fallacy of drawing conclusions from a count of the prison population taken once in ten years. His conclusion was that crime is not increasing in the United States in proportion to the population. How long is this to be a matter of conjecture in the United States? Most of the civilized countries of the world are far in advance of the United States in being able to present statistics not only of prison population and police arrests, but of judicial convictions. But we cannot even tell how many murders or high crimes are committed in this country, the only information on this subject being furnished by means of a blue pencil and a pair of scissors in a Chicago newspaper office, which have been the basis of many misleading statements. It is not surprising, then, that the National Prison Association, alive to the importance of more accurate information, should have appointed a standing committee to urge this subject on the attention of the Government and to secure such modification in the law and such additional appropriation as will permit the census bureau to secure annually the statistics of crime. Director North, of the census bureau, is fully in accord with the movement, and it ought not to take long to convince Congress of its importance. Until this is done let it be remembered that pessimistic newspapers that are constantly asserting the increase of crime in the United States have no basis in fact for their assumptions.

Looking Backward

The London *Times* has the interesting custom of reprinting every day an item from the issue of the paper which appeared a hundred years before. The following quotation from the *Times* of October 18th, 1804, is of peculiar interest to Americans, for it shows what deadly sarcasm was then heaped upon those who professed to believe in liberty and constitutional government, and yet purchased from France the inhabitants of Louisiana:

"The Advocates of what are sometimes called 'The Rights of Man,' may find a pretty fertile subject for their speculations in the existing circumstances respecting the province of Louisiana, ceded by Spain to France, and sold by the latter Power to the American Republic. Passing over the question of the *transfer*, and of the *sale* of so many subjects, thus is the dispute between the Republicans and the inhabitants of Louisiana: The latter seem to argue very conclusively, upon the idea of being American citizens, against the negation of those privileges which are held so sacred in the other States of the Union; yet, while they talk of the *equality* of the *rights of mankind*, they are obsolutely striving to stipulate for liberty to continue the importation of *slaves*. Their plea is necessity, and the American Government may make the same plea for restricting *them*. Such

are the inconsistencies into which all the visionary theories of politics infallibly lead those who profess to frame Governments by their maxims."

In 1999 when the Americans of the Philippine Islands are thronging to the "Philippine Purchase Exposition" at Manila, they will find great amusement in reading the extracts which the journals of that time will republish from the anti-imperialistic literature of the present campaign. The "visionary theories of politics" which our forefathers so boldly incorporated into the Constitution and Declaration of Independence work out their own salvation in spite of the temporary "inconsistencies" incident to their practical application.

Second or First Hand?

Concerning the kind words of Pius X to Mgr. Geay when he resigned, our esteemed Catholic contemporary of St. Louis challenges us with the question: "Who spoke them?" We answer: Mgr. Geay did in an interview with Mons. Mouthon, of *Le Matin* of Paris. Later on the ex-Bishop of Laval telegraphed from Cannes to *Le Croix,* an organ of the clerical party, that M. Mouthon was romancing. Next, the latter repeated his statements and telegraphed to the Bishop that the two articles in *Le Matin* were:

"Word for word the faithful and integral reproduction of our conversation and of the words you bade me repeat in justification of your departure and resignation."

To this Mgr. Geay in a telegram replied:

"I withdraw the expressions, which were written in anger. No doubt it is the conversation which took place between us, but I found it hard to recognize, because it had been amplified in form. You promised me not to publish anything. I am very sorry."

If Mgr. Geay runs with the hare and hunts with the hounds it is only a fresh proof that the miter does not change the man—a fact which it would be well for our Catholic exchanges to remember. For whenever a priest becomes a bishop, nothing but superlatives thereafter can be found to fit or describe his talents. Hence our authority is first hand—namely, the second party to the dialog, Mgr. Geay. No second-hand testimony appeared in our editorial. See the *Tablet,* London, September 24th, 1904.

Untaxed Church Property

In Larger New York there is $216,694,195 of church property that escapes taxation, according to the statistics of the Federation of Churches. Every cent of it we believe ought to be taxed, but it will not be, because all sorts of religious people, however else they differ, agree to evade taxation. Every dollar's worth evaded is so much of a lie to our principle of separation of Church and State. For the Government to give up its taxes is just the same as to give a subvention as they do in France. Of this great total the Protestant Churches escape taxation on $115,072,255, the Catholic on $55,582,065; the Jewish on $13,420,050; the hospitals on $14,782,400; the educational institutions on $12,255,500. Of the Protestant Churches the largest figures are credited to the Episcopal, $53,000,450; the Presbyterian, $16,710,100; the Methodists, $8,513,050; the Reformed Dutch, $7,117,120; the Baptists, $6,564,455; while the Congregationalist comes next, with $2,632,085; but the four Lutheran denominations aggregate $4,041,195. These figures are large enough to require serious consideration of the principle involved. The right and radical doctrine is that taxes should be remitted only on property which the Government owns and administers; all else should pay for protection, no matter if it does in its own way serve the public and benefit the State.

In addition to its primary purpose of cementing together the Anglo-Saxon race, the benefaction of Cecil Rhodes has prevented his alma mater from a serious decline in numbers. The number of Freshmen registered in the University of Oxford at the beginning of this term was 763, one less than that of last year. Since 73 of these are the Rhodes scholars now entering for the first time, it appears that the attendance would have fallen off 10 per cent. if it had not been for the Rhodes "university extension" movement.

Insurance

Life Insurance as a Science

FREDERICK L. HOFFMAN, statistician of the Prudential Insurance Company of America, read a paper on the above subject at the International Congress of Arts and Sciences, at St. Louis. Mr. Hoffman said in part as follows:

"The honor of having been the first to assign a definite place to insurance in the science of economics appears to belong to Henry Dunning McLeod, whose conception of economics comprehends, first, material things; second, personal qualities, both in the form of labor and credit; and, third, annuities. Most of the works on political economy and social science are barren of references to the third department, which, for want of a better term, Mr. McLeod defines as annuities, or the 'right to receive a series of future payments.'

"Insurance means the application of the principle of association to the equalization of losses resulting from uncertainty in human affairs. This is the risk of untimely death, of fire, shipwreck, burglary, wind storms, floods and many other contingencies outside of the control of man. The uncertainty of human life is modified by social progress, in particular by the advances in medicine and related sciences, but there must always remain the risk of premature death, which insurance alone can equalize through the principle of association.

"The theory of risk and insurance has been elaborated and set forth by Allan H. Willett in one of the Columbia University publications. He holds that as a general rule uncertainty exercises a repellant influence in human life, and that the existence of risk in an approximate static state causes an economic loss, while the assumption of risk on the other hand is a source of gain to society. From this point of view the business of insurance does not differ essentially from general commercial enterprises. Risk is assumed in mining and agriculture in much the same manner as risk is assumed in the business of insurance, but in life insurance the assumption of a risk and the equivalent premium payments required are determined by the theory of probability and established laws of human mortality and observed experience. In general commercial enterprise the risk assumed is, as a rule, created, while in insurance the risk assumed is pre-existing. This marks the broad division between gambling and insurance. Insurance is not 'in the nature of a bet,' for in insurance an effort is made to eliminate an existing risk by its assumption on the part of the many, while in gambling a non-existing risk is created, with resulting uncertainty and needless loss to society.

"The gain to society is the reduction of uncertainty for the group as a whole, or the substitution of certain loss for uncertain loss. The cost of the risk to society is thus very considerably reduced, if not entirely eliminated, and it follows, in the words of Willett, that 'the risk an insurance company carries is far less than the sum of the risks of the insured, and that as the size of the company increases the disproportion becomes greater,' or, to use a definition of Roscher, 'the aggregate danger is less than the sum of the individual dangers, for the risk of it is more certain, and uncertainity itself is an element of danger.' It is of the utmost importance that this point should be thoroughly realized by statesmen and the general public, so that from individual appreciation of insurance as a beneficent social institution may evolve the national appreciation of insurance as an institution making for the security of society and the well-being and effective protection of its members against the uncertainties of human life.

"As it has been pointed out by the Hon. John F. Dryden in a paper on 'Insurance as a Career,' 'in a general way it may be said that the scientific temperament is most likely to lead to success in home office administration, for scientific training, as well as all higher education, distinctly qualifies a man for administrative responsibility.'

"Insurance is to-day the foremost social institution of civilized countries. The business has assumed enormous proportions, and the tendency of the 'insurance idea' is toward an ever-increasing area of general usefulness. To both the individual and the State insurance is to-day an indispensable method and means for the maintenance of our standard of social security and progress. In the struggle of the masses for economic freedom and a more equitable distribution of wealth, insurance aids and sustains all other forces making for this much-to-be-desired end. Insurance in its final analysis is simply a business method to make the world a better place to live in, than which no aim or purpose could be a higher and more worthy one."

THE rates charged by marine underwriters for covering the war risk on shipments in zones prospectively affected by the differences between England and Russia have just been considerably advanced. In some cases the advances have reached a point double that formerly charged. Notwithstanding the increase in tariff the demand for war risk insurance has expanded, many shippers wishing to have their freights protected before further possible advances took place.

Financial

The New Haven's Coal Road

THE New York, New Haven and Hartford Company has obtained control of the New York, Ontario and Western by purchasing a majority of its capital shares at a price said to be $45 per share. This transaction naturally follows the New Haven Company's recent purchase of the Central New England, or Poughkeepsie Bridge, route, which connects with the Ontario a short distance west of the Hudson River. It adds about 500 miles to the New Haven's lines, and gives access both to the lakes (at Oswego) and to the anthracite coal fields. Probably the purchase was made on account of the Ontario's coal interests. It was by means of the Central New England and another road, which is also now owned by the New Haven Company, that McLeod, of the Reading, sought twelve years ago to open the New England market for his coal. Now the advances are made from the other end of the line; the greatest railroad company of New England enters the coal fields.

The Tariff on Wheat

OUR exports of wheat in the nine months ending with September were only 9,762,000 bushes, against 54,000,000 in the corresponding months of 1903, 96,000,000 in 1902, and 139,000,000 in 1901. Exports of flour were less by about 35 per cent. than the average for the last four years. Owing to the shortage in this year's crop and the high prices now prevailing, this decline of exports will not be checked. The great flour mills of Minnesota have a productive capacity that can be fully utilized only when there is a large surplus for export at moderate prices. The spreading wheat fields of Canada's Northwest have a large surplus this year, but we can import it for consumption only by paying our protective duty of 25 cents a bushel. In order that their men may be employed and their export trade sustained, two of the great mills in Minnesota have been placed under Government bond and supervision. In this way they can grind Canadian wheat and export the flour without paying the tax of 25 cents a bushel. This is one of the tariff duties that were imposed to conciliate agricultural interests and facilitate the imposition of other and much higher duties on manufactured goods. When we have a considerable surplus for export it is inoperative. When our crop is short and prices are high, wheat growers gain little or nothing by it, while it cuts down the export trade and injuriously affects the milling industry.

THE Erie Railroad Company is planning to use electric power on fifty miles of suburban lines in New Jersey.

....A sensational discovery of gold has been made in Nevada, at the town of Gold Fields, whose population has recently increased from 300 to 10,000.

....It is expected that electric power will be transmitted next year from Niagara Falls to Syracuse, 160 miles, for the use of the trolley cars in that city.

....An official report shows that the United States Steel Corporation's net earnings for the quarter ending with September were $18,773,932, against $19,490,725 in the preceding quarter, and $32,422,955 in the corresponding quarter of 1903. Unfilled orders on hand declined from 3,192,277 tons on July 1st to 3,027,436 on October 1st, but are now increasing.

....Pensacola is no longer the leading Southern port with respect to lumber shipments. Gulfport, three years ago comparatively unknown, has assumed the leadership, exporting last year 193,000,000 feet of lumber, as compared with 174,000,000 feet from Pensacola. Present shipments are being made at the rate of over 250,000,000 per annum. The greater part of this growth has been due to the Gulf & Ship Island Railroad, whose southern terminals are at Gulfport.

....Dividends announced:

Nassau Bank, semi-annual, 4 per cent., payable November 1st.

N. Y. Cent. R. R. (Rome, Watertown & Ogdensburg Div.), 1¼ per cent., payable November 15th.

Minn. & St. Louis R. R. (Consolidated Mort. 5's), Coupons, payable November 1st.

U. S. Leather Co. (Debenture Coupons), payable November 1st.

The Independent

Vol. LVII NEW YORK, THURSDAY, NOVEMBER 10, 1904 No. 2919

Survey of the World

Mr. Roosevelt Replies to Judge Parker

Owing to what Judge Parker has said in recent speeches about the collection of campaign funds from corporations by Chairman Cortelyou, Mr. Roosevelt gave to the public in reply, on the night of the 4th inst., a signed statement, beginning as follows:

"Certain slanderous accusations as to Mr. Cortelyou and myself have been repeated time and again by Judge Parker, the candidate of his party for the office of President. He neither has produced nor can produce any proof of their truth; yet he has not withdrawn them; and as his position gives them wide currency, I speak now lest the silence of self-respect be misunderstood.

"Mr. Parker's charges are in effect that the President of the United States and Mr. Cortelyou, formerly Mr. Cleveland's executive clerk, then Mr. McKinley's and my secretary, then Secretary of Commerce and Labor, and now Chairman of the Republican National Committee, have been in a conspiracy to blackmail corporations, Mr. Cortelyou using his knowledge gained while he was Secretary of the Department of Commerce and Labor to extort money from the corporations, and I, the President, having appointed him for this especial purpose.

"The gravamen of these charges lies in the assertion that corporations have been blackmailed into contributing, and in the implication, which in one or two of Mr. Parker's speeches has taken the form practically of an assertion, that they have been promised certain immunities or favors or have been assured that they would receive some kind of improper consideration in view of their contributions."

The question at issue was not, he continued, whether contributions had been made, but what was in effect an assertion by Mr. Parker that they had been made "for improper motives, either in consequence of threats or in consequence of improper promises, direct or indirect." Mr. Parker "knew best" whether this was true of the contributions to his campaign fund which had "come through his trusted friends and advisers, who represent the great corporate interests that stand behind him." It was not true as regards anything in the management of the Republican campaign:

"Mr. Parker's accusations against Mr. Cortelyou and me are monstrous. If true, they would brand both of us forever with infamy, and inasmuch as they are false, heavy must be the condemnation of the man making them."

He had chosen Mr. Cortelyou as Chairman, the President continued, after he had failed to persuade Mr. Elihu Root, ex-Governor Crane, or Mr. Cornelius N. Bliss to accept the place. He had chosen him with extreme reluctance, because he could ill spare him from the Cabinet, but he felt that Mr. Cortelyou possessed the high integrity which he demanded in the man who was to manage his campaign. He was content that Mr. Parker and himself should be judged by the public on the characters of the two men they had chosen—Mr. Cortelyou and Mr. Taggart:

"The assertion that Mr. Cortelyou had any knowledge gained while in any official position whereby he was enabled to secure and did secure any contributions from any corporation is a falsehood.

"The assertion that there has been any blackmail, direct or indirect, by Mr. Cortelyou or by me, is a falsehood.

"The assertion that there has been made in my behalf and by my authority, by Mr. Cortelyou or by any one else, any pledge or promise, or that there has been any understanding as to future immunities or benefits in recognition of

any contribution from any source is a wicked falsehood.

"That Mr. Parker should desire to avoid the discussion of principles I can well understand. So far it is but the bare truth to say that he has not attacked us on any matter of principle or upon any action of the Government save after first misstating that principle or that action.

"But I cannot understand how any honorable man, a candidate for the highest office in the gift of the people, can take refuge not merely in personalities, but in such base and unworthy personalities."

If he deemed it necessary to support his flat denial by any evidence, Mr. Roosevelt added, he would ask men of common sense to compare Mr. Cortelyou's campaign work with what Mr. Parker did when he was managing Mr. Hill's campaign for Governor, and to compare the course of his own Administration as regards the great corporations and moneyed interests with "what was done under the last Democratic Administration while Mr. Olney was Attorney-General:"

"I would ask all honest men whether they seriously deem it possible that the course this Administration has taken in every matter, from the Northern Securities suit to the settlement of the anthracite coal strike, is compatible with any theory of public behavior save the theory of doing exact justice to all men without fear and without favoritism; I would ask all honest and fairminded men to remember that the agents through whom I have worked are Mr. Knox and Mr. Moody in the Department of Justice, Mr. Cortelyou in the Department of Commerce and Labor, and Mr. Garfield in the Bureau of Corporations, and that no such act of infamy as Mr. Parker charges could have been done without all these men being parties to it.

"The statements made by Mr. Parker are unqualifiedly and atrociously false. As Mr. Cortelyou has said to me more than once during this campaign, if elected I shall go into the Presidency unhampered by any pledge, promise, or understanding of any kind, sort, or description, save my promise made openly to the American people, that so far as in my power lies I shall see to it that every man has a square deal, no less and no more."

Replies from Others

Before this statement was issued, denial of the charges had been made in public addresses by Senator Lodge, Secretary Shaw, Secretary Wilson, Senator Fairbanks, ex-Secretary Root and others. Mr. Root said (on the 4th) that Judge Parker had descended to personalities of an "infamous" character. He had charged in substance that the President and Mr. Cortelyou had "conspired to blackmail the Trusts" by using Mr. Cortelyou's secret official information and by promising that the Trusts should control the Government:

"The charges are absolutely and totally false. The fact is that the Department of Commerce and Labor has no secrets of corporations. It is newly organized, and the necessarily slow progress of organizing a new department, getting together its forces, determining upon its course of action, and its methods, collecting the vast mass of statistics and information and details necessary as the basis for action, has been such that the process of collecting information has not yet gone beyond the stage of getting the information that is common to all the world. And neither the Department, nor Mr. Cortelyou, nor the President had any information or secret of any corporation or Trust that you or I or any one of us have not."

Governor Odell asserted that Judge Parker was financially interested in the Shipbuilding Trust, having become the owner of $25,000 of stock. Said the Governor:

"He asked me to let him have it. I instructed my agent to give it to him, and he paid for it. And this is not the only Trust that Judge Parker assisted in promoting. I know he had stock in the United States Steel Trust."

In a later speech the Governor said that the Judge, at his own earnest request, was enabled to become one of the underwriters of the project and had taken $25,000 in bonds, receiving with them a bonus in stock. To this Judge Parker has made no reply.—Chairman Cortelyou, on the night of the 5th, published a statement in which, after predicting that Roosevelt and Fairbanks would have 314 electoral votes, he said that the fund had been the smallest in twelve years, one-half as large as the Republican fund in 1896 and one-half as large as the Democratic fund in 1892, when Mr. Cleveland was elected:

"Every part of this fund has come from voluntary contributions made without demand, importunity, or pressure, and without any agreements, pledge, promise, assurance, or understanding, express or implied, regarding the policy or the action of the Administration, or

looking to any benefit or advantage to any contributor, except the benefit which will come to all business and to all our people from the continuance of Republican policies and Republican administration."

Senator Knox denounced Judge Parker's charges as a malicious slander, saying that the Judge, as a candidate, was "the product of a compromise between Tammany Hall, William R. Hearst, David B. Hill, W. J. Bryan, the solid South and the worst element in Wall Street," a candidate "syndicated by these people for the purpose of taking advantage of an alleged adverse feeling in business circles toward President Roosevelt because he had enforced the Anti-Trust law."

Judge Parker's Charges and Rejoinder

The charges to which Mr. Roosevelt's statement was a reply were made by Judge Parker in several speeches. In New York, on the 31st ult., he remarked that "the spectacle of demanding campaign funds now presented to this country" was "of a character to shock the moral sense." Mr. Cortelyou, the President's private secretary, had been placed by the President at the head of a Department charged with the collection of information from corporations and Trusts, and this information was to be submitted to the President "for public or private use." Now Mr. Cortelyou, "by the grace of the same Executive," had been made Chairman of the National Committee, whose chief duty was "to collect funds for the purpose of securing the election of the President," and it was notorious that an overflowing treasury had resulted from this "organized importunity." This might be "satisfactory to the conscience of Republican leaders," but it ought to be condemned as "nothing short of scandalous." Mr. Hay had said that the character of Lincoln was Mr. Roosevelt's standard. Judge Parker asked whether Lincoln would have done this or permitted it to be done:

"The whole performance is a shameless exhibition of a willingness to make compromise with decency, in order that sums of money may be gathered together sufficiently vast to justify the insolent boast even now that there is no question as to the success which by such a course the Republican leaders so confidently predict. The performance is entitled only to the credit that in no sense it partakes of hypocrisy. It is as bold as it is improper and indefensible."

On the following day, in Jersey City, having asked why there should be any hesitation about prosecuting all combinations that sought to control market prices, Judge Parker asserted that "the Trusts" were "furnishing the money with which they hope to control the election." If this were not true he would not say it, even to gain the Presidency. Senator Knox, after a consultation with the President, had published a statement in which, however, he did not meet the charge:

"He did not deny it. He could not, nor could the other party to the consultation. . . . These grave charges cannot be met anonymously. There are only two persons who can interest the people on this subject."

Questions asking how much the Beef Trust and other Trusts had contributed to Mr. Cortelyou, he said, would not be answered. In Hartford, on the 3d inst., he repeated the charges. The legislation providing for the collection of information about Trust corporations was scandalous. It put "into the hands of the President" and of his party "the means of continuing their hold upon the reins of government without limit as to time." It was known, he added, how the opportunity had been used in this campaign. The country did not need a Secretary of Commerce who should go out every four years with his notebook full of corporation secrets "to exploit corporations for the collection of money to be used in corrupting the franchise, electing pliant legislators, or capturing the electoral vote of pivotal States." Speaking at Meriden, he declared that this question was more important than any presented in the national platform. The Trusts had "united to raise a fund large enough to control the election." Mr. Cortelyou had been made Chairman of the Republican Committee:

"Whatever information he had, if he had any, was perfectly well understood by the heads of organizations. They knew what secrets they had that they did not care to have made public. I do not know that he had any information, but his position was one that entitled him to get it. From that time on there has been

a gradual movement in that direction until it is believed that every Trust in this country, including the Standard Oil Trust, is doing what it can to elect that ticket."

In Brooklyn, on the 5th, Judge Parker began a reply to Mr. Roosevelt's statement by quoting about 1,200 words of his speech of October 24th. If the President, he said, had been moved by that warning to say that there should be no more Trust contributions to his fund, "it would have sounded like the Roosevelt we once knew." But he did not say it, and the Trust money continued to pour in. The President had waited until the closing hour of the campaign to make easier the pretense of an answer. His statement was not an answer; it was "a confession with a plea in avoidance." Definite immunity from prosecution had not been promised, the President said, but there was to be a square deal. When the time should come for determining what should be a square deal for the contributing Trusts, "the beneficiary of their generosity must either recognize their service or confess himself guilty of base ingratitude." As to his own course, Judge Parker said:

"I requested the Democratic national campaign managers that they should not receive, directly or indirectly, from any Trust, money for campaign purposes. I notified them that I proposed, if elected, to enter upon the discharge of the duties of that great office unhampered by any obligation to interests or to men. I said to them that I would rather be defeated than be fettered in the effort to accomplish reforms that are sorely needed. And I am advised by them that my request has been scrupulously respected."

He regretted that the President had not co-operated with him in checking this evil. Now that this intended crime against the franchise had been exposed, "we should take every possible precaution to secure both Congress and the Presidency," in order to assure legislation that "will remove this illegal business from politics," legislation making it a crime for the officers of a Trust or corporation to contribute money for the control of an election, legislation severe enough to "dissolve all partnerships between corrupt business interests and the Government." In his judgment, there was no problem so pressing as this. "Its settlement by the absolute and final exclusion of bribery or the threat of bribery or the raising of money for this foul purpose is, to my mind, the most important question that can come before a free and moral people."—In a public address on Sunday night Congressman Bourke Cockran promised to introduce at the beginning of the coming session a bill providing for a non-partisan commission to investigate and report as to the sources of the campaign funds of the two parties. He suggested that the Chief Justice of the Supreme Court should be chairman. He also said that he would support a bill compelling the publication hereafter of all campaign contributions.

The Liberal Victory in Canada

At the Canadian general elections, on the 3d inst., the Liberal party and the present Premier, Sir Wilfrid Laurier, won a decided victory, increasing their majority in Parliament from 54 to more than 70, and probably to 75. Elections in a few districts are still to be held. R. L. Borden, the Conservative leader, was defeated in the Halifax district, and the Liberals took every seat in Nova Scotia. The House of Commons (214 members) will stand almost exactly two to one in favor of the Liberal party and policy. Among the defeated Conservatives is Seymour Gourley, who has attacked the United States with some violence of language in debate. The leading issue was the Liberal project for a new transcontinental railway, promoted by the Grand Trunk capitalists, and known as the Grand Trunk Pacific. This road (about 3,600 miles long, from Moncton, N. B., to Port Simpson, on the Pacific Coast) is planned in two sections, the eastern and the western. The Government proposed to construct the eastern section, from Moncton to Winnipeg, and lease it to the company for fifty years, at a small annual charge after the first seven years. The company is to build the western section, but the Government is to guarantee its bonds to the extent of 75 per cent. of the cost, with certain restrictions. The cost of the entire line may be $150,000,000. It was

asserted by the Opposition that a considerable part of the projected line was not needed and could not be profitable; that in the winter freight would be diverted from Canadian Atlantic ports to Portland, Me.; and that Government ownership and construction of the entire line would be preferable to the plan of Sir Wilfrid and his party. An investigation concerning the tariff has been promised by the Liberals, and this, it is thought, will be followed by the adoption of maximum and minimum rates, with special reference to trade with the United States. The result of the elections is not regarded as favorable to Mr. Chamberlain's fiscal projects. Both parties stand by the existing preferential of 33 1-3 per cent. in favor of British imports.—At the elections in Newfoundland, Sir Robert Bond's Government was sustained by a very large majority. The island thus expresses disapproval of proposals for union with Canada, and a desire for closer trade relations with the United States.

Labor Controversies

It is said that the cotton factories at Fall River will be opened on the 14th, when the strike will be sixteen weeks old. The companies will insist, however, upon the wage reduction that caused the strike. Many workmen have left the city. It is estimated that the number of voters has been reduced by 4,000. Among the idle employees remaining there is much destitution and suffering. In other New England towns cotton factories that have been closed or on short time, and in which 10,000 persons are ordinarily employed, resumed work with full time on the 31st ult., but in some cases with a reduction of wages.—Half the coal mines in Illinois were closed on the 1st, the strike of 750 hoisting engineers having thrown 50,000 miners out of work. After a few days the miners agreed with the operators to ignore the engineers' union. Non-union men were employed, and it was provided that the strikers could return only as individual applicants, who must join the miners' union and submit to its authority. The engineers had rejected an offer of arbitration.—The existence of the Boston Symphony Orchestra was recently menaced by a controversy involving the "closed shop." This orchestra was founded and has been supported in the main by Major Henry L. Higginson. It appears that 50 members joined the Musicians' Protective Union and that trouble then arose because these members were forbidden to play in association with non-union men. Major Higginson was not hostile to unions, but he would not subscribe to the doctrine of the "closed shop." He remarked that he was willing to continue to stand by the orchestra, and that he expected that the life of it would not be limited by his death, but the organization would perish if union interference with his plans should prevent harmony in the conduct of its affairs. He should then tell the public who was responsible for the disintegration of it. Whereupon 27 of the 50 players withdrew from the union, and it is expected that others will follow them.

The Italian Elections

The Italian elections passed off more quietly than was feared. There were no serious disturbances anywhere, altho in Milan a student mob attacked some Germans on account of the Innsbruck affair. The results of the elections are not yet fully known, but it appears that the Conservatives have gained and Extremists have lost. Milan, the center of the power of the revolutionary socialists and the scene of their recent demonstration of force, has been represented altogether by Extremists, but has now elected two Conservatives, one Clerical and two Socialist Reformers, one of whom, Turati, has been outspoken in his condemnation of the general strike. For the first time in the history of the united kingdom there have been avowed Clerical candidates and a large Catholic vote. Signor Ferri, the leader of the revolutionary Socialists, was re-elected. The result of the election, altho it means the defeat of his most dangerous enemies, does not insure a continuance of support for Signor Giolitti, for many of the new members are Conservatives, who will not be inclined to support a Liberal Premier. The birth of an heir to the throne, who

will be called the Prince of Piedmont, has strengthened the monarchy.

The Tibetan Treaty

The British mission to Tibet left Lhasa on September 24th and has now reached the Chumbi Valley on the border of India after a journey through the mountains of almost unexampled hardship. On account of the difficulty of finding responsible persons to represent the Tibetan Government the return was delayed until winter had set in at those altitudes, and the passes were full of snow. In some cases the soldiers marched all day in knee deep melting snow, and many of the men were blinded, in some cases permanently. Their sufferings from frost bitten and frozen limbs were terrible, and many died. It is very questionable whether the treaty obtained with such great difficulty and cost is of any validity in itself. The Dalai Lama, the head of the theocracy, left Lhasa on the approach of the invaders, and is reported to have taken refuge in Mongolia in search of Russian protection. The treaty was signed by the Tashi Lama, who, as an ecclesiastical dignitary, ranks next to the Dalai Lama, but who has not exercised any political power. The Amban, or Chinese representative at Lhasa, did not sign the treaty, altho he apparently sanctioned the proceedings by his presence. The Anglo-Tibetan treaty has, therefore, not been authorized by the Chinese Government, which, as the British Government has always held, exercises a real suzerainty over Tibet. It is believed in England that Germany and Russia and perhaps other countries have protested at Pekin against the ratification of the Tibetan treaty, especially on the ground that Article IX under which the Tibetans engage not to grant concessions for commercial, mining or railway enterprises to foreign Powers without the consent of Great Britain, is an infringement on the rights of other nations. It is denied by the German papers that Germany has made any official protest to the Chinese Government against the treaty, but leaders in the agitation against its ratification were two native papers, supposed to be under German control, one published at Pekin and the other at Kiao-Chau, the German port. The supposed motive for this supposed action on the part of Germany is her desire to show her friendliness to Russia in this crisis. The Chinese Minister at London has requested a joint commission to consider the terms of the treaty.

The Baltic Fleet

Russia and Great Britain have come to an agreement as to the commission of inquiry to determine the responsibility of the attack on the English fishing fleet in the North Sea. The main provisions of the convention are as follows:

"First—The commission is to consist of five members—namely, officers of Great Britain, Russia, the United States and France—these to select a fifth; if they cannot agree upon a choice the selection is to be intrusted to the sovereign of some country to be chosen by Great Britain and Russia.

"Second—The commission to report on all the circumstances relating to the disaster and to establish the responsibility.

"Third—The commission to have the power to settle all questions of procedure.

"Fourth—The parties to bind themselves to supply the commission with all the necessary information, facilities, etc.

"Fifth—The commission to meet in Paris as soon as possible after the signature

"Sixth—The report of the commission to be officially communicated to the respective governments."

The Russian squadron continues its passage through the Mediterranean from Tangier to Suez, closely followed by British war ships.

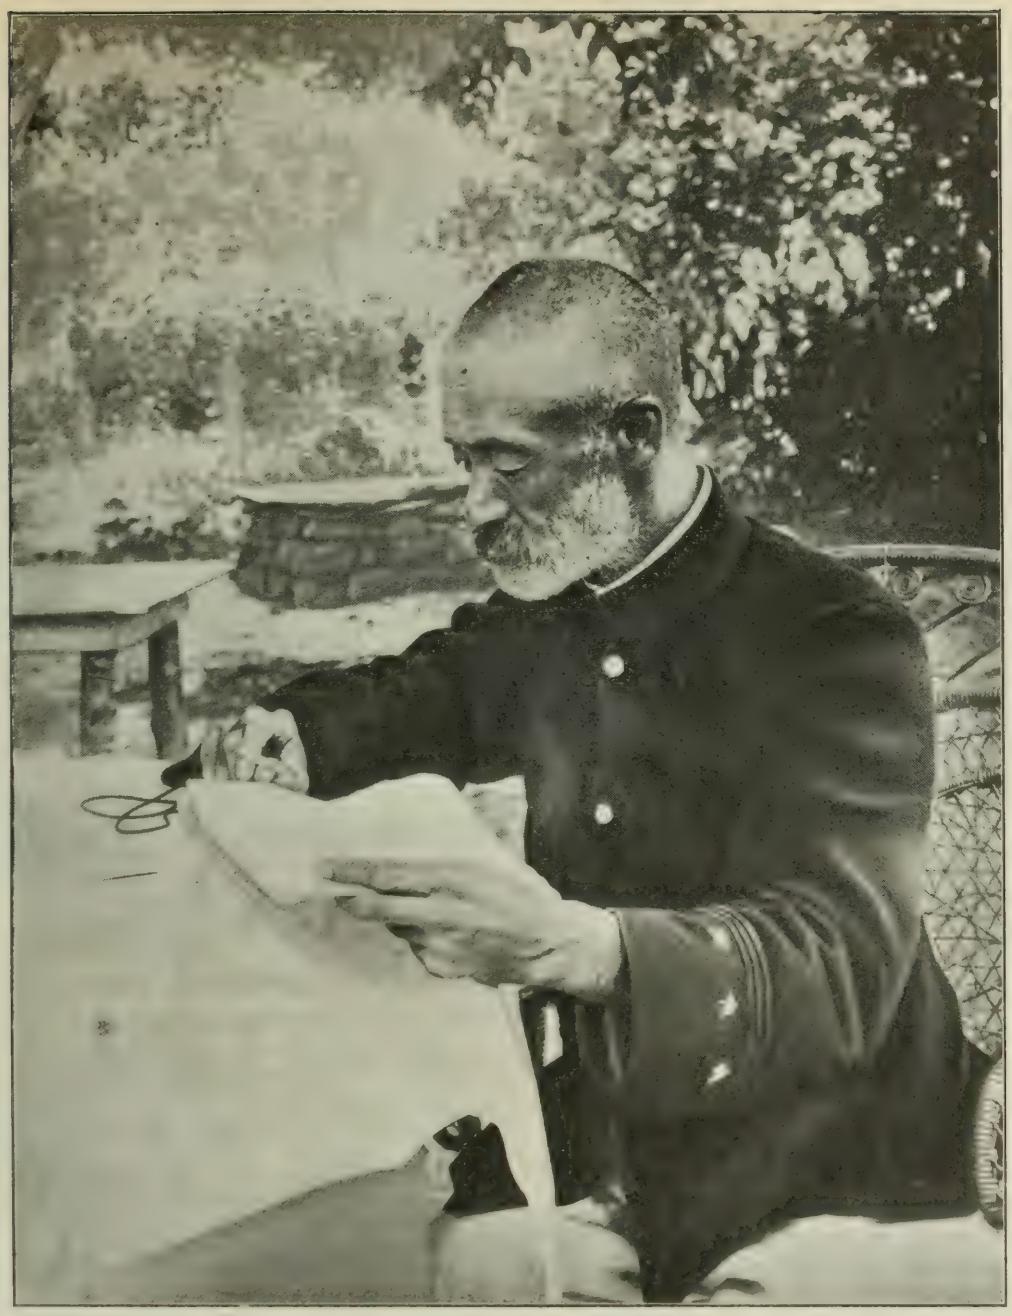
The Siege of Port Arthur

At last the fog has lifted about Port Arthur. The Japanese censor has permitted the publication of a rather complete narrative of the military operations from August 7th to the present time, apparently thinking that the fall of the fortress is so near that further concealment of the movements is unnecessary. The first task of the Japanese was the

reduction of the chain of outlying forts, which extended in a semicircle fourteen miles long from coast to coast around Port Arthur and four or five miles distant from it. (Not represented on the map, but somewhat further out than the line of the Japanese intrenchments.) On the northeast Port Arthur is protected by a high ridge, on which are the Orlung and Keekwan Forts. To the east of this are the Taku and Shaku Mountains (Takushan and Shakhushan), 600 feet high, precipitous and strongly fortified. On the night of August 7th the Russians were driven from these positions, altho the Japanese were not able to occupy them because they were under the fire of the ridge forts. But the Japanese were now able to establish their lines on their left between these hills and the ridge, as shown on the map. The Japanese lost 14,000 men in this attack. The

Map of Port Arthur, Showing the Main Lines of the Japanese Intrenchments.

heavy siege guns were then brought to the front and placed in sheltered and concealed positions on the hills to the north of Port Arthur, in preparation for an attack along the railroad down the Shuishi Valley by the center, and on August 19th the bombardment began. The village of Shuishi was defended by four advance forts in the shape of hollow squares connected by bomb-proof trenches and protected by a twenty-foot moat. These, like the other Russian outposts, were defended by wire entanglements made of quarter-inch steel, and in some cases charged with electricity of high voltage. These were stormed and the Russians driven back on the second line of forts (East and West Banjusan) north of Rihlung Mountain. These forts offered much more efficient resistance and all attacks failed until on the 21st, in the absence of General Nogi and without special orders, a Japanese regiment charged up the hill in small squads and a Japanese officer planted his regimental flag on top of the wall of the East Banjusan fort, tho he was at once riddled with bullets. His men then jumped over the wall and drove out the Russians with the bayonet. Here, however, the advance posts of the Japanese center, occupying the apex of the angle which pierced the Russian lines, were subjected to flank attack from the Keekwan and Antszshan forts. The fire was directed at night by powerful searchlights, and the slaughter during the six days' fight was terrible. One Japanese regiment lost 2,500 men, only 200 men and six officers surviving. Nevertheless the ground gained was held and the Japanese fortified on the lines indicated on the map, from which they pushed steadily forward by trenches, mines and charges. On September 20th the chain of forts across the Shuishi Valley between the Antszshan forts and Rihlung Mountain were assaulted and carried with the aid of scaling ladders, hand grenades and dynamite. In some cases a storming party of Japanese exposed for ten minutes to the furious shrapnel fire of the Russians were destroyed to a man. As the last trenches were carried the fighting was done with bayonets, swords, stones and hand grenades. No quarter was given on either side and white flags were disregarded. There is no definite information as we go to press of the extent to which the fortifications are in the hands of the Japanese, but they are said to have captured some of the Keekwan forts and the slopes of Orlung and Rihlung Mountains. These ridges dominate the city and harbor and upon their capture the Russians are expected to take refuge on the Tiger's Tail or at Lian-tie-shan for a last stand.



General Nogi, the Arbiter of the Fate of Port Arthur

BY ADACHI KINNOSUKE

ONE day—it was toward the close of the fifth moon of the thirty-seventh year of Meiji (that is to say, 1904 of the year of Christian grace)—General Nogi received a message from His Majesty the Emperor. It was the pleasure of His Majesty so the message ran, to confer upon General Nogi the highest distinction for the fighting men of Nippon. His Majesty appointed him as the Commander-in Chief of our forces besieging Port Arthur. General Nogi was happy. On the same day came the news of the battle of the Nanshan. To General Nogi the report of the Nanshan battle brought the news of the heroic death of his son Shoten. The General said:

"I am glad he died so splendidly. It was the greatest honor he could have. As for the funeral rites over his memory, they might as well be postponed for a while. A little later on they may be performed in conjunction with those of the two other members of his family—of Hoten, his brother, and of myself."

General Nogi is the type of soldier

GENERAL NOGI

This portrait of General Nogi was made from a photograph taken on September 13, 1904, while he was preparing for the great attack which is now being waged on Port Arthur. This is the most recent photograph of the General made at his headquarters and has not been before published in any magazine. From Stereograph Copyright, 1904, by Underwood & Underwood, New York

upon which the ideals of the elder days of the samurai would look down with pleasure. Some say he is somewhat out of place in the waking days of the new century. Simple, with that rugged simplicity of a man who is too great for adjectives, his heart is in somewhat greater things than the polite accomplishments of the day. Both his friends and foes have styled him a peculiar man. He is peculiar in many things. He is peculiar in his conception of the life of a soldier. In these happy days, when the soldiers of so many countries all over the world are given to the gold cloth and parade, he has put his conception of the soldier in the following sentences:

"A soldier is a soldier, after all, and after a man becomes a soldier he must be perfectly willing to lead a life that is somewhat different from the life of an ordinary man in society. It is impossible for him to enjoy liberty and wealth such as so many of his fellow men seem to enjoy. . . . I refer to this point more especially because of a simple fact—namely, that the soldier who would perform his duties with credit on a battlefield must, of necessity, have trained himself to perform all that is expected of him in the days of peace. There ought not to be any neglect or any defects in his daily life. The conqueror of himself in the

time of peace must be a man if he would aspire to the honor, with any right, of being a fighting man under the Sun-flag."

Unlike so many historic men of fame, who make free gifts of splendid precepts and glittering periods and straightway forget those beautiful virtues in the doings of their daily life, the General did not stop with mere words. There is a famous story told of him of his love for shojinryori. (Now, shojinryori means the food prepared for priests and monks). It was upon his return from Formosa. He was appointed the Commander of the Eleventh Division, stationed at Zentsuji, in the Province of Sanuki. The division in question was passing through the busy period of organization. Devoted always, first of all, to his duty to the state, the General left his family in Tokyo. Only three servants accompanied him. Not far from Zentsuji there is a modest village called Kinzoji Mura; in the village stands a humble temple called Kinzoji, after which the village is named. The General found a little corner in the temple which never was meant to entertain any one or anything more pretentious than an "out-of-the-world," as the monk is called in our country—a man absolutely indifferent to the luxuries of this life. There was a young priest in the temple who did the cooking for every one who stayed on the compound. Upon the food, which is simple beyond all the dreams of simplicity, the Commander of the Eleventh Division sustained his life. For four years he lived upon the simple food of the monk.

As soon as the news of this rigorous simplicity of diet reached his family at Tokyo Mrs. General Nogi wrote him at once advising him of her visit to the distant post. As she looked upon it, it was a crime that he should allow himself, in his devotion to the simplicity of life, to do a permanent injury to his physique and health through the coarse food prepared by the monk. Without waiting for the answer from the General she started in company with their son Hoten, taking the first train that left Tokyo. If the General were to live so rigorous a life in his devotion to duty that called him she certainly was entitled to share. Of one thing else she was sure, she should aid to moderate the hardship of life for him. Happy in the conviction, she spent some four days on the trip and at last found him living a full-fledged ascetic. The General declined this kindly offer point-blank. The pleasure of a home life, he said, was beyond his ability to enjoy in these days of crowded duties, and in spite of the strong persuasions of the officers under him, especially of Major Ashiwara, the General begged his family to make their way back to their Tokyo home.

If the General does not take very enthusiastically to wine, women and the social graces of a ballroom, if he carries about him the reputation of being simple to the point of ruggedness, it must not be forgotten that he has never been recreant to the old ideal of the samurai. He is a scholar before all things, a gentleman as well as a soldier. A classic Chinese poem is upon the lips of the cultured Nippon of to-day. Men do not seem to be able to repeat its lines with dry eyes, without chokings in their throats. The lines begin:

"Sei ba susumazu hito katarazu," etc

They were composed just outside the castle walls of Kinchau, under the shadow of the Nanshan, made sacred by the heroic memories of Nogi Shoten and his comrades, and the author of these lines, the pathos of which had melted the heart of the entire country, is General Nogi. The lines have passed into history. More, they have passed into the rare and goodly company of the Japanese standard literature.

Perhaps the greatest monument that the General has built unto himself was the work he has done as the Governor-General of Formosa. The work accomplished when the General returned home, the men who knew what the Formosa of scarce ten years ago was marveled at the miracle wrought by the genius of Nogi. If there be any colonial powers in the world who could teach a few things to General Nogi to his profit they have not given as yet the slightest sign of their ability.

On the historic 6th of June, 1904, on the day when Togo, Nishi, Yamamoto and the rest of the distinguished company were promoted, Nogi was given the full rank of General.

New York City.

The Value Rank of the American People

BY EDWARD ALSWORTH ROSS, PH.D.

[Dr. Ross was formerly Professor of Sociology in Leland Stanford, Jr., University and now occupies a similar chair in the University of Nebraska. We expect to follow this article with several others from his pen.—EDITOR.]

HOW much is the present enviable position of America due to the qualities of her people, how much to the rich land they have occupied and to the beneficent institutions they have inherited? While not belittling the favor of environment and institutions, we have ground for thinking that if in 1800 or 1850 this country had contained instead of its then population an equal number of average English or French or Germans its progress would have been less rapid than it actually was. The anthropologist thinks he can perceive a distinct American type, the formation of which he would attribute not to climate or crossing of strains, but to the same process that creates improved varieties of domestic plants or animals—viz., *selection.*

The American strain originated in the spontaneous influx of Europeans. Before the days of assisted or artfully stimulated immigration the tearing up of roots in the Old World home required unusual hardihood and enterprise. It implied not only self-reliance and faith in the unknown, but great readiness to take risk. To the wilderness to cope with nature and the savage go not the brainiest or noblest or highest bred, but certainly the strongest and most energetic. The weakling and the sluggard stay at home, or, if they are launched into the frontier conditions, they soon go under. The tests to which pioneers are subjected are much more searching than those of an old society and the death-rate is higher. A differentiated society shelters and carries along many ill-adapted that cannot stand the rude buffets of life as isolated farmers clearing the forest and planting crops among the stumps. The hardships of pioneer life pitilessly screened out the weak and debilitated, leaving only the hardy and vigorous.

To-day the lure of America is chiefly economic. But the early comers panted for something else than easy bread-winning. They sought escape from the confinement of crusted-over societies. Too independent in spirit to crouch and fawn and prosper, they preferred the hardships of this untamed land to the dictation of priest and squire and drill sergeant and employer. The clingers abided at home, but the stalwarts came for freedom's sake, and when, even here, society began to close about them and to crystallize they pushed farther into the wilderness. To-day among the *vortrekkers* of population in the valleys of the Rocky Mountains you find eagle-faced men who remind you of Vikings, men like the "terrible and self-reliant warriors of the Scandinavian sagas, like Ragnor, Lodbrog or Egil, son of Skallagrim, who did not regard even the gods, but trusted to their own might and main." In the last and westernmost decanting of our people this impatience of restraint becomes almost a malady. In accounting for the dislike of Arizonians for the United States soldiers, Owen Wister says:

> "The unthinking sons of the sage brush ill tolerate a thing which stands for discipline, good order and obedience; and the man who lets another command him they despise. I can think of no threat more evil for our democracy, for it is a fine thing, diseased and perverted—namely, independence gone drunk."

The energy and spirit of the original European element have been intensified by the innumerable internal migrations that have carried the white race entirely across the Continent. It is the more ambitious and spirited that have "gone West," and since the younger and more flourishing communities have had the higher rate of natural increase a large part of the American element in our population are descended from men who had the mettle and pluck to become pioneers.

What now are the salient traits of the type thus formed?

The natural physique of the American

breed is superior to that of European. Even in the sixties, after the average physique of the nation had suffered through the infusion of great numbers of low-grade immigrants, the measurements showed the native-born volunteers to be an inch or an inch and a half taller than the foreign-born. The foreign-born, in turn, appeared to be taller than the people from which they sprang. It was found, moreover, that recruits hailing from other States than those in which they had been born were generally taller than those who had not changed their residence. Comparative weights tell the same tale. The recruits from New England weighed 140 pounds; the Middle State men, 141; Ohioans and Indianians, 145, and the Kentuckians, 150. This law that the physically superior migrate is curiously borne out by the case of Sardinia, where the population is the leavings of continued migration and the stature is extraordinarily low.

A report on the volunteer soldiers of the war says:

"The physical qualities which fit the American for military service consist not so much in muscular development and hight as in the toughness of his muscular fibre and the freedom of his tissues from interstitial fat, whereby active and prolonged movements are much facilitated."

Our people, moreover, are singularly free from blood taints. One cannot live in Central Europe without observing that the signs of rachitis, scrofula and syphilis are much more numerous there than they are here.

As regards American character, there is no question that its salient trait is energy of will. We see it in the saurian ferocity of business competition, in the whirl of activity that leaves neurasthenia, heart failure and Bright's disease in its wake, in the reluctance to "retire" betimes, in the killing pace of our workingmen, in the swift conquest of the wilderness, in our faith in efficiency as the only goal of education. No people pardons more to the successful man or holds the persistently poor in such pitying contempt as weaklings that cannot get into the game. In the American action prevails over imagination and reflection. He is the true anti-Buddhist, the Occidental raised to the nth power. Hence the American rocking-chair, solace of the overtired. Hence "time is money," "boil it down," "twenty minutes for dinner," etc. The magazine article is read instead of the book, the paragraph instead of the editorial, the scare-head instead of the dispatch. To the women are relegated religion, literature, art, social elegancies—whatever, in short, demands repose.

The strong will heeds nothing but the goal. The high voltage American of the pioneering breed contemns hardship and risk, braves alike White Pass and Death Valley. In sport or in battle no one will stand more punishment than he. Body, appetites, inclinations—all are gripped in the iron vise of his will. Unsparing of himself, he is reckless in sacrificing others. His impulses are kindly, but wo to those whose rights or lives block his way!

The enjoying of things requires the passive attitude—letting things work on you. The reign of the active spirit therefore makes ours a producers' society rather than a consumers' society. We neglect no trifle that will lower cost, but overlook little things that add to comfort. In London there are hotels where the morning paper is warmed before it is handed to you. In Berlin there are restaurants where they give you an electric stirrer with thermometer inserted to bring your beer to just the right temperature. The New World for making money, the Old World for spending it. Hence the active come to us, the idle rich desert us. We do not learn to dawdle gracefully. An American crowd never effervesces with gayety like the holiday throng in Europe.

In this "hustle" civilization preoccupation and hard work damp lust, that canker of the pleasure civilization. The centers of infection are fewer, and the germs of lubricity can hardly live in this eager forenoon air. The sex life is not prominent in our manners and literature, the family is pure, and there is an Arcadian frankness between our young men and young women.

Guile is the resource of the feeble, the weapon of the downtrodden. The born American, on the other hand, feels able to win without stooping. Conscious of strength, he prefers to speak the truth and play fair, not as something due to others, but as something due to himself. Yet

for all that he owes it to himself to succeed. Where business or political competition becomes fierce this native morality is, therefore, compromised by the determination to succeed at any cost. Hence a queer, ring-straked conscience that does not stick at corruption, fraud and grand larcency, yet keeps faith with foes and warns before striking.

In point of intellect Americans are not clearly differentiated from the mother stocks. Altho free from the ox-like "man-with-the-hoe"—that sort finding here no chance to survive or mate—we must not impute to ourselves unusual mental capacity. The change a few years of our electrifying ozone works in the dull, fat-witted immigrant suggests that our proverbial alertness, cleverness and lucidity betoken stimulus rather than brain power. It is, after all, the high peaks that count, and no one is so rash as to assert that our crop of geniuses per million is heavier than that of Scotland or Switzerland. It is only by counting in our inventors—mostly mechanical—and our captains of industry that we can offset our deficit of eminent men in literature, art and science.

Albeit we travel on a rising curve of civilization, anthropologically we are at our zenith, for the westward shifting of people has slackened, and the tonic selections of the frontier have well-nigh ceased. Indeed, it is quite possible that in 1860, before the Great Killing and the Great Dilution, the human stuff here was some carats finer than it is to-day.

The Civil War cost half a million men well above the average in physique and spirit. The South lost her flower. In the North the impulsive were decimated, while the calculating stayed at home and multiplied. Had this splendid half million lived the Old World would not have peopled the trans-Mississippi region, and the nomenclature of many a Western town would be different to-day. The blood of the nation was lastingly impoverished by that awful hemorrhage. The cheap stucco manikins from Southeastern Europe do not really take the place of the unbegotten sons of the granite men who fell at Gettysburg and Cold Harbor. Had this sterling humanity not been squandered would the South be so hysterical or the North so graft-rotted as is the case to-day?

Then came the Great Dilution to pull down the average.

The flood of immigration now flows from different sources, and taps lower human levels than the earlier tide. Overpersuaded, from Croatia and Dalmatia and Sicily and Armenia, they throng to us, the beaten members of beaten breeds, often the more aboriginal men that have been elbowed aside or left behind in the swayings of the mightier European races. Do these Slovaks and Syrians add as much to the strength of the human piers that support our civilzation as Scotch-Irish or Scandinavians? As undersized in spirit, no doubt, as they are in body, the later comers lack the ancestral foundations of American character, and even if they catch step with us they and their children will, nevertheless, impede our progress.

The inrush from the lesser breeds has not stayed the march of industry or commerce or science or education, for these are in the capable hands of picked man. But the newcomer counts one at the polls, and hence it is in our politics that the sag is most evident. The higher types of men are prompted to act together, because they believe in the same principle or love the same ideal. The inferior pull together from clannishness or allegiance to a leader. The growing disposition to rally about persons and the rising value of the saloonkeeper, the ex-pugilist and the boss in controlling city voters would indicate that the electorate has been debased by the too free admission of political incapables.

The strife between labor and capital has been aggravated by ethnic difference. The employer has been more haughty, the employee more turbulent, than if they had stood on one race plane. Caste widens the gulf between them and the Edenic reasonableness of the Antipodes is hardly for us to hope.

Dilution, however, need not spell decline. The psychology of the superior third of a people creates the spirit which ultimately comes to dominate the rest. It gives rise to ideals, which, under the pressure of divers social atmospheres, penetrate to the soul's marrow and become a second nature. This is why, despite the swelling influx of the inferior, that emanation of the pioneering breed, the American spirit, is still clear, strong

and triumphant. Never has the psychic whirlwind here had more power to seize and bear aloft lowly men than it has today.

Free land is gone, however, and the fact that nowadays the hegira of the ambitious is all to the man-stifled town instead of to the spacious, prolific frontier may be fateful for the American element in our population. The great glittering cities attract the brightest youths from the farms and tempt them to strain for the prizes of success. But what with shortened lives, bachelorhood, late or childless marriages, and small families, the cities constitute so many blast furnaces where the talented rise and become incandescent, to be sure, but for all that are consumed without due replacement. Thus may run down a race keyed up by the migrations of more than two centuries. War lowered the standard of admission to the French army three and one-third inches between Louis XIV and the Third Republic, but in the meantime siren Paris lowered still more the spirit of initiative of the French. Unless our successful ones hearken betimes to the gospel of the simple life the afternoon spirit is sure to creep upon us at last.

LINCOLN, NEB.

The French and American Presidents

BY THEODORE STANTON

[The author of this article has resided in New York and Paris alternately for several years, and takes consequently a Franco-American view of things which gives an originality to his opinions and estimates.—EDITOR.]

IT has so happened that I have seen all the Presidents of the third French Republic, with the single exception of Thiers. But as I collaborated in a Life of that statesman, and have met many of his friends, I feel that I have a certain acquaintance with him. I have not simply *seen* MacMahon, Grévy, Carnot, Casimir Perier, Félix Faure and the present occupant of the Elysée Palace, M. Loubet, but I have conversed with all of them, with two exceptions, on more than one occasion, and have studied all of them under varied circumstances. I can say, therefore, that I have a pretty good idea of what the French President is like, how he looks, talks and thinks.

It also happens that I have had a similar glance and brief conversation with a half dozen American Presidents, with Grant, Hayes, Cleveland and the present incumbent of the White House.

I propose in the following paragraphs to sum up some general and personal impressions resulting from the foregoing facts.

In this estimate Thiers and MacMahon may be left quite aside for reasons unnecessary to go into here. With the advent of M. Grévy at the Elysée the Third Republic may be said to have been practically founded. To my mind, Grévy was the best President France has had, and the nearest approach, in ways of thought, dress and general conduct, to our own Chief Magistrate. His immediate successors—Carnot and Casimir Perier—men of more culture and better birth, were more like our earlier Presidents from Washington down to John Quincy Adams. Félix Faure, perhaps the first really self-made man of the Third Republic, who had not even the advantage of possessing a university degree, so inseparable from the modern Frenchman who comes to the fore—Félix Faure should have turned out to be "the American President"—this term is frequently employed in France to-day *par excellence*. But he became so dazzled by his lofty surroundings that a rather unbecoming death prevented his polished career from ending in universal ridicule. M. Loubet was a great improvement on Félix Faure. He is almost a second Grévy, and the Elysée is once more somewhat like our White House, tho the two Presidents and the two Ex-

ecutive Mansions are very different in many respects.

When M. Loubet goes out for a walk in the Champs Elysées, he is attired in frockcoat, silk hat and light gloves, as if he had just come from, or was going to, some smart afternoon tea. Two years ago I noticed Mr. Roosevelt start out from " the temporary White House " for an afternoon ride dressed in almost semi-cowboy costume. M. Loubet always holds his Cabinet meetings in this same invariable black frockcoat, which he scarcely ever puts aside except to don evening dress. Mr. Roosevelt, however, is seen on Cabinet Day in morning dress and gives luncheons in the same attire.

When M. Loubet starts to escape from Paris for a little outing in his native village and on his mother's farm, he is met at the railway station of Paris, both going and coming, by a half dozen of the highest officials of France, who receive him with marked formality. How Mr. Roosevelt goes from Washington to Oyster Bay and back, your readers know without my offering them any description of this simple journey. M. Loubet travels almost like a king, Mr. Roosevelt almost like a private citizen.

It is a very common thing for persons who wish " to pay their respects " to be received in the cabinet room of the new executive offices at Washington just before the Secretaries and the President sit down for consultation at the Council Board. For anybody but a minister to enter the council chamber of the Elysée Palace is an unheard of thing. The French public is admitted to no part of the Elysée Palace, and to obtain an audience of the French President, who really has next to nothing to do, is a matter of much loss of time and correspondence.

Last month a distinguished French statesman was presented to President Roosevelt, who, thereupon, began to converse with him, in the French language, on all imaginable topics, citing French books, newspapers and periodical articles, mentioning a half dozen names of leading and even almost unknown authors and thinkers, and winding up by inviting his astonished listener to lunch with him a few days later. At this second meeting the same course was pursued. Innumerable questions, political, financial, artistic, social, etc., were taken up and considered in all their bearings. The President spoke with much volubility. He questioned his guests and answered their questions. The conversation was long and interesting, the President evidently exerting himself to entertain his visitors.

Two or three years ago President Loubet received officially a committee of ten gentlemen of some six or seven different nationalities, who, after a protracted deliberation, had unanimously voted that the next Olympic Games should be held this summer at St. Louis, which has since been done. We were presented to the President, one after the other, the nationality of each visitor being mentioned. We remained with M. Loubet perhaps ten minutes, during which time he gave us a detailed account of a recent experience of his in a submarine boat at the Toulon Navy Yard. Nothing was said of athletics, the subject naturally uppermost in the minds of the visitors. Neither in receiving nor in bidding us good-by, did the President say a word about any one of our respective countries. To the American delegate especially no reference was made to the coming Exposition which was to celebrate a great Franco-American event, nor to the fact that the Games were to occur there. M. Loubet's conversation from beginning to end might have been addressed as appropriately, or, rather, as inappropriately, to a committee representing any interest whatsoever with the exception, perhaps, of naval interests. We left the Elysée Palace that morning not knowing exactly why we had gone there, and as I write these lines it is impossible for me to imagine an American President, and especially Mr. Roosevelt, receiving even a delegation of school boys in such an inappropriate and meaningless manner.

New York, November, 1904.

Papyrus Digging with Grenfell and Hunt

BY EDGAR JOHNSON GOODSPEED

[The author of the following article is Assistant Director of the Haskell Oriental Museum of the University of Chicago, and is associated with Messrs. Grenfell and Hunt in the editorship of the "Tebtunis Papyri," Volume II.—EDITOR.]

"UMM-EL-BARAGÂT, Feb.

"Dear Goodspeed: The bearer of this, Mohammed Mansoor, has come in to Medinet to buy planks, and will return to Damian in the same train as you. There will be a camel waiting which will take your luggage. Come on yourself in advance with one or two of the men. Yours, B. P. GRENFELL."

AS I took my seat in the little narrow gauge train that runs from Medinet-el-Fayûm to Damian, on a February afternoon in 1900, a towering Arab accosted me and handed me this note. He was a striking figure; tall, bare-footed, dressed in a long blue garment and wearing a white turban. He had found me easily enough, no doubt, as I was the only Northerner in Medinet that day. I had broken off some work in the Gizeh Museum to accept an invitation of long standing to visit the Oxford excavators in their tents at Umm-el-Baragât,—a site since made historic by the extraordinary Ptolemaic finds of that season. I had left Cairo early that morning, and reached Medinet in time to lunch there and wander over the ruins of Arsinoe, before taking the train for Damian.

Dr. Hunt and Dr. Grenfell in Camp

Ruins of Arsinoe

the nearest railroad station to the camp.

Darkness had fallen when Mohammed Mansoor and I descended at the utterly desolate and houseless point where the camel and the workmen were waiting. A man and a boy were waiting for us and we set off at once at a rapid pace for the camp. That was a memorable walk, under the stars, along the edge of the cultivation, then over the hard surface of the desert, my three guides chattering in Arabic with the glee of children. I soon found that they knew nearly every archeologist in Egypt, and it occurred to me to ask whether they knew Professor Petrie's redoubtable head-man Ali. A stentorian *Aiwa*,—"yes"—burst instantly from all three, and they made haste to add with evident pride that the boy was Ali's brother. They carried me over canals on their shoulders, led me by the hand when it was very rough and closed in a solid group about me when the dogs of each village or hamlet rushed out upon us. In an hour's time we were at the tents.

There were four of these, the cook's, Mr. Grenfell's, Mr. Hunt's, and a guest's tent; the men lived in shelters of their own construction near by, or returned at night to the neighboring villages. My hosts met me with a cordiality I had previously experienced both at Oxford and at Cairo, and we sat down to supper in Grenfell's tent, surrounded with the supplies and the trophies of the expedition. With the greatest interest I learned of the success that had attended the season's digging, and looked around upon some of the things exhumed. Both men then felt that even their famous season at Oxyrhynchus (since then, indeed, eclipsed by a second winter's digging there) had been surpassed by the great Ptolemaic finds they had made in the crocodile cemetery at Tebtunis.

With the first light of morning the camp was astir. Breakfast was in Grenfell's tent at 7.20, and a few minutes later I was on my way with him to the "field," half a mile away, where one hundred and forty men were at work. They were digging the old Ptolemaic cemetery, and already hundreds of openings scattered over the face of the desert showed the course of the excavations. The men and boys worked in pairs, each with the mattock and wicker basket that are the fellah's invariable implements. As fast as one pit had been exhausted another was begun, while one or the other of the directors of the work moved constantly from group to group, inspecting each hole, directing the abandonment of this or that unpromising spot, and pointing the men to new ground. It was an interesting scene, with the picturesque fellahin scattered over the desert, busily at work.

We returned to the camp for lunch,

and again for tea at four o'clock. Meantime I was shown a splendid series of 700 Roman papyri already separated—"damped out" is the technical term—numbered and laid away between sheets of paper, in large tin boxes, there to remain until taken up at Oxford for

An Egyptian Train

decipherment and publication. These had been found, as not a few papyri have been, in the sand-strewn ruins of an ancient house, abandoned centuries since as the desert encroached upon the cultivated land where it stood. The camp lay a little distance from the cultivation, the four tents arranged in a sort of crescent. The three larger ones were of the type called "Egyptian officer's tent," with six-foot walls, twelve-sided and lined. The fourth was about ten feet in diameter, twelve-sided, with three-foot walls. The Oxford men declared this desert life four months in the year an ideal rest and tonic; and it may help to explain the really extraordinary amount of work they succeed in doing in the remaining eight months of each year, when from one to three quarto volumes of texts, aggregating sometimes a thousand pages, are brought out of their work rooms in Queen's College.

Many of the workmen had been with Grenfell and Hunt in previous seasons digging, and had acquired no small degree of skill in the work. Others were "locals,"—natives of neighboring villages, who had been taken on. When we came out of the tents in the morning more than a hundred of these fellahin from round about were gathered, waiting silently to be employed. Of these Grenfell chose eight or ten, and the rest picked up their tools and departed, to reappear next morning on the same errand.

The most striking feature of the season's work at Tebtunis was the finding of mummified crocodiles wrapped in Greek and demotic papyri. The crocodile was much venerated in the Fayûm; Crocodilopolis was the capital of the

nome; and in 1888 Professor Petrie found near Hawara an extensive cemetery of sacred crocodiles. The novel thing about the thousands of crocodile mummies unearthed at Tebtunis, however, was that many of them were wrapped in long pieces of papyrus or papyrus-stiffened cloth. Mr. Grenfell has since graphically described the incident that led to this curious and resultful discovery: "The tombs of the large Ptolemaic necropolis and adjoining the town proved in many instances to contain only crocodiles, and on January 16th, 1900, a day which was otherwise memorable for producing twenty-three early Ptolemaic mummies with papyrus cartonnage,—one of our workmen, disgusted at finding a row of crocodiles where he expected sarcophagi, broke one of them in pieces and disclosed the surprising fact that the creature was wrapped in sheets of papyrus."

The sacred animal of Sebk was naturally much in evidence about the camp. On the sand floor of my tent were a few baby crocodile mummies; others were about Grenfell's tent; around the tents were piled mummies of men and crocodiles, and a storehouse of mud-brick and planks, the "crocodile house," was in process of construction behind the tents. The mummifying proclivities of the Ptolemaic Tebtunites must have been insatiable, for numbers of sham mummies were found, consisting of some eggs or a bone wrapped up to look like a crocodile, and duly interred.

My second morning at the camp was divided between the Coptic church and the "field." The church, to which Hunt took me after breakfast, had been uncovered in the earlier part of the excavation. Its ruined walls still exhibited some curious old paintings of saints and dragons. After an hour among the neighboring ruins I rejoined Grenfell in the necropolis, where the digging was being vigorously pushed. At eleven o'clock I took leave of my hosts, and with Mohammed Mansoor as my guide, left the little cluster of tents and set off for the railroad for the journey to Medinet and Cairo.

Dr. Grenfell in the Field

The excavations of 1900 were conducted for the University of California, at the expense of Mrs. Hearst. The great treasure of papyri secured will thus ultimately find its way to Berkeley, and constitute the first great papyrus collec-

tion to reach this continent. Already a ponderous volume of some 700 pages has been published by the discoverers upon the first part of the Ptolemaic papyri found. The Roman papyri will fill another volume, and the remaining Ptolemaic pieces a third. The yield of that single season will thus require some 1,500 pages for its initial, and by no means exhaustive, publication, while its contribution to our knowledge of the history, administration, and life of Ptolemaic Egypt will be remarkable. It should be a source of satisfaction to Americans that this, the finest collection known of Greek papyri of the Ptolemaic period, is to belong to an American university.

CHICAGO, ILL.

The American Invasion and Central Europe

BY DR. JULIUS WOLF

[Dr. Julius Wolf was born in Brünn, Austria, and acted as Professor of Political Economy in Zurich University from 1885 to 1897, since which time he has been a Professor in Breslau University. His works have been translated into many foreign languages but not into English, and deal chiefly with indirect taxation. In 1884 he published a valuable work on the subject of the tax on brandy, and as a consequence he was invited in 1885 to organize the brandy monopoly, or Trust. This organization has been widely copied throughout Europe. Professor Wolf was also invited to suggest a method of regulating the issuance of bank-notes in Switzerland, after his publication of a work on that subject. He was also intrusted with the development of a plan for high schools for political and legal science. In 1886 he published a book on East India's Competition in Grain. He then passed on to the consideration of social questions, publishing a book which has been widely discussed on a "System of Social Politics." This book is still regarded as his chief work, and in it he combats the so-called "Improvement Theory" of pulpit-socialism and the doctrine of a rising social development. This book was the first comprehensive attack in Germany upon Karl Marx's "Capital." In 1901 he wrote a book on "The German Empire and the World Market," already translated into French. Here he calls attention to the American danger threatening Central Europe, and cites the means by which these States can ward it off. Here lay the germs afterward developed into the Union for the Advancement of the Commerce of Central Europe.—EDITOR.]
